SELECTED WATER RESOURCES ABSTRACTS

VOLUME 3, NUMBER 21
NOVEMBER 1, 1970

LIBRARY OF THE

W70-08585 -- W70-09010

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign), single copy price is $3.00. Certain documents abstracted in this journal can be purchased from the Clearinghouse at the prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 21
NOVEMBER 1, 1970

W70-08585 -- W70-09010

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

r sale by Superintendent of Documents, US vernment Printing Office, Wash, DC 20402 - ce $0.45. US Office of Saline Water Research l Development Progress Report No 558, 1970. p, 10 fig, 2 tab, 20 ref. Contract No 14-01-0001-96 OSW.

scriptors: *Water structure, *Water properties, drogen bonding, Thermodynamic behavior, scosity, Melting, Freezing, Boiling, Laboratory ts.
ntifiers: *Anomalous water, Polywater.

e preparation and certain properties of anoma- s water were investigated. Anomalous water was med in quartz and Pyrex capillaries, particulate ds, and on flat plates. Samples as large as 3 mg re made in a single operation. A quantitative ex- ession was given to express the anomality of a en sample on the basis of its expansion charac- tistics. The formation of anomalous water and its ative stability were explained on the basis of gular solution thermodynamics. Highly hydroxy- ed surfaces are required for its attachment and mation. Most anomalities can be explained by excess of nonhydrogen-bonded close-packed ucture in the water. The entirely anomalous ter represents this structure without the esence of an ice-like hydrogen-bonded structure. is explains phenomena such as the expansion aracteristics and phase behavior, and gives infor- ation in regard to formation and preparation. 2A. General

WATER BALANCE IN NORTH AMERICA,
Arleigh H. Laycock, Martha Francisco, and Thelma Fisher.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, 2969. 335 p.

Descriptors: *Conferences, *Water balance, *Regions, *United States, Hydrologic budget, Hydrologic cycle, Rainfall-runoff relationships, Surface-groundwater relationships.
Identifiers: *Canada, *North America.

The water balance of North America was discussed in a symposium of 8 sections comprising 34 papers. The topics of the sections are: regional water balance patterns; local patterns; streamflow and groundwater; water balance modifications (regime and quality, yield increase, utility increase, and legal responsibility); research programs, and research needs. (Knapp-USGS)

THE AVERAGE ANNUAL WATER BALANCE OF THE WORLD,
Delaware Univ., Newark. Dept. of Geography, and Thornthwaite (C. W.) Associates, Elmer, N. J.
John R. Mather.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 29-40, 1969. 12 p, 2 fig, 7 tab, 15 ref.

Descriptors: *Water balance, *Hydrologic cycle, Runoff, Streamflow, Rainfall-runoff relationships, Climatology, Weather, Climates, Precipitation (Atmospheric), Mapping.
Identifiers: World water balance.

World maps of annual precipitation prepared by Geiger were analyzed to provide average annual values by 10 degree squares of latitude and longitude as well as by continent and ocean areas. The depth of runoff is greatest from South America, followed by Asia, Europe and North America in that order. Runoff from the North American continent is below the average from all continental land masses. New figures for global precipitation and evapotranspiration are utilized to evaluate the average annual hydrologic cycle. The results emphasize the small influence of local evapotranspiration in local precipitation. Quantitative estimates are mode of the mobility of moisture from oceans to land and back again in the atmosphere. (Knapp-USGS)

AN AVERAGE WATER BALANCE FOR CANADA,
Windsor Univ. (Ontario).
Marie E. Sanderson.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 41-54, 1969. 14 p, 9 fig, 8 ref.

Descriptors: *Water balance, *Regions, Climatology, Weather, Precipitation (Atmospheric), Runoff, Rainfall, Evapotranspiration, Gaging stations, Maps, Mapping, Streamflow, Hydrologic cycle, Hydrologic budget.
Identifiers: *Canada.

If long term average conditions are assumed, an annual water balance equation can be written for Canada. The average parameters in Canada's water balance are presented on maps. Such maps are tentative, based, except along Canada's southern border, on inadequate data. The precipitation map is based on average precipitation figures from some 2,000 Department of Transport climatic stations. Amounts of potential and actual evapotranspiration and water deficiency are obtained by the Thornthwaite water balance method assuming an average water holding capacity of the soil. The runoff maps are based on stream gaging data complemented by climatically determined figures of water surplus. Some estimates of volumes of runoff are obtained by planimetry. (Knapp-USGS)

WATER BALANCE PATTERNS IN THE CONTINENTAL UNITED STATES,
Geological Survey, Menlo Park, Calif.
John R. Crippen.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 55-61, 1969. 7 p, 2 fig, 1 tab, 5 ref.

Descriptors: *Water balance, *Water utilization, *United States, Rainfall-runoff relationships, Irrigation water, Municipal water, Industrial water, Discharge (Water), Streamflow, Runoff, Evapotranspiration.
Identifiers: U.S. water balance.

The conterminous United States receives as annual precipitation about 1,430 cubic miles of water. Of this, about 392 cubic miles leaves the national boundaries by entering the sea or by river outflow to other nations. Average precipitation ranges from 3 or 4 inches annually in desert valleys of the southwest to well over 120 inches in coastal mountains of the northwest. The one-third of the nation east of the Mississippi River receives everywhere more than 30 inches of precipitation annually. Average annual runoff to the Pacific Ocean is about 92 cubic miles, to the Gulf of Mexico about 191 cubic miles, and to the Atlantic Ocean or its tributaries about 109 cubic miles. Deficiencies occur most frequently in the agricultural regions of the southwest, where the annual precipitation is highly variable and irrigation practices require large quantities of water for use over large areas. Deficiencies in the eastern part of the country usually affect smaller regions where there is concentrated industrial or domestic use; therefore the greatest impact of shortages is upon the major metropolitan centers, particularly those in the densely settle coastal region from Boston, Mass., to Washington, D.C. STORAGE AND HYDROLOGIC PROCESSES,
Saskatchewan Univ., Saskatoon. Div. of Hydrology.
Don M. Gray, and D. I. Norum.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 151-162, 1969. 4 fig, 16 ref.

Descriptors: *Water storage, *Surface-groundwater relationships, *Rainfall-runoff relationships, Time lag, Routing, Soil moisture, Soil water, Groundwater, Surface waters, Groundwater movement, Water balance, Hydrogeology, Infiltration, Evapotranspiration.
Identifiers: *Basin yield.

The influence of the storage component on individual hydrologic processes in the water balance equation is discussed. Soil moisture content affects: (a) the time-variation, the depth and volume of infiltration and (b) the time-rate, distribution and amount of evapotranspiration by a given crop. Details are presented of the techniques and methodology to quantitatively evaluate the effect of soil moisture storage on these processes. Storage is also important to surface and groundwater flow systems. Particular emphasis is placed on the modulating and attenuating effect of storage on both peak flows and basin yield. Flow may be considered as a simple input-output system. Examples are given to demonstrate the effect of lag-time in simple mass balance or water balance equations. Additional discussions are directed to field methods of evaluating storage in these systems. (See also W70-08597)

POTENTIAL EFFECTS OF SPRINKLED AGRICULTURE ON THE NORTH AMERICAN WATER BALANCE,
California Univ., Davis. Dept. of Agricultural Economics.
David William Seckler.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 235-242, 1969. 1 tab.

Descriptors: *Water resources development, *Water conservation, *Water balance, *Sprinkler irrigation, Sprinkling, Water demand, Water utilization, Irrigation practices, Water consumption, Consumptive use, Water management (Applied).
Identifiers: North America.

Sprinkler irrigation constitutes 15 percent of the irrigated acreage of the western United States and is growing at an annual rate of 13 percent. This trend is likely to continue in the foreseeable future because of the profitability of sprinkler irrigation to agricultural firms. Because of the substantial savings in water under sprinkler irrigation, water coefficients used for planning future agricultural development in the western United States must be substantially reduced. The possibility of converting presently furrow-irrigated land to sprinkler systems, together with modern techniques of efficient furrow irrigation, may create sufficient water conservation to eliminate the need for large-scale water development in the foreseeable future. PRELIMINARY EVALUATION OF THE WATER BALANCE IN THE CENTRAL AMERICAN ISTHMUS,
Leif Ahlgren, Eduardo Basso, and Roberto Jovel.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 288-298, 1969. 5 fig, 19 ref.

Descriptors: *Water balance, *Regions, Hydrologic budget, Hydrologic cycle, Rainfall-runoff relationships, Evapotranspiration, Precipitation (Atmospheric), Streamflow, Groundwater movement, Runoff.
Identifiers: Central America.

Existing hydrologic and meteorologic data, although limited in quantity and quality, have enabled the preparation of a first preliminary quantitative evaluation of the hydrologic cycle for the Central American Isthmus. A detailed isohyetal map, covering the 1938-1967 hydrologic time period was prepared for the study area. Annual rainfall rates were found to range between more than 5000 millimeters in certain localized areas of central Costa Rica and Guatemala, and less than 1000 millimeters in Honduras and Guatemala. Pronounced dry periods occur, which has a direct influence on the distribution of runoff and on the amount of water consumed by permanent vegetation and crops. About 45 percent of the total rainfall runs off on the surface to the oceans, 48 percent is consumed by transpiration and evaporation, 7 percent flows out to the oceans through subsurface media. SOME CURRENT STUDIES OF LOCAL PRECIPITATION VARIABILITY OVER WESTERN CANADA,
Department of Transport, Toronto (Ontario). Meterorological Branch.
H. L. Ferguson, and D. Storr.
Preceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 80-100, 1969. 21 p, 15 fig, 1 tab, 23 ref.

Descriptors: *Distribution patterns, *Precipitation (Atmospheric), *Regions, Rain gages, Networks, Gaging stations, Water balance, Hydrologic budget, Runoff, Rainfall-runoff relationships.
Identifiers: *Canada.

The accuracy of areal estimates of precipitation for use in water balance calculations is discussed. Estimates from point measurements are subject to large errors due to problems of instrument design and siting. Areal variability is related to the form of precipitation, topographical factors, and whether the precipitation is of a showery or steady type. Some results of current Canadian studies are presented to illustrate these points. The error of estimate of areal precipitation over a given region is a function of network density and the accumulation period. This relationship is examined for two large areas, Southern Saskatchewan and the Lower Great Lakes-Upper St. Lawrence area. A map is presented showing the standard precipitation network density across Canada. (Knapp-USGS)

roceedings of Canadian Hydrology Symposium o 7, Victoria, British Columbia, scheduled for ay 14-15, 1969p held Oct 8-9, 1969, National esearch Council of Canada, Subcommittee on ydrology, p 311-343, Vol 1, 1969. 33 p, 11 fig, 4 b, 36 ref.

escriptors: *Satellites (Artificial), *Aerial notography, *Hydrologic data, *Surveys, Water sources, Snow surveys, Meteorology, ydrogeology, Glaciers, Thawing, Mapping.
entifiers: Canada.

ne latest developments in weather satellite chnology and the application of satellite photo-aphs to hydrology are reviewed. A comparison of tellite observations versus conventional observa-ons over Canada is made, based on data collected ver at least one winter. This comparison deals ecifically with basin snow cover, large scale ow-line observations and the break-up and freeze-up of large lakes. Weather satellite photographs are available in Canada on a routine basis and provide up-to-date pictures of the earth's surface as well as of cloud formations. While the photographs are used in many countries for weather analysis and forecasting, routine use of this new data source for hydrological purposes is still in the research and development stage. (Knapp-USGS)

RADAR AS A REMOTE SENSOR FOR HYDROLOGY,
McGill Univ., Montreal (Quebec). Dept. of Physics.
J. S. Marshall, and P. E. Carlson.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 261-281, Vol 1, 1969. 21 p, 9 fig, 1 tab, 11 ref.

Descriptors: *Remote sensing, *Precipitation (Atmospheric), *Radar, Synoptic analysis, Distribution patterns, Rainfall disposition, Weather, Climatology, Data collections, Weather patterns, Mapping.
Identifiers: Canada.

Radar yields a map over a large area, for a layer of atmosphere above the earth's surface, of the Radar parameter Z. There is a statistical relationship between Z and R, the rate of precipitation. For any single point on the map, radar can measure R to within 25 percent, and there is an uncertainty of 50 percent in the relation of Z to R. Expanding from a point to an area, performance improves considerably. Also, expanding from rate at an instant to amount over a period of time improves performance. Apart from use as a gage radar can give a very detailed qualitative pattern. (Knapp-USGS)

MODEL FOR CAPTURE OF RADIOACTIVITY BY PRECIPITATION,
Institute of Experimental Meteorology, Obninsk (USSR).
A. S. Avramenko, and K. P. Makhon'ko.
Journal of Geophysical Research, Vol 75, No 18, p 3613-3622, June 20, 1970. 8 fig, 21 ref.

Descriptors: *Radioisotopes, *Precipitation (Atmospheric), *Mathematical models, *Fallout, *Chemistry of precipitation, Dusts, Cloud physics, Sampling, Particle size.
Identifiers: Rainout chemistry.

A rough scheme for radioactive dust particle capture by rain droplets is presented. Processes taking place both within the cloud with regular updrafts and in the layer of the atmosphere below the cloud that lead to a definite distribution of specific radioactivity with droplet size are considered. Comparison of experimental data on the fission-product concentration in raindrops of different sizes with theoretical calculations allowed determination of the coefficient of rainout for removal of radioactive particles by cloud drops, corresponding to an inverse proportionality between concentration and cloud drop radius. The functional dependence obtained theoretically is in good agreement with the experimental data. The influence of the specific radioactivity distribution versus droplet size on the variation of the specific radioactivity during a short-range shower is considered. (Knapp-USGS)

STRONTIUM 90 FALLOUT DISTRIBUTION AT MIDDLE LATITUDES OF THE NORTHERN AND SOUTHERN HEMISPHERES AND ITS RELATION TO PRECIPITATION,
Institute of Experimental Meteorology, Obninsk (USSR). Hydrometeorological Service.
S. G. Malakhov, and I. B. Pudovkina.
Journal of Geophysical Research, Vol 75, No 18, p 3623-3628, June 20, 1970. 5 fig, 3 tab, 3 ref.

Descriptors: *Fallout, *Chemistry of precipitation, *Data collections, *Strontium radioisotopes, Sampling, Precipitation (Atmospheric), Synoptic analysis, Data collections, Mathematical models, Statistical models.
Identifiers: Radiological networks, USSR.

The dependence of Sr-90 deposition on precipitation within each 10 deg latitude belt was investigated. No satisfactory linear correlation was found for undifferentiated measurements obtained under different climatic conditions. Regions in which the data deviate systematically from the general trend of results in each latitude belt are singled out. A satisfactory linear correlation for most of the data was obtained between 50 and 60 deg N and for the first and second quarters between 30 and 40 deg N and 40 and 50 deg N. The third quarter is characterized by the largest deviations of the results from a linear dependence. The regression equations for the dependence of Sr-90 deposition on precipitation in each latitude belt are given. (Knapp-USGS)

2C. Snow, Ice, and Frost

GLACIER DISCHARGE SIMULATION,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
A. L. Derikx.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 143a, 1969. 1 p.

Descriptors: *Simulation analysis, *Glaciers, *Ablation, *Water yield, *Streamflow forecasting, Water balance, Melting, Precipitation (Atmospheric), Percolation, Runoff, Energy budget, Synthetic hydrology, Mathematical models.
Identifiers: Glacier discharges, Canada.

The flow of water from glacier drainage basin is defined by differential equations with boundary conditions similar to those of non-steady groundwater flow. Field data from Peyto Glacier, Alberta, Canada, are analyzed. In the heat balance only four terms have been considered: net radiation flux, sensible heat flux, latent heat flux and the heat available for melting snow and ice. The glacier is regarded as a lumped, linear system and meltwater is considered to percolate into this reservoir. The computation of outflow rates follows methods for non-steady groundwater flow to parallel drains based on the linearized Boussinesq's equation. One single parameter, defined as 'reservoir coefficient,' incorporates all hydrological properties of the glacier drainage situation. The principle of superimposition can be used to compute variations of outflow rate caused by variation of percolation. (Knapp-USGS)
W70-08608

2D. Evaporation and Transpiration

EVAPORATION IN TENNESSEE RIVER BASIN, 1935-1969.
Tennessee Valley Authority, Knoxville.

Tennessee Valley Authority Hydraulic Data, Branch Report No 0-6862, May 1970. 59 p, 2 plate, 4 tab.

Descriptors: *Evaporation, *Tennessee Valley Authority Project, Evaporation pans, Climatology, Data collections, Hydrologic data, Water balance.
Identifiers: Tennessee River Basin.

During the 35-year period 1935 through 1969, the Hydraulic Data Branch of the Tennessee Valley Authority observed daily evaporation and associated data at several land-pan stations in the Tennessee River Basin. Records of these observations are given in this report. Observations are made once daily between 7 and 8 a.m. during the months of April through October and between 4 and 5 p.m. during the period November through March. The afternoon observation time during the winter was set to permit natural melting of ice that covers the pan on cold mornings. The variation in mean annual evaporation from one end of the Valley to the other averages about 10 inches. The highest evaporation, 46 to 53 inches, occurs in the western part of the Valley and the lowest, 38 to 40 inches, in the North Carolina mountains. Evaporation in the east-central portion, as measured at the Norris and Jefferson City stations, is between these two limits. The principal difference in factors affecting evaporation is wind velocity. (Knapp-USGS)

Descriptors: *Evapotranspiration, *Distribution patterns, Topography, Winds, Meteorology, Climates, Precipitation (Atmospheric), Vegetation effects. Soil properties, Water storage, Soil water, Water balance, Advection, Consumptive use, Energy budget, Environmental effects.
Identifiers: Aerodynamic roughness.

Rate of evapotranspiration depends on the degree of confluence in time and space of three variables: water availability, energy supply, and surface ventilation. Within a topographically and vegetatively rough landscape, such as a typical watershed, each of these variables varies widely. Water availability is a function of precipitation characteristics, both temporal and spatial, as well as soil and vegetation characteristics as they affect storage. Local variations in energy supply are largely topography, vegetation and soils. Ventilation is a function of topographic position and surface roughness. Spatial variation in factors causative of evapotranspiration render its accurate evaluation impossible by present methods. Current reliance must be placed on approximations and relative magnitude evaluations. Several approaches to these are reviewed. (Knapp-USGS)

LOCAL VARIATIONS IN THE WATER BALANCE: GEOLOGIC FACTORS,
University of Western Ontario, London. Dept. of Geology.
Robert N. Farvolden.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 116-121, 1969. 6 p, 20 ref.

Descriptors: *Water balance, *Hydrogeology, *Geology, Surface-groundwater relationships, Aquifers, Groundwater basins, Groundwater movement, Discharge (Water), Evapotranspiration, Permeability, Transmissivity, Recharge, Water storage.
Identifiers: Inter-basin groundwater flow, North America.

The items in the water-balance equation that are most influenced by sub-surface geology are interbasin movement of groundwater and evapotranspiration. Interbasin flow of groundwater can be expected in any region underlain by highly permeable materials and it can be easily recognized where water table contours do not match the surface topography. Analytical techniques for the solution of these flow systems are now available. The pertinent parameters are the distribution and properties of the hydrostratigraphic units in the sub-surface, the geometry of the system, and the configuration of the water table. Subsurface geology has an important influence on evapotranspiration loss where it is the factor responsible for maintaining a high water table, particularly during long droughts, because evapotranspiration rate varies considerably according to the depth of the water table. Favorable conditions occur wherever shallow, river-connected aquifers support a heavy cover of phreatophytes and in areas of groundwater discharge. (Knapp-USGS)

WATER UPTAKE BY ORCHARDGRASS AND EVAPORATION FROM BARE SOIL IN THE PRESENCE OF SHALLOW WATER TABLES,
Department of Agriculture, Lethbridge (Alberta) Research Station.
J. C. van Schaik, and K. K. Krogman.
Canadian Journal of Soil Science, Vol 48, No 3, p 281-288, October 1968. 2 fig, 1 tab, 9 ref.

Descriptors: *Orchardgrass, *Moisture uptake, *Evapotranspiration, *Soil moisture, *Saline soils, Water table, Water level, Evaporation, Moisture content, Water loss, Grasses, Forage grasses, Semiarid climates, Transpiration, Fallowing, Soil surfaces.
Identifiers: *Alberta (Canada), *Salinization, *Bare fallow, Potential evapotranspiration.

Studies from June 16 to September 15, 1967 with 12 non-weighing lysimeters showed that orchardgrass (Dactylis glomerata) ET was 38.8, 37.2, and 34.9 cm with water tables at depths of 91, 122, and 152 cm, respectively. The measured ET due almost entirely to transpiration, represented 60 percent of the estimated potential ET. Surface salt concentration was not influenced by evaporation from bare soil in 1967. Barring fluctuation of the water table, salinization of cropped soil should principally occur outside the growing season. Since salinization would not take place without plant cover, use of bare fallow should retard salt movement and salinization of surface soil. (Carr-Arizona)

STREAMFLOW DISTRIBUTION PATTERNS IN MEXICO,
Secretariat of Hydraulic Research (Mexico); and Geological Survey, Tucson, Ariz.
Fernando del Rio, and Alfonso Wilson.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 62-73, 1969. 12 p, 8 fig, 2 tab, 9 ref.

Descriptors: *Water balance, *Regions, Hydrologic budget, Precipitation (Atmospheric), Rainfall, Rainfall-runoff relationships, Streamflow, Runoff, Evapotranspiration, Irrigation water.
Identifiers: *Mexico.

Half of Mexico lies in the temperate and half in the intertropical zone. Mountain ranges parallel the two coasts, and an intermontane plateau occupies almost the entire intervening area. Arid and semiarid regions comprise almost two-thirds of the country's 2-million odd square kilometers. True desert occupies only 4 percent of the area, while 7 percent is humid or very humid. Winter frontal precipitation is relatively unimportant. Summer precipitation occurs as short, intense storms. Even where annual precipitation appears abundant, it occurs mostly during the non-growing season. Annual precipitation ranges from almost zero to 5,000 mm and averages 704 mm. The total volume of precipitation is 1,408 billion cu m. The total runoff to the sea and to international streams is 349.5 cu m. Surface runoff amounts to only 25% of precipitation and loss to evapotranspiration is 75% of precipitation. The net volume of water used in irrigation is about 1 1/2% of the precipitation and about 6% of the runoff. (Knapp-USGS)

HYDROMETRIC SURVEYS,
Shawinigan Engineering Co. Ltd., Montreal (Quebec).
S. I. Solomon.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 125-136, 1969. 12 p, 1 fig, 3 tab, 7 ref.

Descriptors: *Hydrologic data, *Hydrography, *Data collections, *Surveys, *Networks, Regions, Gaging stations, Water balance, Meteorological data, Distribution patterns, Surface waters, Groundwater, Soil water.
Identifiers: Hydrometric surveys, North America.

From about 12,000 gaging stations which are or have been in operation in North America, it is now possible to draw at least an approximate picture of the average water availability and to roughly estimate other hydrologic characteristics. However, because of the extreme variation in network density and the vastness and variety of the terrain, there are areas with inadequate hydrometric coverage. A similar situation exists for the meteorologic networks which to a large extent have been developed independently of the hydrometric networks, but followed a similar pattern. Further expansion of the present network therefore appears imperative in some areas, while reduction of the density may be possible in other areas. The use of computers, satellites, and other related technological development will facilitate the collection, processing, and retrieving of hydrologic information in a more comprehensive way than in the past. AREAL EXTENSION OF STREAMFLOW INFORMATION BY MULTIPLE-REGRESSION TECHNIQUES,
Geological Survey, Washington, D.C. Surface Water Branch.
Manuel A. Benson, and Rolland W. Carter.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 137-143, 1969. 7 p, 2 fig, 1 tab.

Descriptors: *Streamflow forecasting, *Hydrologic data, *Data processing, *Regression analysis, Statistical methods, Gaging stations, Networks, Surveys, Streamflow, Discharge (Water), Planning, Water resources development, Data collections.
Identifiers: Multiple regression analysis.

Definition of the natural streamflow in all streams, gaged or ungaged, is one of the principal objectives of a streamflow information program. Multiple regression analyses are used to provide general definition of natural streamflow. The streamflow characteristics that may be generalized are used in planning and design; they are indices of high, low and medium flows, and also of the distribution of flows in time. Numerous topographic and climatic indices are used to describe the watershed and its environment above the site of each flow record. Multiple regression analyses then relate each flow characteristic to the effective basin characteristics. The result is in the form of generalized equations for estimating flow characteristics at any site, gaged or ungaged. The analyses also provide measures of the accuracy of each relation. Examples are given of results of such studies. (Knapp-USGS)

Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Sub-Committee on Hydrology, p 59-80, Vol 1, 1969. 22 p, 1 tab, 8 ref.

Descriptors: *Instrumentation, *Stream gages, *Surface waters, Discharge measurement, Flowmeters, Tracking techniques, Remote sensing, Telemetry, Gaging stations, Streamflow, Velocity, Water levels, Aerial photography, Data processing.
Identifiers: Surface water instrumentation, Canada.

Methods for the measuring, recording and calculating of water levels, current velocities, water depths, and flow volumes are described with special emphasis on the advantages and disadvantages inherent in each of the measurement techniques. Techniques discussed include bubbler systems, closed pressure systems, and float systems for water level recording; current meter measurements and dilution methods for flow measurements; and sounding equipment, weirs, flumes, spillways, and turbines. Some emphasis is placed on the effects of Canada's variable climate on instrumentation and measurement techniques. The use of indirect methods such as maximum gages and other types of partial record stations are examined. Recent and possible future developments such as leasing edge current meters, velocity measurements by aircraft (Russia) and the use of digital recorders and automatic plotters or chart readers as part of the automation of data processing are surveyed. Solutions for winter instrumentation and observation techniques are discussed. (Knapp-USGS)

FLOOD ROUTING USING A CONVECTIVE DIFFUSION MODEL,
Birmingham Univ. (England). Dept. of Civil Engineering.
I. E. Thomas, and P. R. Wormleaton.
Civil Engineering and Public Works Review, Vol 65, No 764, March 1970, p 257-259. 6 fig, 5 ref.

Descriptors: *Flood routing, *Streamflow, Hydrology, Hydraulics, *River systems, Design.
Identifiers: *Convective diffusion model, River Dee, North Wales.

An alternative routing procedure resulting from a recognition of the similarity of the flood wave profile to the transient concentration distribution curve for a mass of material diffusing in a stream flow was discussed. In its one dimensional form the convective diffusion model of the wave phenomenon was described. The usual methods for routing floods through open channels are the 'hydraulic' and 'hydrological' approach which was mentioned. The general research programme of the Water Resources Board on the regulation of the River Dee in North Wales provided an opportunity for testing the application of the diffusion routing method to a real river system. The general river configuration between Glyndyfrowy and Erbistock together with the positions of tributaries, gauging stations and sub-catchment boundaries were shown. Details of representative floods analyzed were given. Results of considering a flood sequence as a whole and routing the inflows using values of dispersion obtained by a simple averaging of the values for its component peaks were shown. (Kriss-Cornell)

A NOTE ON THE CELERITY OF WIND WAVES ON A WATER CURRENT,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Erich Plate, and Michael Trawle.
Journal of Geophysical Research, Vol 75, No 18, p 3537-3544, June 20, 1970. 5 fig, 3 tab, 11 ref. Grant GK-2142 (NSF) and Grant AT911-L)-1813 AEC.

Descriptors: *Waves (Water), *Winds, *Currents (Water), *Hydraulic models, Laboratory tests, Model studies, Wind velocity, Flumes.
Identifiers: Wind tunnel tests.

Measurements were made of water surface velocities and phase speeds of the dominant waves in fields of gravity waves at the interface between parallel streams of air and water moving either in the same or in opposite directions. Velocities in the air flow were correlated with those in the water current. The phase velocity depends on the water surface velocity, and it is concluded that the Airy wave theory gives values which are too low. An attempt is made to explain the results in terms of Biesel's model for wave motion on moving water with a linear velocity gradient. (Knapp-USGS)

Journal of Geophysical Research, Vol 75, No 18, p 3545-3552, June 20, 1970. 5 fig, 1 tab, 23 ref. Contract No AT (30-1)2663 AEC.

Descriptors: *Ocean circulation, *Water chemistry, *Tracking techniques, Stable isotopes, Oceans, Radioisotopes, Water circulation, Ocean currents, Currents (Water), Oceanography, Water temperature, Calcium carbonate, Chemical precipitation, Sedimentation rates.
Identifiers: Ocean water interchange.

A three-box model is used to evaluate the rate of exchange of water between the three major water types in the ocean: warm surface water, North Atlantic deep water, and Pacific and Indian deep water. The eight unknown fluxes (six for water and two for particles) are determined from material balance considerations for H2O, C-14, and total CO2 and from the requirement that the relationships between 0-18 and salinity observed in the ocean are not to be violated. The validity of the model is checked by comparing the predicted and observed rates of CaCO3 accumulation in deep-sea sediments. (Knapp-USGS)

WATER INVENTORY STUDIES IN THE UNITED STATES AND THE I.H.D. PROGRAM,
National Committee for the International Hydrological Decade, Washington, D.C.
L. A. Heindl.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 299-302, 1969.

Descriptors: *Surveys, *Water resources, *United States, *International Hydrological Decade, Groundwater, Surface waters, Water resources development, Water supply, Water balance, Hydrology, Hydrography, Mapping, Data collections, Hydrologic data.
Identifiers: *National Water Atlas (US).

Water inventories in the United States are made largely on the basis of data compiled from federal networks of climatological, surface-water, groundwater, sediment-discharge, and chemical quality stations. These data are supplemented by data from state and special-purpose networks, including those of experimental and representative basins, snow courses, glacial and lysimeter stations, and lake-level gages. Water inventory studies usually are in the forms of water budgets or water balances. A proposal to present the principal elements of the hydrological regimen on uniform time and space scales for the 17 major basins of the conterminous United States and for all of the United States and its territories--a national water atlas--is now being reviewed. Large masses of data have been collected in the United States, but they have never been compiled in a unified way. The national water atlas is a proposal to compile these data so as to make them available for scientific analysis, education, planning of future studies, and the management of water resources as an integral part of our natural environment. CANADIAN RESEARCH,
National Committee for the International Hydrological Decade, Ottawa (Ontario).
Ira C. Brown
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 303-307, 1969.

Descriptors: *Surveys, *Water resources, *International Hydrological Decade, Groundwater, Surface waters, Water resources development, Water supply, Water balance, Hydrology, Hydrography, Mapping, Data collections, Hydrologic data, Glaciers.
Identifiers: *Canada, *National Hydrological Atlas (Canada).

Canada's International Hydrological Decade program of 211 projects includes most of the research effort relating to water balance. Nearly all projects are cooperative with from 3 to 14 participating agencies. In 1968 the program represented a total investment of $4.75 million with universites coordinating 61 projects, provincial agencies 65 and federal agencies 85. The organization to promote and coordinate this program is described, together with the method of funding and the programs for exchange of information and education. Inventories of glaciers and lakes are well under way and the Hydrological Atlas of Canada is in preparation. International cooperative efforts involve coordination with the United States of Decade stations along our border, inclusion of 7 glacier basins in worldwide chains, and the Canadian/United States International Field Year on the Great Lakes program, an intensive 18-month study of Lake Ontario. FLOOD OF APRIL 1968 AT MANY, LOUISIANA,
Geological Survey, Washington, D.C.
Alfred S. Lowe.
For sale by U S Geological Survey, Wash, D C 20402 - Price $0.50. U S Geological Survey Hydrologic Investigations Atlas HA-374, 1 sheet, 1970. Text, 7 fig, 1 map, 3 tab, 4 ref.

Descriptors: *Floods, *Louisiana, *Cloudbursts, Profiles, Maps, Mapping, Frequency analysis, Rainfall-runoff relationships, Stage-discharge relations, Discharge (Water), Storm runoff, Historic flood, Peak discharge.
Identifiers: Many (La).

On April 8-9, 1968, an almost stationary line of thunderstorms from 50 to 75 miles wide produced torrential rains in the northern half of Louisiana. The greatest rainfall of the storm, 12.48 inches, fell in the Many area and caused flooding in and around Many. The approximate area of inundation caused by the four streams that surround Many--Harpoon Bayou, Phillips Creek, Blackwell Creek, and San Jose Creek--is shown on a photomosaic map. Most of the flooded area was under water for less than 24 hours. This report presents hydrologic data that can be used to evaluate the extent and frequency of flooding that affect the economic development of flood plains in the Many area. It will aid individuals, government agencies, and others responsible for solving existing flood problems. The report will also be useful for preparing building and zoning regulations, locating waste disposal facilities, and developing recreational areas. (Knapp-USGS)

Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 144-146, 1969. 3 p

Descriptors: *Surveys, *Hydrogeology, *Limestones, *Carbonate rocks, *Alabama, Karst, Aquifers, Groundwater, Groundwater movement, Hydrologic budget, Recharge, Discharge (Water), Water supply, Hydrologic data, Data collection, Water levels, Water yield.
Identifiers: Limestone aquifers.

In research on the hydrology of the limestone terrane in north Alabama geological, geophysical, and geochemical techniques are used. In addition to more conventional methods, newer methods such as aerial photography are used to help define the lithologic and structural character of the rocks and the hydrologic system. Comprehensive evaluation enhances the probability of determining favorable areas for development of groundwater. Wells drilled in areas deemed favorable on the basis of techniques applied in this research are significantly more productive than wells drilled in other areas. (Knapp-USGS)

Descriptors: *Instrumentation, *Groundwater, *Hydrogeology, *Groundwater movement, *Aquifers, Sampling, Telemetry, Observation wells, Geophysics, Borehole geophysics, Radioactivity techniques, Tracers, Tracking techniques, Piezometers, Piezometry, Seismic studies, Electrical studies, Data processing, Data storage and retrieval, Data transmission.
Identifiers: Groundwater instrumentation, Canada.

Rapid changes in the sophistication of groundwater measuring techniques have taken place during the past five years. A brief review presents the standard measuring techniques in groundwater hydrology followed by an extensive survey of more modern techniques. Groundwater flow measurement may be made by observation wells. The equipment and techniques for such measurement include installation of piezometers and the use of pressure transducers. Observation wells can be used as seismometers to yield aquifer parameters. Geophysical techniques are applied to groundwater studies. They include electrical and radioactive methods of borehole logging, along with surface methods of geophysical surveying for aquifers, including seismic, gravity, resistivity, and electromagnetic methods. Equipment digitization methods for data storage and transmission include telemetering and remote collection of data and use of computers i

data processing. Techniques and equipment for sampling the quality of groundwaters and determination of fluid potentials include packers and sampling devices. (Knapp-USGS)

REMOTE SENSING GEOPHYSICAL APPLICATIONS TO HYDROLOGY,
Geological Survey of Canada, Electrical Methods Section.
L. S. Collett.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 237-260, Vol 1, 1969. 24 p, 12 fig, 1 tab, 18 ref.

Descriptors: *Remote sensing, *Hydrogeology, *Aquifers, *Groundwater, Saline water intrusion, Geophysics, Electrical studies, Magnetic studies, Subsurface mapping.
Identifiers: Canada, Airborne geophysical surveys.

The presence of groundwater is related to geology and geological structures, which can nearly always be characterized locally by the electrical parameters of conductivity and dielectric constant. Conductivity exhibits by far the largest variations of its magnitude for various rock materials. Structures which contain fresh water will always exhibit a fairly low conductivity. Through the mapping of these properties by remote sensing geophysical techniques can be applied to hydrology. Where the host structures are shallow, airborne VLF (Very Low Frequency) systems look promising for detecting variations in ground conductivity. For the deeper case where faulting and shear zones contain water in the fractures, audio frequency magnetics is presently being applied. A conventional airborne EM system is used for resistivity mapping of geological structure and salt-water intrusions. (Knapp-USGS)

GROUNDWATER FLOW SYSTEMS AND ACCUMULATION OF EVAPORITE MINERALS,
Idaho Univ., Moscow. Coll. of Mines.
Roy E. Williams.
American Association of Petroleum Geologists Bulletin, Vol 54, No 7, p 1290-1295, July 1970. 2 fig, 30 ref.

Descriptors: *Reviews, *Bibliographies, *Groundwater movement, *Geochemistry, *Chemical precipitation, Water quality, Groundwater basins, Water circulation, Permeability, Sedimentary rocks, Flow, Evaporation, Convection, Porous media, Discharge (Water), Recharge, Solutes, Aqueous solutions.
Identifiers: Evaporite deposits.

The literature on evaporite mineral deposits suggests a functional relation between the origin of these deposits and groundwater flow systems. Comparison of reported spacial variations of groundwater quality with pertinent solutions to flow equations under specified boundary conditions reveals that quality of groundwater is a function of flow-path length, flow-path route and flow velocity. Selected references provide evidence that sites of accumulation of nonmarine evaporite minerals are discharge zones for poor-quality water from regional or intermediate groundwater flow systems. Reported isotope ratios in oil field brines and standard mean ocean water indicate that water in some deep brines is of meteoric origin; therefore, such brines must be part of a groundwater flow system. Similarly, fluid potential values in the saline parts of certain groundwater flow systems along the Atlantic Coast of the United States reveal that saline groundwater in such systems discharges toward the ocean floor. Therefore, groundwater flow systems act as transport agents for dissolved solids which under appropriate geomorphic and climatic conditions, are contributed to marine evaporite deposits. (Knapp-USGS)

2G. Water in Soils

FACTORS AFFECTING PERCOLATION IN A FOREST SOIL,
Washington Univ., Seattle. Coll. of Forest Resources.
Dale W. Cole, and Peter S. Machno.
Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association publication, Urbana, Illinois, p 101-109, 1969. 9 p, 2 tab, 18 ref.

Descriptors: *Water balance, *Infiltration, *Soil water movement, *Forests, Model studies, Mathematical models, Hydrograph analysis, Base flow, Consumptive use, Evapotranspiration, Water yield improvement, Forest management, Water storage, Soil water.
Identifiers: Soil water storage.

Specific factors affecting the water balance in a forest ecosystem are examined both theoretically and through actual field measurements. The variety of techniques that have been devised to evaluate soil water flow and retention are evaluated in regards to sensitivity and applicability. These techniques include theoretical models utilizing mathematical approaches and field techniques where measurements of soil moisture amounts and rates of flow are directly assessed. Specific examples illustrating the effects of horizontal layering, prior soil moisture conditions and pore distribution on soil water flow are cited. Sources of variability in the hydrograph characteristics of flow are examined using data from field measurements. For example, changes in flow rates as a function of depth and water use by plants are presented. Data illustrating changes in flow characteristics and total water yield following the removal of the forest canopy are also discussed. (Knapp-USGS)

SOIL MOISTURE,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
G. C. Topp.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969, held Oct 8-9; 1969, National Research Council of Canada, Subcommittee on Hydrology, p 21-36, Vol 1, 1969. 16 p, 47 ref.

Descriptors: *Instrumentation, *Soil water movement, Mass transfer, Nuclear moisture meters, Soil water, Soil moisture meters, Nuclear magnetic resonance, Flowmeters, Unsaturated flow.
Identifiers: Soil water flowmeters, Canada.

Recent advances or other techniques in soil-water measurement are discussed. Water content is a function of the pressure. A transfer of water depends on the pressure gradients in the soil. Tensiometric, vapor pressure and other methods of measuring water pressure or potential are described and evaluated with regard to laboratory and field studies. Water content determinations are improved by recent modifications in techniques involving neutron moderation and gamma ray attenuation. For small samples, nuclear magnetic resonance gives a reliable measure of water content. Two new methods make use of the water content dependent propagation of ultrasonic waves and the water content dependent 'fringe' capacitance. Two flowmeters for in situ flow rates are described and suggested for use in hydraulic conductivity determinations. (Knapp-USGS)

INVERSE FORMULATION AND FINITE DIFFERENCE SOLUTION TO PARTIALLY SATURATED SEEPAGE FROM CANALS,
Utah State Univ., Logan; and Computer Sciences Corp., Richland, Wash.
Roland W. Jeppson, and R. William Nelson.
Soil Science Society of America Proceedings, Vol 34, No 1, p 9-14, Jan-Feb 1970. 6 p, 2 fig, 12 ref.

Descriptors: *Unsaturated flow, *Seepage, *Canal seepage, Formulation, Steady flow, *Finite differences, Theory, Porous media, *Flow nets, Soil water movement, Equations, Mathematical analysis, Hydraulic conductivity.
Identifiers: Finite difference method, Computer applications, Porous media flow.

The mathematical model describing Darcian flow of water through soils approximates actual occurrences more closely when regions of the flow are permitted to be partially saturated. A generally accepted relationship between effective permeability and capillary pressure is utilized to formulate and solve by inverse methods with finite differences the steady-state flow system of water through soils. The inverse formulation considers the cartesian coordinates x and y as the dependent variables, and the potential function, phi, and the 2-dimensional stream function, psi, as the independent variables (the problem is solved for x and y in the phi-psi plane). The form of the solutions obtained from the inverse procedure is ideally adapted for plotting flow nets and obtaining other quantities such as hydraulic gradients, pressures, velocities, and relationships between capillary tension and moisture content anywhere within the flow field. A flow net for partially saturated seepage from a canal was obtained using the method and an electronic computer for the computations. (USBR)

INFILTRATION RATES IN SOILS OF THE EDMONTON AREA AND RAINFALL INTENSITIES,
Alberta Univ., Edmonton. Dept. of Soil Science.
T. R. Verma, and J. A. Toogood.
Canadian Journal of Soil Science, Vol 49, No 1, p 103-109, February 1969. 3 fig, 3 tab, 9 ref.

Descriptors: *Infiltration, *Soil types, *Rainfall intensity, *Vegetation effects, *Soil management, Runoff, Runoff forecasting, Impervious soils, Rainfall, Air-earth interfaces, Precipitation (Atmospheric), Erosion, Erosion control, Soil water, Groundwater, Semiarid climates.
Identifiers: *Infiltration rates, *Alberta (Canada), Edmonton sheet.

The major soil types in the vicinity of Edmonton, Alberta (Canada) were studied in order to determine their infiltration rates. Soils ranged from undisturbed to recently cultivated, from impervious to open and well-drained. Types of ground cover included fallow, grass, mixed forage, and grain. When rainfall intensity in the area was related to infiltration rates, it appeared that there was little likelihood of runoff from soils of the Edmonton sheet. On the Solonetzic soils, however, runoff might occur, although even this tendency would be counteracted by high initial infiltration rates. The total picture indicated a very slight runoff hazard during summer storms near Edmonton. Good soil management should properly protect local soils from water erosion during summer storms, although special problems might arise during spring runoff when the ground is frozen. PHOSPHATES IN PEORIA LAKE: A QUANTITATIVE AND QUALITATIVE EVALUATION OF A NUTRIENT IN NATURAL WATERS,
Illinois State Water Survey, Peoria. Water Quality Section.
William T. Sullivan, and David L. Hullinger.
Transactions of the Illinois State Academy of Science, Vol 62, No 2, p 198-217, 1969. 5 fig, 14 tab, 33 ref.

Descriptors: *Phosphates, *Illinois, *Nutrients, Industrial wastes, Municipa' wastes, Agriculture, Runoff, Flow, Seasonal, Chemical analysis, Biological properties, Sampling, Load distribution.
Identifiers: *Peoria Lake (Ill), Illinois River, Orthophosphate, Polyphosphate, Organic phosphate.

Peoria Lake is situated midway between Chicago and the Mississippi River on the Illinois Waterway; its waters are substantially augmented by a variety of soluble and suspended materials from municipal and industrial wastes and from agricultural watersheds. A study of the chemical and biological characteristics of Peoria Lake was conducted during March-October 1967. Samples were collected on 25 dates from 9 stations at a standard 3-feet depth. Laboratory analysis of soluble and particulate fractions of ortho-, poly-, and organic phosphate forms has allowed evaluation of the various phosphates found in these natural waters. The phosphorus budget for the study period showed the mean daily phosphate load for all fractions and forms entering the lake to be 77,200 pounds; total phosphate leaving the lake was 63,400 pounds. The net phosphate apparently retained in Peoria Lake was calculated to be a mean of 13,800 pounds/day, or 17.9% of the influx. Possible mechanisms affecting this retention and distribution of the various fractions and forms are discussed. Although nutrient conditions appeared sufficient to support plankton populations, they were non-existent. (Jones-Wisconsin)

RELATIONSHIPS BETWEEN BACTERIA AND PHYTOPLANKTON,
Byelorussian State Univ., Minsk (USSR). Dept. of Invertebrate Zoology.
Yu S Potaenko, and T M Mikheeva.
Trans. from Mikrobiologiya, Vol 38, No 4, p 722-727. July-Aug 1969. Microbiology, Vol 38, No 4, p 603-607, 1969. 3 fig, 37 ref.

Descriptors: *Bacteria, *Phytoplankton, *Lakes, Algae, Microorganisms, Biomass, Diatoms, Cyanophyta, Iron, Algicides, Zooplankton, Fish.
Identifiers: Byelorussia (USSR), Polychloropinene.

Several factors may be operational simultaneously in the characteristics of the relationship between bacteria and phytoplankton. Study of bacterioplankton and phytoplankton of eight Byelorussian lakes in different years showed there were extremely diverse relationships between algae and other microorganisma: growth of algae and bacteria proceeded in parallel, maximum algal development corresponded to minimum bacterial population and vice versa, or the growth of these groups of organisms was independent. No definite relationship was observed between bacterial growth and the presence of a given toxonomic algal group. The usual cycles for individual species and algal groups were reestablished when the disrupted equilibrium among different elements of the food chains was restored a year after the fish kill. From a study of variation in bacterioplankton grown in the Narochanskii Lakes and from data in the literature of the seasonal dynamics of bacterial population in a number of other lakes, it can be concluded that the bacterioplankton distribution and population characteristic of other eutrophic lakes in the Soviet Union is restored within 1.5 years after treatment with PCP compound. (Jones-Wisconsin)

NEAR-SHORE WATER CHEMISTRY OF EASTERN LAKE ERIE,
State Univ. Coll., Fredonia, N.Y.
George W. Schmidt.
Lake Erie Environmental Studies, Technical Data Report No 2. 34 p, 13 fig, 2 tab, 8 ref.

Descriptors: *Lake Erie, *Water chemistry, Physical properties, Temperature, Seasonal, Dissolved oxygen, Biochemical oxygen demand, Hydrogen ion concentration, Carbon dioxide, Runoff, Hardness (Water), Alkalinity, Detergents, Lignins, Winds, Tributaries, Waves (Water), Oxidation-reduction potential, Iron, Ammonia, Silica, Suspended load, Phosphates, Coliforms, Bicarbonates, Chlorides, Sulfates, Nitrates, Copper, Trace elements, Precipitation (Atmospheric), Magnesium, Turbidity.
Identifiers: *Near-shore, *Eastern Lake Erie, Tannins, Chromates, Conductance.

A base line of physical and chemical parameters for near-shore waters of the eastern basin of Lake Erie has been established for an 18 month period from mid-July 1968 through mid-December 1969. Variations due to water temperature changes were detectable in dissolved oxygen concentration, biochemical oxygen demand, and hydrogen ion concentration. Dissolved carbon dioxide concentration was not shown to be water temperature dependent by the method employed. Hydrogen ion concentration data do indicate that solubility of carbon dioxide was probably dependent on water temperature. Effluents of individual streams were detectable in the water chemistry of the lake, whicl varied widely in chemical constituents on bot seasonal and random basis. Mixing of near-shor waters was generally dependent upon wind velocit and wave conditions. Calm periods, in which littl mixing occurred, appeared to have caused a stand ing water mass along the near-shore area. Thi might have influenced decomposing organic matte to decrease the oxidation-reduction potential lo cally. Continuous recording devices to monito water temperature, dissolved oxygen concentra tion, hydrogen ion concentration, specific con ductance, oxidation-reduction potential, wate level, and local stream discharge would be of tre mendous value in interpreting short term change in all parameters. 2I. Water in Plants

CHEMICAL PROPERTIES, PHYSICAL PRO PERTIES AND PLANT GROWTH IN TWENT ARTIFICIAL WILDLIFE MARSHES,
Cornell Univ., Ithaca, N. Y. Dept. of Agronomy.
D. J. Lathwell, H. F. Mulligan, and D. R. Bouldin.
New York Fish and Game Journal, Vol 16, No 2, 158-183, July 1969. 26 p, 2 fig, 17 tab, 8 ref.

Descriptors: *Water chemistry, *Marshes, *Mars management, *Habitat improvement, *Soil-water plant relationships, Flooding, Wildlife manage ment, Soil chemistry, Marsh plants, Swamps, Wate balance, Energy budget, Nutrients.
Identifiers: Artificial Wildlife marshes.

Measurements of physical and chemical charac teristics of water and bottom soil were mad throughout each season from 1960 to 1967 on 2 artificial marshes to determine factors that in fluenced the growth of aquatic plants important a food sources for wildlife. Water depth was varie from 1 to 3 feet, and throughout the study greate plant growth was observed in the shallowe marshes. Additions of organic matter to the bottor soils resulted in increased plant growth early in th study, but in later years they had little effect. Th additions of limestone to this neutral to calcareou soil material had no effect on plant growth. Of th factors measured, to extractable iron in the sed ment increased at an increasing rate while extracta ble manganese increased only slightly over th course of the study. Total alkalinity of the wate decreased consistently throughout the first si years, but it increased during the last two years c the study. (Knapp-USGS)

HOW CROPS ABSORB WATER,
Duke Univ., Durham, N. C. Dept. of Botany.
Paul J. Kramer.
Connecticut Agricultural Station, New Haven, Bu letin 708, p 42-62, July 1969. 9 fig, 3 tab, 55 ref.

Descriptors: *Soil-water-plant relationships, *Roo systems, *Flow resistance, *Chemical potentia *Absorption, *Soil water movement, Sa tolerance, Aeration, Soil temperature, Transpira tion, Hydraulic conductivity, Xylem, Dehydratior Arid lands, Breeding, Turgidity, Leaves, Stomata Soil texture, Osmotic pressure, Dessicants, Cuticle
Identifiers: *Water feedback loops, *Root surfac area, *Salinity tolerance, *Water potentia *Dehydration tolerance, Active transport, Passiv transport, Suberized roots, Root hairs, Root ho mones, Guttation.

Available data indicates that crop plants use 250-500 units of water per unit of dry matter produced. Continued growth therefore depends on a balance between absorption gains and transpiration losses. Plant water absorption is directly related to water potential differences between soil and root surface or between root surface and root xylem. The physical factors affecting root water absorption are discussed and it is argued that not only are water and salts absorbed by root hairs but also by suberized roots. Roots also produce chemical substances which indirectly affect plant water balance. Soil water availability and absorption are functions of soil water potential, soil hydraulic conductivity, soil temperature, soil aeration, soil salinity and root water potential. The importance of each limiting factor is discussed particularly for semi-arid and arid zone soils. The major factors in any program of breeding for improved plant water balance mechanisms would be: (1) Improved root systems (2) Transpiration reduction (3) Increased dehydration tolerance (4) Increased salt tolerance. ENVIRONMENTAL FACTORS AFFECTING RESISTANCE TO DESICCATION IN THE DIATOM STAURONEIS ANCEPS,
Arizona Univ., Tuscon. Dept. of Biological Sciences.
H. P. Hostetter, and R. W. Hoshaw.
American Journal of Botany, Vol 57, No 5, p 512-518, May-June 1970. 6 fig, 4 tab, 14 ref.

Descriptors: *Diatoms, *Dehydration, *Drought resistance, *Environmental effects, *Moisture stress, Drying, Drought, Algae, Aquatic algae, Arid lands, Deserts, Arizona, Particle size, Temperature, Cultures, Cytological studies, Plant physiology.
Identifiers: *Survival, *Metabolites.

Among the environmental parameters affecting the ability of Stauroneis anceps Ehr. to withstand conditions of severe water stress are culture age, type of medium, temperature, vapor pressure, and particle size of substrate. Cells grown in soil-water survived drying to equilibrium with atmospheric humidity better than cells grown in defined medium. Similarly, cells grown from older cultures survived better than those from young ones, perhaps due to accumulation by older cultures of secreted metabolites in the medium. If drying occurs in artificial substrata there is survival when particulate matter is 100 microns in diameter or larger, but no survival at less than 50 microns. Slow drying apparently enhances survival and desiccated cells withstand temperature extremes better than vegetative cells in an aqueous environment. Normal cultures could not survive 1 hr at 60 C, but dry cells survived more than 9 days at that temperature and longer than 8 hr at 80 C. Vapor pressure deficits of 11.9 mm Hg or higher facilitated cell survival under storage. Since algal cells are able to withstand long periods of dehydration and this desiccated state enables them to survive extremely high temperatures, it would appear that survival of algae in ephemeral desert pools often involves dehydrated cells. (Carr - Arizona)

GROWTH, YIELD, AND YIELD COMPONENTS OF SAFFLOWER AS AFFECTED BY IRRIGATION REGIMES,
Arizona Agricultural Experiment Station, Tucson.
Leonard J. Erie, and Orrin F. French.
Agronomy Journal, Vol 61, No 1, p 111-113, January-February 1969. 1 fig, 5 tab, 1 ref.

Descriptors: *Arizona, *Oilseed crops, *Crop production, *Plant growth, *Water requirements, Soil water, Irrigation, Irrigation effects, Irrigation practices, Crop response, Arid lands, Soil moisture, Moisture availability, Moisture stress, Consumptive use, Soil-water-plant relationships, Flowering, Seeds.
Identifiers: *Safflower, *Irrigated agriculture, *Yield components.

Safflower (Carthamus tinctorius L.) was grown in Arizona in order to study the effect of irrigation regime on plant growth and seed yield. Fall-planted Frio safflower was subjected to 8 different irrigation treatments. Four treatments were irrigated when 60% of the available moisture in the upper 120 cm of soil was depleted; four other treatments were irrigated at the 72% level. Five irrigation cutoff dates were used, varying from 3 weeks before first flowering until harvest. Individual plots received from 3 to 9 irrigations, depending on the combination of soil moisture depletion treatments and varying cutoff dates. The study found that with each increment of irrigation water there was a tendency for seed yield, weight per seed, seeds per head, and oil content to increase, while percentage of hollow seed decreased. It would appear that 7 irrigations given until the last flowers opened was the preferable irrigation regime. The treatment yielded 3,961 kg/ha of seed and consumed 107 cm of water. This resulted in the greatest seed yield per centimeter of water used by the plant. When last irrigation occurred at the time of first flowering, yield declined 800 kg/ha. Last irrigation 10 days prior to flowering caused a reduction in yield of almost one-half. (Carr - Arizona)

BRYOZOAN CARBONATE SAND CONTINUOUS ALONG SOUTHERN AUSTRALIA,
Sydney Univ. (Australia). Dept. of Geology and Geophysics; South Carolina Univ., Columbia. Dept. of Geology; and New South Wales Univ., Kensington (Australia). Dept. of Zoology.
Robin E. Wass, John R. Conolly, and R. J. Macintyre.
Marine Geology, Vol 9, No 1, p 63-73, June 1970. 11 p, 6 fig, 3 tab, 13 ref.

Descriptors: *Sands, *Calcium carbonate, *Bottom sediments, *Benthic fauna, Marine animals, Sands, Sedimentary structures, Sampling, Data collections.
Identifiers: *Australia, Bryozoa.

Modern and reworked Pleistocene and Tertiary bryozoan calcareous sand extends over the 20-150 miles wide and 2,500 miles long continental shelf of southern Australia from north of Perth on the west coast, eastwards to east Bass Strait. Bottom photography and dredge samples reveal that living Bryozoa thrive most abundantly at depths of 50-120 fathoms and that catenicelliform Zoaria occur in fine grained sand in quite water whereas lunulitiform Zoaria live in loose, moving, rippled sands; reteporiform Zoaria are common in water with mild current action. Adeoniform and vinculariiform Zoaria commonly occur at depths greater than 100 fathoms. (Knapp-USGS)

SEDIMENTS OFF THE WEST COAST OF BARBADOS: DIVERSITY OF ORIGINS,
McGill Univ., Montreal (Quebec).
Ian G Macintyre.
Marine Geology, Vol 9, No 1, p 5-23, June 1970. 19 p, 8 fig, 34 ref.

Descriptors: *Bottom sediments, *Oceans, *Continental shelf, Marine geology, Carbonates, Sands, Carbonate rocks, Sedimentation, Provenance, Deposition (Sediments), Diagenesis.
Identifiers: *Barbados.

A multiplicity of sources is evident in marine sediments off the west coast of Barbados, W.I., where sediments and morphology of the sea floor studied to a depth of 1,300 ft. A high percentage of the carbonate material was not formed in the present environment of deposition. Shoreward of a depth of 70 ft., sediments of the insular shelf facies are composed mainly of modern skeletal material along with detrital deposits. Between depths of 70 and 400 ft. (an area that includes two submerged reefs) sediments of the upper slope facies contain a complicated mixture of relict residual, modern organic and volcanic material. Seaward of a depth of about 400 ft. in the slope facies, sediments are composed mainly of residual material derived from submarine outcropping beds, but include some volcanic and modern organic material. The pyroclastic material in the marine sediments was derived from La Soufriere on the island of St. Vincent, which is 100 miles west and leeward of Barbados. Then noncarbonate fraction of the insular shelf sands is predominantly detrital quartz. Grey discoloration in carbonate grains, which is caused primarily by the presence of diagenetic pyrite, occurs in those grains that were transported into stagnant, ponded river mouths that are common along the west coast of Barbados. (Knapp-USGS)

INSTRUMENTATION AND TECHNIQUES IN SEDIMENT SURVEYING,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
W. Stichling.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 81-139, Vol 1, 1969. 59 p, 42 fig, 26 ref.

Descriptors: *Instrumentation, *Sediment load, *Sampling, Data processing, On-site tests, Laboratory tests, Sediment discharge, Suspended load, Bed load, Surveys, Data collections.
Identifiers: Sediment instrumentation, Canada.

Satisfactory instruments and techniques for measuring suspended sediment discharge have been developed over the last 25 years and the use of radioisotope and other monitoring instruments promises to increase the effectiveness of existing methods. In the case of bed-load discharge measurement, however, equipment and techniques are still far from satisfactory. There is hope that research into the use of tracers or other techniques may lead to a breakthrough. The grain-size distribution in the bed material must be known and in-

formation on other hydraulic parameters must be available. Satisfactory sampling of bed material is possible using existing equipment. The field and laboratory equipment and techniques used in Canada for measuring suspended sediment discharge and bed-load discharge and for sampling bed material are described. (Knapp-USGS)

GRAIN ORIENTATION IN DETERMINATION OF PALEOCCURRENTS AND SANDSTONE TRENDS,
Oklahoma State Univ., Stillwater. Dept. of Geology.
John W. Shelton, and Douglas E. Mack.
American Association of Petroleum Geologists Bulletin, Vol 54, No 7, p 1108-1119, July 1970. 10 fig, 1 tab, 24 ref.

Descriptors: *Sedimentary rocks, *Currents (Water), *Deposition (Sediments), *Sedimentary structures, Instrumentation, Laboratory tests, Borehole geophysics, Sedimentology, Sandstones, Sands.
Identifiers: Paleoccurrent analysis, Particle orientation.

Measurement of grain orientation in relatively large samples by means of a dielectric anisotropy device is both rapid and reliable. It corresponds accurately to other paleoccurrent indicators, such as parting lineation, rib-and-furrow structures, sole marks, and cross-bedding. Because grains are imbricated upcurrent, current direction can be inferred accurately from analysis of grain orientation in the vertical plane paralleling the horizontal grain fabric. Dielectric anisotropy measurements of partly impregnated Cimarron River sand depict very well recent local current directions of the river. Because the horizontal component of grain orientation in horizontally bedded or cross-bedded sands statistically corresponds to current trend, remote measurement of grain orientation in a borehole could make possible the determination of sandstone trend from a single well. Adaptation of the dipmeter log offers an available tool for such a technique. (Knapp-USGS)

WATERS FOR WATERFLOODING SAN JOAQUIN VALLEY, CALIF, PETROLEUM RESERVOIRS,
Bureau of Mines, San Francisco, Calif. Petroleum Research Office.
G. L. Gates, and W. H. Caraway.
U S Bureau of Mines Report of Investigations 7401, June 1970. 18 p, 4 fig, 7 tab, 25 ref.

Descriptors: *Water quality, *Water chemistry, *Water sources, *California, *Secondary recovery (Oil), Flooding, Injection, Oil fields, Oil reservoirs, Sea water, Fresh water, Brines, Irrigation water, Saline water, Permeability.
Identifiers: San Joaquin Valley (Calif).

Five possible sources of water for waterflooding of petroleum reservoirs in the arid San Joaquin Valley of California were considered. Three of them (water produced with petroleum, water from a shallow saline aquifer, and waste irrigation water) were analyzed chemically; laboratory information for sea water was developed in a previous study. A series of laboratory tests made on the fifth source (fresh water) determined the solubility of calcium sulfate dihydrate in water. Laboratory analyses included: chemical analyses of water produced with petroleum and waste irrigation water; solubility of calcium sulfate dihydrate in water and brines; the effect of excess sulfate on the solubility of calcium sulfate in brines; the presence of sulfate-reducing bacteria; and the permeability of cores from a petroleum reservoir. Most of the waters and mixtures of waters are compatible with petroleum reservoir waters and are generally suitable for injection. Formation damage due to clay swelling will not be serious. The waters most likely to be available for injection are water produced with petroleum, water from shallow saline aquifers, and waste irrigation water. (Knapp-USGS)

A WATER QUALITY MODEL OF CHLORIDES IN GREAT LAKES,
Manhattan Coll., Bronx, N.Y. Dept. of Civil Engineering.
Donald J. O'Connor, and John A. Mueller.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 96, No SA4, Paper 7470, p 955-975, August 1970. 14 fig, 6 tab, 23 ref, append.

Descriptors: *Water quality, *Great Lakes, *Chlorides, *Salt balance, *Mathematical models, Water balance, Streamflow, Hydrologic budget.
Identifiers: Water quality models.

The increase in the concentration of conservative substances in the Great Lakes is described by a simple time variable equation. The concentration of chlorides is related to the fresh water flow, the volumes of the lakes and the various sources--municipal, industrial, natural background and road deicing. The increase in concentration since 1900 is presented and projections are made of anticipated concentrations based on various assumptions of control. (Knapp-USGS)

PRELIMINARY STUDY OF TRANSVERSE BARS,
Florida State Univ., Tallahassee. Geophysical Fluid Dynamics Inst.
A. W. Niedoroda, and W. F. Tanner.
Marine Geology, Vol 9, No 1, p 41-62, June 1970. 22 p, 7 fig, 28 ref. ONR Contract N-00014-68-A-0159.

Descriptors: *Sand bars, *Sedimentary structures, *Beaches, *Sand waves, Sediment transport, Deposition (Sediments), Scour, Erosion, Currents (Water), Waves (Water).
Identifiers: Transverse bars, Beach structure.

Transverse bars (finger bars) are extremely common along sandy beaches in low-to-moderate wave energy regimes. They are typically oriented normal or nearly normal to the beach toe. Each transverse bar acts as a focusing lens for advancing waves, controlling wave refraction in such a way that: (1) the transverse bar is maintained; (2) sediment is transported along the long axis of the bar; and (3) a subtle but nevertheless effective circulation pattern is established, whereby water is transported seaward from the surf, without rip currents. In areas where transverse bars are numerous and well developed, the onshore or offshore transport of sand along the bar axes may be more important than littoral drift. Preliminary data indicate that current strength is a direct function of the depth of water over the bars and an exponential function of the initial wave height. (Knapp-USGS)

SAND RIBBONS OF EUROPEAN TIDAL SEAS,
National Inst. of Oceanography, Wormley (England).
Neil H. Kenyon.
Marine Geology, Vol 9, No 1, p 25-39, June 1970. 15 p, 12 fig, 22 ref.

Descriptors: *Bottom sediments, *Tides, *Currents (Water), *Continental shelf, *Sands, *Tidal waters, Oceans, Sedimentary structures, Sand bars, Sand waves, Sediments, Sediment transport, Sedimentation.
Identifiers: Sand ribbons, Europe.

Ribbons of sediment, up to 15 km long and up to 200 m wide, extend parallel to the bed load transport paths of the tidal currents. The ribbons have been found by the side-scan Asdic method in most of those areas of the sea floor around the British Isles where tidal currents have maximum near surface velocities of 2 knots or more. The four types of ribbons, distinguished by their form, are related to tidal current velocity and supply of sand. Underwater photographs taken in a sand ribbon zone reveal bodies of shelly sand usually too thin to mask completely the underlying coarse material, but sometimes thick enough for the formation of small-scale bedforms including ripple marks and sand shadows. There is a variety of underlying coarse material and locally there are accumulations between the sand ribbons of the more durable shells that may be more readily preserved in ribbon form than the sand itself. STUDIES OF THE MARINE MICROORGANISMS UTILIZING INORGANIC NITROGEN COMPOUNDS--IV. ON THE LIBERATION RATES OF INORGANIC NITROGEN COMPOUNDS FROM BOTTOM MUDS TO SEA WATER (In Japanese),
Kyoto Univ. (Japan). Dept. of Fisheries.
Yoichi Yoshida, and Masao Kimata.
English summary. Bulletin of the Japanese Society of Scientific Fisheries, Vol 35, No 3, p 303-306, 1969. 3 fig, 1 tab, 7 ref.

Descriptors: *Mud, *Sea water, *Nitrogen, Inorganic compounds, Ammonia, Nitrites, On site tests, Cores, Laboratory tests, Aphotic zone.
Identifiers: *Sea bottom muds, Inorganic nitrogen, Nitrate nitrogen, Maizuru Bay (Japan), Disphotic zone, Euphotic zone.

Release of ammonia, nitrite, and nitrate nitrogen from bottom muds to sea water was studied by direct sampling and by simulation of conditions in a small 60 centimeter-wide equarium. Analyses of water above the bottom and of mud cores, conducted from January till September 1967, showed the liberation of elemental nitrogen from 0.1 to 2.0 microgram per 100 square centimeter/hour. The largest part of the released nitrogen was in ammonia form. The trials under laboratory conditions yielded similar results, even though the bottom mud in aquarium contained predominantly nitrate nitrogen. (Wilde-Wisconsin)

TIME AND EXTENT OF A FLOW REVERSAL IN THE LOWER COLUMBIA RIVER,
Bureau of Commercial Fisheries, Seattle, Wash.
Shirley M. Clark, and George R. Snyder.
Limnology and Oceanography, Vol 14, No 6, November 1969, p 960-965. 3 fig, 2 tab, 3 ref.

Descriptors: *Cooling water, *Tidal effects, *Stagnant water, *Thermal powerplants, Heated water, Water temperature, Low flow, Tracers, Columbia River, Thermal pollution.
Identifiers: *Flow reversal.

Tracer study showed that because of the effect of tides, an extensive upstream movement of water can occur near Prescott during low flow stages of the Columbia River. Under these conditions, thermal electric plants would use the same water more than once for cooling their condensers and repeatedly subject fixed masses of water to their heated effluents. The reversal of the river would cause a periodic concentration of rejected heat from the thermal electric plant in sections of the river downstream producing an increase in the temperature of isolated volumes of water that is above the average rise for the river. Temperature rise was estimated. The study points out that this problem should be studied intensively to evaluate the biological risk before final designs of the proposed installations of power plants are accepted. 3A. Saline Water Conversion

DEVELOPMENT OF NEW REVERSE OSMOSIS MEMBRANES FOR DESALINATION,
North Star Research and Development Inst., Minneapolis, Minn.
L. T. Rozelle, J. E. Cadotte, and D. J. McClure.
For sale by Superintendent of documents, US Government Printing Office, Wash, DC 20402, Price $1.25. US Office of Saline Water Research and Development Progress Report No 531, June 1970. 124 p, 21 fig, 24 tab, 26 ref, 3 append. Contract No 14-01-0001-1696 OSW.

Descriptors: *Membranes, *Desalination, *Reverse osmosis, *Cellulose, *Plastics, Desalination processes, Permselective membranes, Semipermeable membranes, Research and development, Laboratory tests, Thin films, Permeability.
Identifiers: Ultrathin membranes.

A process was developed for forming ultrathin membranes by casting a cellulose acetate solution on a water surface. These membranes can provide greater than 99 percent salt rejection, and they could be formed as thin as 500 angstroms. A promising support film of polysulfone was also developed. The feasibility of casting ultrathin cellulose acetate membranes and the polysulfone support films in tubes was proved and the casting variables defined. These ultrathin membranes, along with the polysulfone support films, were successfully applied to commercial tubes and tested. Several successive membrane removals and replacements were carried out successfully in the commercial tubes without manual manipulation of the module. A number of new ultrathin membranes from mixed esters and ethers of cellulose acetate were found to exhibit water flux and flux decline properties superior to cellulose acetate. (Knapp-USGS)

SMALL DESALINATION UNIT TO TEST SCALE-REDUCTION ADDITIVES,
Rhode Island Univ., Kingston. Dept. of Chemical Engineering.
Niels Madsen.
Available from the Clearinghouse as PB-193 411, $3.00 in paper copy, $0.65 in microfiche. Completion Report, 1969. 19 p. OWRR Project A-020-RI (1).

Descriptors: *Desalination, *Scaling, *Flash distillation, *Heat transfer, *Model studies, *Testing, *Additives, *Scale deposition, *Scale prevention, *Multiple flash distillation, *Simulation.

A mathematical model of the reduction in the heat-transfer rate with elapsed time, when a scaling fluid is heated, is given. Considerations that were made during the design of a semi-portable heat transfer apparatus for simulating the heating of sea water in a multi-stage flash evaporation unit are presented. The results of several preliminary calibrations and tests, including a 12 hr. run with the maintenance of flow rate, outlet temperature, outlet pressure, and temperature driving force are presented. The testing was done with non-scaling water only. (Madsen-Rhode Island)

MODIFYING THE WATER BALANCE BY DESALINATION,
Geological Survey, Washington, D.C.; and Office of Saline Water, Washington, D.C.
Francis A. Kohout, and Milton S. Sachs.
In: Proceeding of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 214-222, 1969. 4 fig, 19 ref.

Descriptors: *Desalination, *Water costs, *Water balance, Water utilization, Water supply, Surveys, Reviews, Economics, Municipal water, Water resources development, Saline water, Groundwater, Saline water systems.
Identifiers: Desalination costs.

Desalination costs have decreased from about $5/1000 gallons in the early 1950's to about $1/1000 gallons for sea-water distillation in the late 1960's. These costs do not include delivery to the consumer. Because of the high cost, desalination has been considered as an alternate water-supply scheme where fresh-water deficiencies are great. However, two of the largest desalting plants in the United States are located in Florida, where annual

rainfall averages 50 to 60 inches per year. The seeming contradiction is related to subjective factors not always considered in the balance of conventional vs. desalted water costs. For example, public health departments and consumers in some areas are demanding better water than Nature can provide at an economical distance from the point of use. Desalination of previously unused, onsite saline water creates completely controllable, potable water which is free from economic, legal and political entanglements. Desalination is a factor that can be expected to substantially affect the water balance of North America. (See also W70-08597)

STATUS OF PILOT WATERSHED STUDIES IN ARIZONA,
Forest Service (USDA), Flagstaff, Ariz.
Harry E. Brown.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR 1, Paper 7129, p 11-23, March 1970. 11 fig, 30 ref.

Descriptors: *Small watersheds, *Demonstration watersheds, *Water yield improvement, *Rainfall-runoff relationships, *Arizona, Soil-water-plant relationships, Vegetation effects, Clear-cutting, Evapotranspiration control.
Identifiers: Experimental watersheds (Arizona).

Critical water shortage in Arizona have led to intensive investigations of methods for increasing streamflow from the State's watersheds. These investigations include research studies of hydrologic processes and behavior, pilot tests of promising treatments, economic studies, and surveys of potentially treatable areas. Results are reported from pilot tests in chaparral, juniper, ponderosa pine, and mixed conifer vegetation types. To date, streamflow responses following watershed treatments have varied from zero to as much as 9 inches per year, depending on the nature of the treatment, type of vegetation, and climate. These results and others forthcoming will play an important role in future multiple use management of forest lands in Arizona. (Knapp-USGS)

NEW WATER FOR NORTHERN PLAINS,
South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
Richard A. Schleusener.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR1, Paper 7145, p 53-60, March 1970. 1 fig, 1 tab, 6 ref. Contract No 14-06-D-5979 (Bu Rec), Contract No N60530-67-C-1289 (Navy).

Descriptors: *Cloud seeding, *Water yield improvement, *Weather modification, Projects, Artificial precipitation, Nucleation, Rainfall, On-site tests, Research and development, Analytical techniques, On-site investigations, Resource development.
Identifiers: Northern plains.

Current research in cloud seeding follows a plan to progress from experimental projects on individual clouds (or areas less than 1,000 sq miles) to pilot projects involving several thousand square miles to operational projects over areas of thousands of square miles. Research to date has shown that individual clouds exist that can be made to produce additional precipitation by seeding, and a beginning has been made on defining the meteorological conditions for which cloud seeding can produce additional usable precipitation. Results of cloud seeding for hail suppression are mixed. Pilot projects extending over several thousand square miles are now needed to determine whether the effects found on experimental projects can be extended to larger areas. There is a need to leave a limited number of cases (randomly selected) unseeded as controls to monitor the effects of the weather modification treatment. It is proposed that the fraction left unseeded change from 50% for experimental projects to 25% for pilot projects to 10% for operational projects. (Knapp-USGS)
W70-08950

RESPONSIBILITY IN WEATHER MODIFICATION OPERATION,
Fresno State Coll. Foundation, Calif. Atmospheric Water Resources Research; and South Dakota School of Mines and Technology, Rapid City. Inst. of Atmospheric Sciences.
Merlin C. Williams, and Richard A. Schleusener.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR1, Paper 7171, p 61-66, March 1970. 6 ref.

Descriptors: *Weather modification, *Water yield improvement, *Water law, *Regulation, Legal aspects, Management, Permits, Standards.
Identifiers: Weather-management regulation.

Recent experience has shown that weather modification can be used to produce beneficial changes in atmospheric processes. The possibility of using this new technology as a watershed management tool requires consideration of the conditions under which the tool is used and the responsibilities required for its use. Evidence resulting from a number of projects indicates that both benefit and disbenefits may result from treatment of extremely variable weather systems. The need for responsible operations can be met by assuring that the individuals involved in these activities have the requisite experience, education and ethical standards. A means for meeting this need is proposed through the identification of individuals with the necessary qualifications on a basis similar to engineering registration. (Knapp-USGS)

VEGETATION MANAGEMENT FOR WATER YIELD,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Marvin D. Hoover.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 191-195, 1969. 8 ref.

Descriptors: *Water yield improvement, *Forest management, *Watershed management, Water yield, Economics, Clear-cutting, Lumbering, Planting management, Vegetation effects, Rainfall-runoff relationships.
Identifiers: Vegetation management.

Large-scale management of forest lands for water may be possible because they are held in large blocks and much is publicly owned. Yield increases tend to be greater during normally high runoff periods and in wet years. Economic value of such yield increases depends on water uses in the basin and on available storage. Large areas in the West approach ideal vegetation patterns and are now yielding near their potential. Where tree products are merchantable, water increase can be a valuable by-product of timber harvesting. However, where timber is of low wood value or high efficiency in water production is desired, financing for water improvement must be found. Artificial augmentatio of precipitation appears to offer promise for moun tain areas which are often forest covered. Success ful weather modification would increase the eff ciency of vegetation management practices. (Se also W70-08597)

SOME RECENT RESEARCH IN EVAPORA TION SUPPRESSION,
Geological Survey, Denver, Colo.
G. Earl Harbeck, Jr.
In: Proceedings of Symposium on Water Balance i North America, June 23-26, 1969, Banff, Alberta Canada, American Water Resources Associatio Urbana, Illinois, p 201-213, 1969. 30 ref.

Descriptors: *Evaporation control, *Monomolecu lar films, *Reviews, Research and developmen Seepage, Reservoir evaporation, Water conserva tion, Reservoir leakage.
Identifiers: Geological Survey, Bureau of Reclam tion.

Since 1960 considerable research has been co ducted in the use of monomolecular films to su press evaporation. The studies of the U.S. Geolog cal Survey and the U. S. Bureau of Reclamation a reviewed. The Bureau of Reclamation als financed many other research projects in this fie undertaken by universities in the Rocky Mounta region. Much of the research was on methods applying and maintaining a film; the most succes ful techniques were film application using powde in emulsions, or by spraying molten materia Evaporation savings for the larger reservoirs we mostly about 20 percent or less. An unexpecte and unwelcome finding was that under some ci cumstances, seepage losses from small stock pon may be increased by the application of monolayer. (See also W70-08597)

WATER FOR INDUSTRIAL DEVELOPMENT IN CLARKE, JASPER, LAUDERDALE, NEWTON, SCOTT, AND SMITH COUNTIES,
Geological Survey, Jackson, Miss., Water Resources Div.
E. H. Boswell, F. H. Thomson, and D. E. Shattles.
U S Geological Survey Open-file (duplicated) Report, 1970. 62 p, 32 fig, 9 tab, 18 ref.

Descriptors: *Water resources, *Industrial water, *Mississippi, Groundwater, Streamflow, Water quality, Hydrogeology, Data collections, Hydrologic data, Water resources development, Aquifers, Water wells.
Identifiers: Clark County, Jasper County, Lauderdale County, Newton County, Scott County, Smith County.

Detailed information is presented on the availability, chemical quality, and physical characteristics of groundwater and surface water of this six-county area in east-central Mississippi. Designed as a guide for planning and developing industrial water supplies, the report contains 32 illustrations and 9 data tables. Illustrations include 14 maps, 6 geohydrologic sections, 4 flood profiles, and several graphs showing duration of low streamflow, relation of dissolved solids to discharge and time-drawdown relations of aquifers. In 85% of the area, at least one aquifer contains water suitable for general use with little or no treatment; the water is a soft sodium bicarbonate type usually with dissolved-solids content below that recommended for most industrial uses. Wells designed for high production can yield more than 15 mgd at many places. The fresh-water section averages 1,500 ft thick and attains about 3,500 ft in Smith County. In 80% of the area, low-flow yields are less than 0.05 cfs per sq mi. Average low-flow discharge from the area is 65 mgd, mostly by the Chickasawhay and Leaf Rivers; the streamflow is of good quality. Potential is large for development of surface supplies from storage reservoirs. (Lang-USGS)

Preprint. PCR-69-131, 1969 Annual Convention, Pacific Coast Region, American Society of Agricultural Engineers, Phoenix, Arizona, Mar 1969. 13 p, 1 fig, 7 tab, 8 ref.

Descriptors: *Sprinkler irrigation, *Vegetable crops, *Deserts, Crops, *Arid lands, *Vegetables, *Furrow irrigation, Planting management, Plant growth, Agriculture, Irrigation, Southwest U.S., Farm management, Saline soils, Mechanization, Seeding, Crop production, Crop response, Salinity, California, Lettuce.
Identifiers: *Comparative studies, *Crop yield, Night, Precision Planting, High temperature, Coachella Valley, Calif.

Field studies were conducted on arid mechanized farms in California to evaluate the use of sprinkler and furrow irrigation on plantings of lettuce and cabbage. The studies provided substantial evidence that major improvement in germination and emergence can be expected with sprinkler irrigation when compared with the standard practice of furrow irrigation. This response can be attributed to seed-zone salt control, but additional benefits might be expected from improved soil aeration. During high-temperature periods, growers might expect greater response to sprinkling if irrigation begins at night. If better germination can be assured with sprinklers, precision planting on saline soils will become practical. Because precision planting is the first important step in mechanized culture of vegetable crops, sprinklers will be an indispensable tool in mechanization--particularly in desert areas. (USBR)

SCHEDULING IRRIGATIONS USING CLIMATE-CROP-SOIL DATA,
Agricultural Research Service, Kimberly, Idaho. Snake River Research Center; Bureau of Reclamation, Denver, Colo.; and Salt River Valley Water Users' Association, Phoenix, Ariz.
Marvin E. Jensen, David C. N. Robb, and C. Eugene Franzoy.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR1, Paper 7131, p 25-38, March 1970. 1 fig, 3 tab, 30 ref, append.

Descriptors: *Irrigation efficiency, *Irrigation engineering, *Irrigation practices, *Irrigation design, *Timing, Irrigation systems, Digital computers, Water management (Applied), Water utilization, Soil-water-plant relationships, Water distribution (Applied), Evapotranspiration.
Identifiers: Irrigation scheduling.

The most important factor affecting irrigation efficiencies and crop yields is scheduling irrigations in time and amount. Overirrigation may result in waterlogged soils, a condition which reduces yields and generally results in increased costs for water, fertilizer, and drainage. Water use is at a minimum when the amount of water applied is just equal to the consumptive use and the leaching requirement. To achieve higher irrigation efficiencies, present irrigation scheduling practices must be improved. Irrigation scheduling using climate-crop-soil data, computers to facilitate the tedious computations, and field observations by experienced personnel is a service that appears to be very attractive to the modern irrigation farm manager. This service has the potential of increasing the management skills of the farmer and his net return at a reasonable cost. It supplements the art of irrigation or experienced judgement with the results of recent advances in irrigation science. (Knapp-USGS)

MILHOUS V STATE HIGHWAY DEP'T (UNCONSTITUTIONAL TAKING OF PROPERTY FOR PUBLIC USE VIA OBSTRUCTION OF NATURAL FLOW OF SURFACE WATERS).

8 SE2d 852-857 (S C 1940).

Descriptors: *South Carolina, *Obstruction to flow, *State governments, *Eminent domain, *Highway effects, Surface drainage, Surface runoff, Alteration of flow, Drainage practices, Drainage systems, Legal aspects, Judicial decisions, Condemnation, Public rights, Relative rights, Right-of-way, Roadbanks, Highways, Administrative agencies, Repulsion (Legal aspects), Riddance (Legal aspects), Surface waters, Ditches, Reservoirs, Impounded waters.
Identifiers: *Constitutions.

Plaintiff landowner contended that defendant Highway Department had taken his property for public use without just compensation. Defendant allegedly had razed the grade of the road adjacent to plaintiff's property, had destroyed a pit previously serving as a temporary reservoir for surplus rainfall, and had replaced a drainage ditch with inadequate ones. Plaintiff's drainage was rendered inadequate and his land flooded. Defendant sought to distinguish surface water from natural watercourses, and contended it would be liable only if it collected surface water and threw it with force onto the land of another. The appellate court held that, as to the state, liability exists whether the taking of the property is by stream obstruction, by casting impounded surface water with force on another's land, or by the obstruction of the natural flow of surface water. Under the common law an individual may defend his property against surface waters under the common enemy rule, and he is not liable for resulting damages to his neighbor's lands. However, the common law and the Constitution afford a remedy against the state for one whose property is unconstitutionally taken. (Price-Florida)
W70-08703

KEENER V ADDIS (DAMAGES FROM DRAINAGE DITCH DISCHARGE).

5 SE2d 695-703 (Ga Ct App 1939).

Descriptors: *Georgia, *Ditches, *Riddance (Legal), *Repulsion (Legal aspects), Damages, Drainage effects, Drainage, Conveyance structures, Drainage engineering, Water conveyance, Surface drainage, Drainage practices, Surface waters, Sediment discharge, Routing, Gravels, Sediments, Sands, Crops, Crop production, Farms, Judicial decisions, Legal aspects, Land use, Impounded waters.

Plaintiff brought action to recover from defendant for injury done plaintiff's land and crops by water from a drainage ditch built by defendant. Plaintiff alleged that defendant had collected surface water on his land and by way of the ditch had discharged it onto plaintiff's property. The water, sand and gravel deposited on plaintiff's land resulted in the land's becoming unfit for the production of crops. Defendant contended that plaintiff was under a duty to avoid the consequences of the alleged nuisance. The Court of Appeals of Georgia ruled that plaintiff was under no duty to avoid the consequences since such duty arises only where the act complained of is a negligent act. The facts showded a positive act by defendant, not negligence. The measure of damages was the actual loss caused by the injury to the property. The trial court's judgment for the plaintiff was affirmed. (Barker-Florida)
W70-08714

GROOVER V HIGHTOWER (FLOOD DAMAGE FROM DAM CONSTRUCTION).
1 SE2d 446-449 (Ga Ct App 1939).

Descriptors: *Georgia, *Dams, *Damages, *Obstruction to flow, Natural flow doctrine, Streamflow, Riparian rights, Relative rights, Dam construction, Damsites, Sites, Sediment control, Barriers, Dam design, Overflow, Water control, Flood damage, Crops, Crop production, Sediments, Land use, Judicial decisions, Legal aspects, Flooding, Floods.

Plaintiff upstream landowners brought action for damages against defendant for injury caused to plaintiff's crops and land as a result of a dam built by defendant downstream from plaintiff's property. Plaintiff claimed that the water from the stream had backed up, thereby flooding his land and preventing the production of corn. Plaintiff also contended that the dam had restricted the flow of the stream so that sand, trash and other matter had accumulated in the stream which further contributed to the overflowing and flooding of his land. Defendant argued that the water had not backed up as far as plaintiff alleged and that the flow through plaintiff's land had not been impeded by construction of the dam. The trial court excluded defendant's testimony as to the rate of flow and the jury returned a verdict for plaintiff. The Court of Appeals of Georgia ruled that the evidence as to whether the dam retarded the flow should have been submitted to the jury. The trial court's decision was reversed. (Baker-Florida)
W70-08715

DICKEY V YARBROUGH (EXECUTION OF PAROL LICENSE BECOMES EASEMENT TO USE OF DITCH).
197 SE 234-235 (Ga 1938).

Descriptors: *Georgia, *Easements, *Obstruction to flow, *Ditches, Flow, Ponds, Legal aspects, Judicial decisions, Flow resistance, Flow control, Drainage, Drainage water, Remedies, Damages, Water injury, Water transfer, Cultivation, Expenditures, Land clearing, Relative rights.
Identifiers: *Injunction (Permanent).

Plaintiff and defendant were adjoining landowners. A pond on plaintiff's land flowed into a ditch which extended onto defendant's property. Defendant granted a parole license to plaintiff which authorized him to open and use the ditch in order to drain the pond. In reliance upon such authorization, plaintiff expended six dollars for the purpose of clearing the ditch. However, defendant subsequently threatened to close the ditch and actually placed obstructions therein. Plaintiff sought an injunction to prevent defendant from placing further obstructions in the ditch and from interfering with plaintiff's use of the ditch. Plaintiff maintained that if the ditch were closed, water would accumulate on his land and thereby cause him to incur damages, since a number of acres would be unfit for use and cultivation. In holding for plaintiff, the court stated that the parole license to open and use the ditch for the purpose of draining plaintiff's pond was irrevocable, and that plaintiff executed the license in making an expenditure, which converted such license into an easement running with the land. (Finman-Florida)
W70-08716

ELDER V BARNES (UPPER LANDOWNER REQUIRED TO REMOVE OBSTRUCTIONS FROM NATURAL DRAINAGE SYSTEM).

219 N C 411, 14 SE2d 249-252 (1941).

Descriptors: *North Carolina, *Obstruction to flow, *Natural streams, *Drainage systems, Depth, Downstream, Flow, Natural flow, Non-navigable waters, Surface waters, Channel improvement, Drainage, Legal aspects, Judicial decisions, Adjudication procedure, Natural flow doctrine, Relative rights, Riparian land, Riparian rights, Riparian waters, Surface runoff, Remedies, Repulsion (Legal aspects), Riddance (Legal aspects).

Plaintiff upper riparian landowner sought an order requiring defendant lower landowner to remove obstructions from a branch which ran through defendant's land and which had been the natural drain for plaintiff's land for forty years. The obstruction had caused water to collect on plaintiff's property. Defendant was ordered by the lower court to clear the branch and to improve a portion of it by constructing a ditch therein. Plaintiff was to improve another section of the branch in a like manner. Plaintiff complied with the order, but the defendant did not. The appellate court held that the evidence was sufficient to sustain the order of the lower court finding the defendant in contempt. Moreover, the lower court had acted within its power. The order was affirmed. (Price-Florida)
W70-08732

RICHMOND V DRAINAGE COMM'RS (RIGHT OF ACCESS TO LAND ACROSS DRAINAGE DITCH).
295 Ill App 338, 15 NE2d 6-8 (1938).

Descriptors: *Illinois, *Drainage districts, *Access routes, *Bridge construction, Bridges, Drainage systems, Local governments, Ditches, Tile drainage, Drains, Farms, Land tenure, Legislation, Administration, Judicial decisions, Legal aspects, Relative rights, Remedies, Administrative agencies.
Identifiers: Mandamus.

Plaintiff, in a petition for mandamus, sought an order requiring defendant drainage district to rebuild a bridge across a ditch running through plaintiff's farm. Defendant contended it was under no legal obligation to build the bridge. The court held that under the state's existing Farm Drainage Act the commissioners were not required to build the bridge. However, under a 1927 act plaintiff had the right, if necessary for free access to an enclosed parcel of land, to require the drainage district to build the bridge across the drain. The court noted that the area to which access was sought was enclosed by fences, and it would be necessary for plaintiff to travel a distance of four miles to reach the land if the bridge were not built. Therefore, the court found the site in question to be an 'enclosed' parcel of land within the meaning of the statute and held for plaintiff. (Hubener-Florida)

KIRK V NORFOLK AND W RY (RECOVERY FOR PERMANENT WATER INJURY BARS FUTURE RECOVERY OF DAMAGES).

196 SE 501-503 (W Va 1938).

Descriptors: *West Virginia, *Pipes, *Railroads, *Overflow, Flow control, Remedies, Water injury, Damages, Flooding, Real property, Judicial decisions, Legal aspects, Darinage water, Drainage effects, Drainage systems, Surface waters, Flood control, Construction, Maintenance, Right-of-way, Flood damage, Floodwater.
Identifiers: *Permanent nuisance, Damages (Permanent).

Plaintiff owned a tract of land, abutting defendant railway company's roadbed and tracks, which defendant had constructed pursuant to a right-of-way granted by plaintiff's predecessor in title. Waters from nearby hills overflowed onto the tract through two drain pipes which defendant maintained under

its roadbed. Preciously, defendant had been held liable to plaintiff's predecessor in title for such damages to the tract which resulted from the flooded condition caused by this drainage. Subsequently, plaintiff purchased the tract and brought action to recover temporary damages from defendant which resulted from waters being drained onto plaintiff's property through the same drain pipes. Defendant contended that plaintiff was prohibited from collecting damages since a judgment for permanent injury had previously been awarded against defendant involving this same real property. The court held that the previous judgment and award of permanent damages to plaintiff's predecessor in title against defendant was a bar to plaintiff's recovery. As the construction and maintenance of the drain pipes under the roadbed caused a nuisance of a permanent nature, the court stated that the recovery of damages in the prior suit was permanent and final. MODIFICATION OF THE RIPARIAN THEORY AND DUE PROCESS IN MISSOURI,
James D. Ellis.
Missouri Law Review, Vol 34, 1969, p 562-574.

Descriptors: *Missouri, *Riparian rights, *Water rights, *Prior appropriation, Water law, Permits, Water permits, Legal aspects, Legislation, State governments, Judicial decisions, Control, Administrative agencies, Regulation, Public health, Water allocation (Policy), Planning, Water policy.

The inefficiency and wasteful methods of regulating water use under the riparian doctrine have led some states to depart from riparian theory in favor of comprehensive regulatory acts concerning water use. Such states as South Dakota, Kansas, Oregon, Minnesota and Iowa have all followed this course and provide possible models for Missouri in changing riparian control. These acts generally preserve vested riparian interests as long as they are used in a beneficial manner. Courts have upheld the acts as valid exercises of the police power. Some of the acts provide for a state agency to establish a permit system to regulate the appropriation of water. The crucial question in state regulation is whether a riparian owner is entitled to compensation if his rights to the water are impaired. A South Dakota court has held that water rights are not sufficient property interests to allow the invocation of the right not to be deprived of property without due process of law, although that theory may not be acceptable in Missouri. However, it is possible that unexercised riparian rights may be curtailed without compensation being given. (Hubener-Florida)

ZONING THE FLOOD PLAINS OF OHIO.
Toledo Law Review, Vol 1969, p 655-676.

Descriptors: *Ohio, *Flood plain zoning, *Land use, *Rivers, Cities, Urbanization, Industries, Local governments, Sites, Water utilization, Regulation, Legislation, Flood plains, Flood damage, Building codes, Flood control, Flood plain insurance, Flood protection, Legal aspects, Regulation.

Prevention of flood damage can be accomplished most effectively by sound flood control programs and regulation of land development in areas subject to flooding by such means as zoning, subdivision regulation, building codes and community development policies. Flood plain zoning ordinances may be enacted pursuant to a state's police power if they are within the scope of state zoning enabling statutes. The most useful policy would be to permit some industries which are highly dependant upon water to locate within the flood plain if they would adopt necessary modes of floodproofing. However, residential areas should be excluded from flood plains since they have no need for locating near water and generally cannot afford the costs of floodproofing. In Ohio such zoning practices have been successfully utilized in urban areas but have not been effective in rural areas. The trend in Ohio is to the increasing use of restrictions on flood plain development. Increasing use of regulations should be spurred by the fact that such regulations are required for communities to qualify for federal flood insurance under the 1968 Housing Act. (Hubener-Florida)

COLE V BRADFORD (NO DUTY TO SHARE EXPENSES FOR REMOVING NATURALLY OCCURRING OBSTRUCTIONS).
184 SE 901-902 (Ga Ct App 1936).

Descriptors: *Georgia, *Obstruction to flow, *Natural flow, *Riparian rights, Remedies, Legal aspects, Judicial decisions, Riparian land, Riparian waters, Natural flow doctrine, Alteration of flow, Diversion, Water law, Overflow, Streamflow, Streams, Expenditures, Real property, Water injury, Duty of water, Relative rights.

Naturally occurring obstructions from defendant's lower riparian property caused stream water to overflow onto plaintiff's upper riparian land. Plaintiff requested permission to enter defendant's land, after due notice, in order to clear the stream of such obstructions, and furthermore requested defendant to share the expenses of removing these obstructions. Defendant permitted plaintiff to enter upon his property to clear the stream, but insisted that this was to be done at plaintiff's own expense. Plaintiff brought action to compel defendant to share these expenses. The court stated the rule that an upper riparian owner is entitled to have the water of a stream flow naturally from his land, but a riparian owner is not to be held responsible for the effects of nature which cause obstructions in a stream. Furthermore, such riparian owner owes on duty to either a lower or upper riparian owner to remove such naturally occurring obstructions. Therefore, as defendant was under no duty to remove these obstructions, the court held he was not liable to share plaintiff's expenses in removing such obstructions. (Finman-Florida)

COMM'RS OF UNION DRAINAGE DIST NO 1 v COMM'RS OF UNION DRAINAGE DIST NO 2 (APPORTIONING COSTS OF DRAINAGE DISTRICT IMPROVEMENTS).
373 111 347, 26 NE 2d 85-88 (1940).

Descriptors: *Illinois, *Drainage districts, *Drainage systems, *Cost sharing, Cost repayment, Local governments, Ditches, Drains, Farms, Land tenure, Bridge construction, Legislation, Administration, Judicial decisions, Legal aspects, Compensation, Bridges, Flood control, Silting, Watersheds (Basins), Administrative agencies, Administration.

The commissioners of plaintiff drainage district instituted this proceeding to determine what share of the cost of cleaning and widening the main ditch in their district should be borne by defendant, an adjoining drainage district. Plaintiffs also requested that defendants should bear a portion of the costs of lengthening bridges spanning the ditch. Although evidence conflicted as to the benefits defendants obtained from the project and from plaintiffs' drainage ditch, the court held that the preponderance of the evidence showed defendant district was benefited by the cleaning and widening of the ditch in question. Since the land in both districts was part of the same watershed, and since plaintiffs' land sloped gradually down into defendants' land, the court noted that land would be flooded in both districts if no ditches were constructed. Defendant would also be benefited in that water would flow faster from plaintiffs' ditch and tend to loosen silt in defendants' ditch. The court ordered that costs be shared in proportion to the area of land in each district. Also, a share of the cost of bridge lengthening was properly chargeable to defendants. (Hubener-Florida)

R DUNKEL, INC V BARLETTA CO (OBSTRUCTION OF UNDERGROUND STREAM).
18 NE2d 377-379 (Mass 1938).

Descriptors: *Massachusetts, *Streamflow, *Obstruction to flow, *Conduits, Alteration of flow, Average flow, Culverts, Structures, Cofferdams, Outlet works, Overflow, Control structures, Damages, Legislation, State governments, Underground, Subsurface waters, Underflow, Judicial decisions, Legal aspects, Construction.
Identifiers: *Negligence.

A creek flowed through a culvert located beneath the floor of a basement in plaintiff's buildings. Following a heavy rain, water overflowed the culvert and entered the basement, causing damage to goods stored therein. Plaintiff sued defendants who were constructing a conduit to lead water away from plaintiff's premises. Plaintiff alleged that negligent methods caused obstruction to the flow of the creek which resulted in the overflow into his basement. Plaintiff contended that creation of the obstruction was negligence per se. The court, in holding for defendants, stated that the conduit could not have been constructed without obstructing flow and, therefore, defendant was not liable unless the erection of the obstruction was performed in a negligent manner. The question of negligence was for a jury to decide. As the acts of defendants were required in the performance of a contract with the state, plaintiff's remedy was confined to the means provided in the statute which authorized the construction of the conduit. PERFORMANCE OF AN ASPHALT TREATED DRAINAGE BLANKET IN A FLEXIBLE PAVEMENT SECTION,
California State Div. of Highways. Materials and Research Dept.
Travis Smith, Raymond Forsyth, and Wesley Gray.
Interim Report M and R No 632618, Dec 69, 43 p, 14 fig, 4 tab, 7 ref.

Descriptors: *Paving, *Drainage, *Highways, Road construction, Asphalt, California, Performance.
Identifiers: Drainage blankets, *Flexible pavements.

The paper presents the results of a field evaluation of a two-layer highway drainage system on Road 299 between Arcata and Willow Creek in the northern coastal region of California. The experimental section consisted of 400 feet utilizing a two-layer drainage blanket, the top, or drainage element, of which was stabilized with asphalt and 200 feet of normal single-layer drainage blanket to

serve as a control. The section was located in a cut section with numerous springs and seeps in a high rainfall area. Both sections effectively drained all subsurface water at the site through an unusually wet winter and spring.

4B. Groundwater Management

RESISTANCE NETWORK FOR THREE-DIMENSIONAL UNCONFINED GROUNDWATER PROBLEMS WITH EXAMPLES OF DEEP WELL DEWATERING,
Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton, and R. Herbert.
The Institute of Civil Engineers - Proceedings, Vol 45, Session 1969-70, p 471-490, March 1970. 14 fig, 18 ref, 1 append.

Descriptors: *Resistance networks, *Aquifers, *Groundwater, *Mathematical (Studies), Models, *Numerical analysis, Deep wells, Cutoff walls, Design.
Identifiers: Multiwell dewatering installation.

The use of the electrical resistance network in analyzing complex unconfined groundwater flow problems was discussed. The first part was concerned with the techniques of representing the aquifer, wells and cut-off walls and also stationary and moving water tables. The resistance network method was described and illustrated by considering a full-time varient solution. The factors affecting a groundwater solution were listed. Mathematical solutions to unconfined well problems were divided into two groups. The first group consisted of formulae which assumed only horizontal flow because the water table is effectively horizontal. In the second type, the flow is not horizontal. Owing to the limitation of mathematical solutions, numerical solutions to groundwater problems were attempted. The resistance network solution can include wells, cut-off walls and any form of non-homogeneous aquifer and was used for a variety of practical engineering problems. The analysis of a multiwell dewatering installation was shown as an example of a quick, more economical technique. The results from many different dewatering systems were summarized and an approximate design method based on the results was proposed. The design method was then tested against a dewatering problem for which a case history was available. The accuracy and implications of the design method were discussed. (Kriss-Cornell)

4C. Effects on Water of Man's Non-Water Activities

ENVIRONMENTAL IMPACT OF THE BIG CYPRESS SWAMP JETPORT.
Department of the Interior, Washington, D.C.

U S Department of the Interior Report, 1969. 153 p, 19 fig, 4 tab.

Descriptors: *Urbanization, *Ecology, *Swamp, *Florida, *Airports, Aquatic environment, Marshes, Drainage systems, Land use, Environmental effects, Habitats, Highway effects, Ecosystems.
Identifiers: Florida jetport, Big Cypress Swamp, Everglades Park.

Development of the proposed Big Cypress Swamp jetport, Florida and attendant facilities will lead to land drainage and development for agriculture, industry, housing, transportation, and services in the Swamp which will destroy the south Florida ecosystem and Everglades National Park. Construction of each training strip will destroy about 400 acres of natural habitat. No significant problems are expected from the limited sewage, industrial wastes or pesticides in the training phase. Air pollutants from engine exhausts will be substantial. There will be frequent high level noise intrusion on the wilderness character of the northern part of Everglades National Park and even more on the Big Cypress and Conservation Area No. 3. A severe bird strike problem may develop within the airport boundaries. With sufficient culverts provided through runways, ramps, roads, and other facilities, interference with overland flow will be negligible. The combination of bird strikes, pest insect problems and incidence of small animals on runways will probably lead to drainage of at least part of the jetport property. Construction and imminent operation of the first training strip have elevated surrounding land prices and sales. Economic and social pressures for further development within and without the port property will mount rapidly. Land development and drainage will be accompanied by increased nutrients in the water, will alter the hydroperiod, and will promote eutrophication. (Lang-USGS)

URBANIZATION AND THE WATER BALANCE,
Geological Survey, Washington, D.C. Water Resources Div.
Andrew M. Spieker.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 182-187, 1969. 2 fig, 8 ref.

Descriptors: *Urbanization, *Rainfall-runoff relationships, *Water pollution sources, Cities, Silts, Time lag, Sediment load, Erosion, Silting, Water supply, Waste disposal, Withdrawal, Surface-groundwater relationships, Subsidence, Floods, Hydrographs, Peak discharge, Low flow.
Identifiers: Urban hydrology, North America.

Urbanization modifies the hydrologic balance by causing changes in the distribution and quality of water in time and place. The overall quantity of water, however, remains essentially unchanged. In extreme cases, the lack of adequate management measures can result in catastrophic events. Several examples are cited. In 1969 floods in southern California were intensified by uncontrolled urban sprawl in alluvial fans and canyons. Sewering of urbanized areas on Long Island has caused an increase in direct runoff and flood peaks, and a lowering of groundwater levels. Detailed studies of storm runoff in Fairfax County, Virginia, have shown that urbanization in small watersheds increases peak flow by 2 to 3 times, and shortens the lag time by about 8 times. Intensive construction in urbanizing areas can result in sharply increased sediment loads in streams and lakes. Chemical and bacterial quality of water are also affected by urbanization. Studies of Salt Creek, a small stream in suburban Chicago, indicate high coliform and BOD levels at both low and high flows. Coliform counts are greater at high flows, resulting from combined sewer overflows. (See also W70-08597)

4D. Watershed Protection

AN OPERATIONAL WATERSHED MODEL STEP 1-B: REGULATION OF WATER LEVELS IN THE KISSIMMEE RIVER BASIN,
Central and Southern Florida Flood Control District, West Palm Beach.
Lalit K. Sinha.
Water Resources Bulletin, Vol 6, No 2, p 209-221, March-April 1970. 5 fig, 3 tab, 12 ref.

Descriptors: *Mathematical models, *Simulation analysis, *Watershed management, *Water levels, *Spatial distribution, *Temporal distribution, Gradually varied flow, Spillway gates, Lake stages, Florida.
Identifiers: Mean daily water surface elevation, Kissimmee River Basin.

Step - 1B in the first phase of an 'Operational Watershed Model' recently initiated by the Central and Southern Florida Flood Control District for managing its water resources was to compute water surface elevation, spatially and temporarily, in the Kissimmee River Basin system of reservoirs, channels and spillways. The approach was based upon the principles of gradually varied flow and consisted of two parts. One, a qualitative delineation of the basin into typical systems and two, the development of mathematical models to compute lake stage as a function of storage, and to compute discharge through the control structures as a function of gate opening and differential head across the structures. Their feasibility for application was demonstrated by the simulation of mean daily water surface elevation for a period of two years on the tail side of one typical gated spillway and on the head side of another gated spillway. (Kriss-Cornell)

R. M. Gale.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 141-154, Vol 1, 1969. 14 p, 7 ref.

Descriptors: *Water quality, *Monitoring, *Sampling, *Instrumentation, Data processing, Data transmission, Telemetry, Data collections, Water pollution, Water chemistry, Water analysis.
Identifiers: Water quality instrumentation, Canada.

The methods used in Canada for water quality monitoring and water sampling are discussed and the advantages and disadvantages of these methods are pointed out. The factors which govern the need for and the location of water quality instrumentation are discussed, with particular emphasis on economics. Installation methods to meet specific requirements under conditions such as weather and location are described. Methods of recording, transmitting and processing data produced by monitoring equipment are outlined and the usefulness of these data in determining water quality variations, optimum sampling frequencies, and general pollution conditions are briefly discussed. THE QUANTITATIVE RELATION OF BACTERIA AND CILIATES TO WATER POLLUTION,
Czechoslovak Academy of Sciences, Prague. Hydrobiological Station.
Vera Straskrabova, and Milos Legner.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Caechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 57-67, 1969. 11 p, 6 fig, 3 tab, 13 ref.

Descriptors: *Biomass, *Bacteria, *Protozoa, *Water pollution, Biochemical oxygen demand, Dissolved oxygen, Reservoirs, Streams, Rivers, Sewage, Foreign research, Bioindicators.
Identifiers: Czechoslovakia.

To study the quantitative relationships between organisms and the organic load in stream self-purification, 195 water samples were analyzed from reservoirs, brooks, rivers and sewage. All the organisms studied showed a direct relationship between their quantity and concentration of decomposable organic substances present. The bacterial numbers to BOD ratio was different in static and flowing waters for colonies on beef-peptone agar, whereas for direct counts on membrane filters no difference between the two types of water bodies was found. Most of the planktonic bacteria in moderately polluted surface waters are unable to grow on agar media. The relationship between the production of ciliates and the bacterial number was different for different species. (Woodard-USGS)

A RAPID METHOD FOR ORTHOPHOSPHATE ANALYSIS AT HIGH CONCENTRATIONS IN WATER,
National Inst. for Water Research, Pretoria (South Africa).
J. E. Harwood, R. A. van Steenderen, and A. L. Kuhn.
Water Research, Vol 3, p 417-423, 1969. 2 fig, 1 tab, 18 ref.

Descriptors: *Phosphorus, *Analysis, Calibrations, Analytical techniques, Phosphorus compounds.
Identifiers: Orthophosphates, Organic phosphorus, Antimony, Ascorbic acid.

Range of linear portion of calibration curve for determination of orthophosphate by Murphy and Riley (1962) method is increased by using greater quantities of antimony. Antimony as a catalyst was found to be bound in 1:1 ratio with ascorbic acid reduced molybdophosphoric acid complex. Range of phosphorus tested was 10-150 micrograms. Sensitivity was not appreciably increased. Proposed method can be extended to trace quantities by using large aliquots and/or larger cell path length. Interference from condensed phosphates and cyanic phosphate was minimal. Interference from labile phosphorus was significant. (Bannerman-Wisconsin)

THE APPLICATION OF PHASE SELECTIVE ALTERNATING CURRENT POLAROGRAPHY TO THE ANALYSIS OF HEAVY METALS IN WATER,
Georgia Inst. of Tech., Atlanta. Environmental Resources Center.
Peter E. Sturrock, and Robert L. Poole, Jr.
Available from the Clearinghouse as PB-193 412, $3.00 in paper copy, $0.65 in microfiche. Completion Report, June 1970. 55 p, 4 fig, 21 ref. OWRR Project A-020-GA (1).

Descriptors: *Polarographic analysis, *Heavy metals, *Electrolysis, *Aqueous solutions, *Elec-

troanalytical techniques, Electrolytes, Ions, Water pollution, Water treatment.
Identifiers: *Alternating current polarography, *Square-wave polarography.

The suitability was investigated of phase selective alternating current polarography and square-wave polarography for analyzing water for low concentrations of heavy metal ions. The application of phase selective alternating current polarography for analysis of heavy metals in water is examined in detail. Use of square-wave polarography is examined to a lesser degree. A variety of heavy metal ions are examined and optimum conditions for analyzing the individual ions are documented. Conditions are given for analyzing various multicomponent mixtures. Problems due to interferences from surfactants on ac polarographic techniques and methods for eliminating interferences are set out. Both selective ac and square-wave polarography were suitable for water analysis. Square-wave polarography was the more sensitive. The selective ac technique was very suitable for analysis of multicomponent systems. (Conway-Georgia)

AN APPROACH TO DETERMINE THE MINIMUM ALLOWABLE FLOW IN THE 'TISZA' RIVER FROM THE VIEWPOINT OF WATER QUALITY,
Research Inst. for Water Resources Development, Budapest (Hungary).
Bela Hock.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 75-86, 1969. 12 p, 4 fig, 3 tab, 10 ref.

Descriptors: *Forecasting, *Water quality, *Reservoirs, *Irrigation water, *Water quality control, Water resources, Streamflow, Biochemical oxygen demand, River forecasting, River regulation, Equations, Foreign research.
Identifiers: *Tisza River (Hungary).

Existing reservoirs and future construction of water storage systems on the Tisza River in Hungary for irrigation purposes will fundamentally change the water regime of the river and create problems regarding water pollution management. To solve these problems, forecasting the future water quality is necessary. The correlation between the different components of water quality and the flow are characterized by equations. By using the appropriate corrections, the equations can be used for forecasting water quality of the river in 1980. The minimum allowable flow from the reservoir is based on a maximum concentration of 10 mg/l permanganate biochemical oxygen demand value. (Woodard-USGS)

Identifiers: *Industrailization, Ara Valley, Tokyo (Japan).

Water pollution control of rivers flowing through metropolitan areas requires particular study in Japan because of the many problems created by the rapid pace of urbanization and industrialization. In 1985 about 80% of Japan's population will dwell in urban areas and industrial production will be 7-8 times greater than at present. With these drastic developments it is necessary to determine how rivers may be maintained free of pollution. A plan is proposed for water conservation in Japan, illustrated by the Ara Valley Area, a typical polluted river in the Tokyo Metropolitan Area, as a case study. A general description is given of the present and future conditions of the Ara River Basin. Future water demands and pollution loads are predicted. Regulation of industrial development is proposed as a regional planning approach to overcome an inevitable water quality deterioration, and the effects of regulation of industrial development are considered. A systems analytical method is applied to obtain an economically and technically optimum water conservation plan for the proposed basin. (Woodard-USGS)

THE PREDICTION OF THE DISTRIBUTION OF DISSOLVED OXYGEN IN RIVERS,
Water Pollution Research Lab., Stevenage (England).
M. Owens, G. Knowles, and Anne Clark.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 125-137, 1969. 13 p, 7 fig, 2 tab, 19 ref.

Descriptors: *Water quality, *Forecasting, *Dissolved oxygen, *Rivers, Velocity, Equations, Light intensity, Temperature, Aquatic weeds, Photosynthesis, Foreign research.
Identifiers: River Ivel (England).

Equations are formulated for predicting the widely varying concentrations of dissolved oxygen that occur in a non-polluted reach of a shallow river (River Ivel, in England) from such data as light intensity, temperature, amount of aquatic weed present, initial oxygen content, and photosynthetic and respiratory rates of aquatic plants and benthic material. DIGITAL SIMULATION SYSTEM FOR PREDICTION OF WATER QUALITY,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
R. T. Jaske.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 261-271, 1969. 11 p, 6 fig, 2 tab, 10 ref. AEC Contract AT (45-1) 1830.

Descriptors: *Forecasting, *Water quality, *Digital computers, *Systems analysis, *Columbia River, Equations, Meteorological data, Streamflow, Channel morphology, Biochemical oxygen demand, Dissolved oxygen, Density currents.
Identifiers: *Time-of-travel (Streams).

Water releases from Lake Roosevelt and other impoundments in the Columbia River between the Grand Coulee Dam and the Hanford plant have increased the travel time, introduced complicating density currents, and generally made a digital simulation system necessary to take advantage of the use of a great number of separate coefficients. Statistical studies are not necessary for each studied reach, and readily available dimensional, flow and weather data may be used. The basic system is readily adapted to the addition or deletion of subprograms without requiring the necessity to remeasure the overall coefficients. Further, the system is capable of adjusting, variables stochastically in response to primary inputs. The system when tested against a set of real data is capable of synthesizing to within 10% on short runs and less than 10% of records on longer runs. Temperatures have been consistently predicted to an accuracy of 0.25 deg C over a yearly period between regional points 200 to 500 km apart using a maximum of three weather station inputs. INVESTIGATIONS OF THE RESIDUES OF CHLORINATED INSECTICIDES IN GROUNDWATER (In Italian),
Florence Univ. (Italy). Inst. of Hygiene.
C. Grasso.
Bollettino della Societa Italiana di Biologia Sperimentale, Vol 44, No 20, p 1701-1702, 1968.

Descriptors: *Groundwater, *Chlorinated hydrocarbon pesticide, Osmosis, Insecticides, Water purification, Soils.
Identifiers: Italy, Natural filtration.

Studies were made to determine whether insecticide residues are present in subterranean waters or whether they are eliminated by natural filtration; and whether substrates retain greater amounts of chlorinated insecticides than eliminated by artificial purification. Sampling included oligotrophic, mesotrophic and eutrophic waters and springs of different geophysical characteristics and in localities of diversified agricultural exploitation. Sampling was accomplished by gas chromatographic method with an electron capture detector (strontium-90). No chromotograms evidenced chlorinated insecticidal residues. Natural filtration adsorbs undesirable chemicals which have a prolonged life in soils, water, food, and animal organs. (Auen-Wisconsin)

RESEARCH OF THE RESIDUES OF CHLORINATED INSECTICIDES IN THE SURFACE WATER USED FOR DRINKING (In Italian),
Florence Univ. (Italy). Inst. of Hygiene.
C. Grasso.
Bollettino della Societa Italiana di Biologia Sperimentale, Vol 44, No 20, p 1702-1703, 1968.

Descriptors: *Insecticides, *Potable water, *Chlorinated hydrocarbon pesticides, Water pollution effects, Water pollution sources, Chlorination, Toxicity, Surface waters, Water purification.
Identifiers: Italy, Arno River, Bientino River.

nsecticide usage, initially in agriculture, has extended its scope to the realm of hygiene, sanitation, nd disease prevention. The residual toxicity was esearched in potable waters of the Arno and Bienino Rivers (Italy) as well as the efficacy of purifiation plants located at Anconella (Florence) and t Stagno (Liverno). Sampling was concentrated ear the purification plants, analyses detecting the ollowing chlorinated insecticides (listed in escending order of ppm): lindane, heptachlor, poxide of heptachlor, aldrin, dieldrin, DDE, DDD, nd pp'DDT. No organophosphate insecticides ere detected and it was surmised that they were egraded by the alkaline water of the rivers (pH .8-8.3). Unpurified water contained relatively low nsecticide concentrations, ostensibly diminished y sedimentation, flocculation, and filtration. hlorination failed to produce detectable results. Hypothetical conclusion is that insecticide concenrations are decreased by physico-mechanical rocesses, with no evident effect exerted by hlorination at the rate of 1 milligram/liter. NITRATE CONTENT OF THE UPPER RIO GRANDE AS INFLUENCED BY NITROGEN FERTILIZATION OF ADJACENT IRRIGATED LANDS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.; Bureau of Reclamation, El Paso, Tex.; and International Boundary and Water Commission, El Paso, Tex.
C. A. Bower, and L. V. Wilcox.
Soil Science Society of America Proceedings, Vol 33, No 6, 1969. 1 fig, 3 tab, 11 ref.

Descriptors: *Nitrates, *Nitrogen, *Rio Grande, *Subsurface drainage, Drainage water, Salinity, Fertilizers, Groundwater, Irrigation effects, Leaching, Denitrification, River flow, Water pollution sources.
Identifiers: Upper Rio Grande, Salt balance.

An analysis of salt balance conditions on three irrigated areas along Upper Rio Grande between 1934-1963 is summarized. Nitrate content of water before irrigation and of drainage water was of specific interest. During 30-year period amount of nitrogen fertilizer applied increased by 35- to 100-fold. Decreasing annual river flows were major cause of significant increase of average annual nitrate load of river between 1954-1963 period. Increased use of nitrogen fertilizer in three areas has not increased overall nitrate nitrogen in Upper Rio Grande. El Paso Valley has slightly increased river nitrate nitrogen due to very low flows and sewage effluent. Insignificant contribution of nitrate nitrogen load to river from Rincon and Mesilla valleys was result of denitrification of leached nitrate nitrogen under anaerobic conditions in water saturated soil. (Bannerman-Wisconsin)

2,4-D CONTAMINATION AND PERSISTENCE IN IRRIGATION WATER,
Bureau of Reclamation, Denver, Colo.
T. R. Bartley, and A. R. Hattrup.
Paper at 23rd Annual Meeting of Western Society of Weed Scientists, Sacramento, Calif, Mar 1970. 32 p, 13 fig, 1 tab.

Descriptors: *Irrigation canals, Irrigation ditches, Spraying, *2-4-D, *Irrigation water, Water quality, Water analysis, Water sampling, Weeds, Herbicides, *Pesticide residues, Pesticides, Tolerances (Plant), *Weed control, Contamination, Water pollution sources, Water pollution.
Identifiers: Columbia Basin Project, Wash.

Concentration of 2,4-D in irrigation water and the rate of decline as the water moved downstream were studied by analyzing water samples collected from 18 irrigation canals on the Columbia Basin Project, Wash. The ditchbanks along these canals received routine applications of 2,4-D for control of weeds. Maximum concentration of 2,4-D found in each canal ranged as follows: 6 to 28 ppb in 9 canals, 38 to 100 ppb in 8 canals, and 214 ppb in one canal. In the 9 canals having the very low concentrations, the decline of the peak level of 2,4-D was very gradual as the water moved downstream. The peak levels in the canals with the higher concentrations showed some rises and declines at sampling stations below the first sampling site. This study indicates that the dimethylamine formulation of 2,4-D is persistent for several miles in irrigation water without much decline in concentration. In most cases, those canals carrying the greater quantity of water (74 to 840 cfs) contained the lowest levels of 2,4-D, and the higher levels occurred in flows ranging from 6.8 to 56 cfs. Waterflow, application rate, and herbicide spray overlap onto the water surface are major factors influencing herbicide concentration in irrigation water. (USBR)

THE BOD OF TEXTILE CHEMICALS,
American Association of Textile Chemist and Colorists, Durham, N.C.
William Stafford, and Harold J. Northup.
American Dyestuff Reporter, Vol. 44, No. 11, p 355-359, May 23, 1955. 1 tab, 1 fig, 8 ref.

Descriptors: *Biochemical oxygen demand, Water pollution, Rhode Island, Detergents.
Identifiers: *Textile mill wastes, Textile chemicals.

A study was made by the Rhode Island Sectional Stream Pollution Committee to make available BOD data on textile chemicals and dyes. The 5-day BOD's of 154 chemicals are given. Long-term BOD should be determined on chemicals with low 5-day BOD. By using low-BOD chemicals whenever possible, stream pollution is greatly reduced. However, some chemicals with a low BOD have other objectionable qualitites. High BOD per se does not eliminate a chemical from use as cost and efficiency must be considered. Large quantitites of low-BOD detergents may result in commulative detergent pollution. (Lonon-North Carolina State)

DETERGENTS - TODAY AND TOMORROW,
Gardinol Chemical Co.
Peter H. A. Strasser.
Textile Journal of Australia, Vol 40, No 5, p 12-13, 38, 41-43, May, 1965. 6 fig.

Descriptors: *Biodegradation, *Detergents, Sewage treatment, Water pollution.
Identifiers: *Textile mill wastes, Wool, Wool scouring.

The problem of biodegradability has stimulated a large amount of research in the detergent industry. The detergents now used are degraded about 60 percent in 24 hours in a sewage treatment plant. However, some authorities feel degradability should be at least 80 percent in 24 hours. As most of Australia's large centers of population have water sources independent of long rivers, the detergent-pollution problem is not very great there. The history of and research in detergents, particularly as related to wool scouring, is discussed at some length. (Lonon-North Carolina State)
W70-08737

BIODEGRADABLE DETERGENTS - SOFT DETERGENTS,
Hart Chemical Ltd., Guelph (Ontario).
H. Zimmerman.
Canadian Textile Journal, Vol. 82, p 43-45, January 22, 1965. 3 fig.

Descriptors: *Alkylbenzene sulfonates, *Biodegradation, Detergents, Water pollution, Waste waters, Biochemical oxygen demand, Fish, Algae, Foaming, Sewage treatment.
Identifiers: *Textile mill wastes, Alfol alcohols.

The alkyl aryl sulphonates are non-biodegradable, whereas soaps, the fatty alcohol sulphates and other fat based detergents, are readily biodegradable. These biodegradable synthetic detergents are available, but their use does not solve the over-all problems of water pollution. Nearly all waste waters from textile operations have a high BOD which affects fish life. The degradation of an alkyl aryl sulphonate in a sewage treatment process is only about 50 percent, and in river water is only about 75 percent in 30 days. The chemistry of alkyl benzene sulphonates (ABS) and the alfol alcohol process is discussed. The major nuisances from ABS residues are foaming and algal growths. There is little evidence that ABS residues are toxic to humans or fish, but the foaming adversely affects sewage treatment. (Lonon-North CarolinaState)

EFFLUENT CHARGES AND THE INDUSTRIAL WATER POLLUTION PROBLEM,
Albert E. Grady.
New Eng L Rev, Vol 5, p 61-27, 1969. 34 ref.

Descriptors: *Water pollution, *Pollution abatement, *Industrial wastes, *Water pollution control, Water pollution treatment, Effluents, Riparian rights, Public health, Taxes, Costs, Operating costs, Industrial wastes, Water quality, Standards, Water Quality Act, Legislation, State governments, Federal government, Legal aspects, Political aspects, Administrative agencies, Industries.
Identifiers: *Effluent charges.

Pollution has become an extremely serious and perplexing problem in the United States. The major contributors to pollution are government and industry. As industry established itself in the last century, pollution was actually encouraged by the creation of a right to reasonable pollution under riparian law and by the balancing-of-equities doctrine. Courts can no longer act as the vehicle for controlling pollution; legislative action is the only feasible alternative. The basic question to be answered is who will pay for pollution abatement--taxpayers or industry. It is apparent that both will have to contribute to the cost of abatement. Tax incentives appeal to industry and can provide a method of inducing installation of abatement facilities. However, there is no way to insure the quality of the investment for the efficiency of its operations. A highly recommended method is for states to set stream quality standards and to place effluent charges upon any industrial wastes which exceed the predetermined permissible levels. All industries will thereby be made answerable for their pollution and will be treated equally and fairly. (Hubener-Florida)

THE USE OF DIGITAL SYSTEMS MODELING IN THE EVALUATION OF REGIONAL WATER QUALITY INVOLVING SINGLE OR MULTIPLE RELEASES,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
R. T. Jaske.
Battelle Memorial Institute, BNWL-SA-1372, August, 1967. 10 fig, 1 tab, 9 ref.

Descriptors: *Model studies, *Turbulent flow, *Computer programs, Theoretical analysis, Water temperature, On-site data collections, Mathematical models, Channel flow, Grand Coulee dam, Density currents, Columbia River, Weather data.
Identifiers: *Transport model, Bowen ratio, Interfacial mass exchange.

In 1963, a digital simulation model was started with the objective of modeling various streams. The major emphasis on the improved transport model was for it to be general enough for application to any turbulent stream. As a result, the development of a digital simulation system based on theoretical

channel flow has been successfully accomplished and used in a variety of cases involving widely divergent input variables. For example, river temperatures in existing systems have been successfully modeled to within 0.25C over a six month period. Moreover, the resulting transport model is suitable for preliminary studies of effluent dispersion for emergency planning or in cases where little or no actual field data exist. Even the Bowen ratio can be continuously varied and the results compared with field data as a means of determining the validity of related concepts. Comparison can readily be made among comparative mathematical models governing varying interfacial mass exchange expressions as a means of determining the relative error introduced or the degree of accuracy required for individual parametric measurements. A hypothetical example is shown for the Illinois River. (Osborne-Vanderbilt)

THERMAL LOADING IN DUNKIRK HARBOR,
State Univ. Coll., Fredonia, N.Y.
Ruth E. Braun, and John A. Jones.
Lake Erie Environmental Studies, Technical Report No. 5, April 1970. 12 p, 6 fig.

Descriptors: *Thermal pollution, *Water temperature, *Heat, Water circulation, Powerplants, Warm-water fishing, Seasonal, Surfaces, Volume, Harbors, Lake Erie, Winds, Eddies, Isotherms, Conductivity, Reservoir evaporation.
Identifiers: *Temperature anomalies, Thermistor, Relative humidity.

Thermal loading due to warmed effluents from a power plant located on Dunkirk harbor has been investigated over a 14-month period. Temperature anomalies of more than 3C were found to exist in the harbor year-round. Greatest anomalies occurred in March, smallest anomalies in April. The harbor basin was noted to be capable of dissipating the heat added by the power plant. Little effect could be found outside the confines of the harbor. No serious detrimental effects due to thermal loading have been demonstrated. As far as the residents of Dunkirk are concerned, the heat which the power plant releases is more beneficial than harmful. Fishing is good year-round and boats can remain in the water over the winter. Since the harbor basin is capable of dissipating the added heat under present conditions, the ratio of heat added to the surface area or volume of the harbor is considered favorable. Any project which might change the size of circulation pattern in the basin should be carefully considered in light of the effects it might have on the characteristics of thermal dissipation of the harbor. DISPOSAL OF SOLID AND SEMI-SOLID TOXIC WASTES,
Hertfordshire County Council (England).
J. L. Stringer.
Water Pollution Control, Vol 69, No 3, p 321-333, 1970. 3 ref

Descriptors: *Disposal, *Industrial wastes, *Solid wastes, *Toxicity, Liquid wastes

A discussion is given of refuse disposal methods in Hertfordshire, an area rich in sand and gravel operations. Methods of disposal include: pretreatment, dumping, incineration, salvage, and sea disposal. Many conflicting interests are involved in the disposal of toxic wastes, including: industry, waste removal contractors, river authorities and water undertakings, sewerage authorities, and public health and planning interests. Most disposal problems have arisen from the handling and dumping of putrescible materials. Depending on the geological conditions and the nearness of wells, the water interests often require protection of the underlying chalk with varying thicknesses of inert material. Risks from dumping of toxic materials vary with the location of the site in relation to wells, the nature of the underground strata and the character of the material. Natural or physical processes reduce the risk, such as when an acid waste is disposed of on chalk. Ion exchange operates in some subsoils, notably clay, while bacteria break down complex molecules and change the chemical properties of some substances. (Aguirre-Texas)

PHYSIOGRAPHY-LAND USE INTERACTIONS IN WATERSHED MANAGEMENT,
British Columbia Univ., Vancouver. Dept. of Forestry.
H. Olav Slaymaker, and Walter W. Jeffrey.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 170-181, 1969. 60 ref.

Descriptors: *Geomorphology, *Land management, *Water yield improvement, *Water quality control, Land use, Topography, Drainage patterns (Geologic), Sediment yield, Overland flow, Watershed management, Erosion, Infiltration, Forest management.
Identifiers: Physiography management.

A distinctive characteristic of some physiographic factors and all land use practices which influence hydrologic response is that they can be manipulated over relatively short time periods. Moreover, physiographic and land use parameters interact so as to produce distinctive hydrologic responses. Those physiographic parameters which cannot be manipulated over the short time period are also of interest insofar as they represent the end-product of long-continued operation of physiography-land use interactions. Length of overland flow, drainage density and hydraulic geometry are variables which can be manipulated; relief ratio, maximum valley side slope and drainage basin area are examples of significant geomorphic parameters which are effectively impossible to manipulate. The parts played by surface resistance to erosion and infiltration capacity in a variety of physiography-land use situations are considered. (See also W70-08597)

**DETERMINATION OF THE POLLUTIONA
EFFECT OF SURFACE RUNOFF,**
Ministry of Land Reclamation and Wat
Economics, Minsk (USSR). Inst. of Wat
Problems.
N. A. Pravoshinsky, and P. D. Gatillo.

In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 187-195, 1969. 9 p, 3 fig, 1 tab, 27 ref.

Descriptors: *Water pollution sources, *Cities, *Storm runoff, *Surface runoff, *Urbanization, Water pollution effects, Biochemical oxygen demand, Dissolved solids, Bacteria, Oil wastes, Foreign research.
Identifiers: *USSR, Minsk.

Pollution by urban surface runoff depends on the intensity of movement of street traffic and use by pedestrians, type of cover of catchment, duration and intensity of rain, standards of water discharge of watering and washing, the amount of dust deposition, the elevation of the catchment water basin, duration of preceding dry weather period, quality and technology of town cleaning, and the means of dust control. Data were compiled from samples collected in the well-built-up districts of Minsk, USSR remote from big industrial interprises and Soligorsk, a rapidly developing town. The value of 5-day BOD was used as a primary index of runoff pollution. In addition, the concentrations of suspended solids, chlorides, oil-products, and bacterial pollution were determined. (Woodard-USGS)

THE INFLUENCE OF SUSPENDED SOLIDS ON THE RATE OF OXYGEN TRANSFER IN AQUEOUS SOLUTIONS,
Technische Hogeschool, Delft (Netherlands). Dept. of Sanitary Engineering.
G. T. M. Van der Kroon.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, Apr 21-25, 1969: London, Pergamon Press, Ltd, p 219-229, 1969. 11 p, 11 ref, append.

Descriptors: *Dissolved oxygen, *Oxygenation, *Suspension, *Aqueous solutions, Suspended load, Oxygen, Water pollution, Test procedures, Laboratory equipment, Equations, Reaeration, Oxygen demand, Water pollution effects.
Identifiers: Oxygen transfer.

An experimental study was made of the rate of oxygen transfer in artificial mixed liquor samples from a bench scale pilot plant, as well as in suspensions of aluminium hydroxide. Oxygen, absorbed from dispersed air, was continuously replenished by injection of pure oxygen gas into the measuring system. Oxygen sensors were used to determine D. O. -contents of the liquid phase and partial oxygen pressures in the gaseous phase. Because research was primarily on the role of flocculant particles, different operating conditions including rate of gas flow, size of the dispersion device and temperature were held constant. The drop of the oxygen saturation value in a mixed liquor and a suspension of aluminium hydroxide is less than 5%. The rate of oxygen transfer in both suspensions depends upon the concentration of the suspended solids, and decreases when the suspended solids concentration increases. The rate of drop appears to depend on the quality of the suspended flocs. The rate of oxygen transfer in a mixed liquor is independent of the rate of respiration. (Woodard-USGS)

PRELIMINARY OBSERVATIONS ON RESPONSE OF YOUNG ONES OF CHINESE CARPS TO VARIOUS PHYSICO-CHEMICAL FACTORS OF WATER,
Fisheries Research Station, Cuttack (India).
S. B. Singh, S. C. Banerjee, and P. C. Chakrabarti.
Proceedings of the National Academy of Sciences, India, Vol 37 (B), No 111, p 320-324, 1967. 1 tab, 4 ref.

Descriptors: *Carp, Bioassay, *Fish stocking, Fish management, Fish establishment, *Fish behavior, Fish physiology, Water temperature, Mortality, Fishkill, *Water quality, Salinity, Turbidity, Hydrogen ion concentration, Laboratory experiments, Dissolved oxygen, Alkalinity, Ammonia, Sulfides, Water chemistry.
Identifiers: India, *Chinese grass carp, *Silver carp, *Tolerance.

Chinese grass carp and silver carp are being introduced into various parts of India. Laboratory experiments were conducted to study the response and reaction of the young chinese and silver carps to wide fluctuations in water temperature, turbidity, pH, dissolved oxygen, total alkalinity, salinity, free ammonia, chlorine, and sulfide which may occur in the different habitats where the fish were introduced. Tolerance limits for both carp species to the water quality parameters are given. The authors concluded that the grass carp were able to withstand slightly greater fluctuations than were the silver carp. (Sjolseth-Washington)

COHO SALMON MORTALITY AND DDT IN LAKE MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
Howard E. Johnson, and Charles Pecor.
Thirty-Fourth North American Wildlife Conference Transactions, p 159-166, 1969. 2 tab, 19 ref. FWPCA Training Grant 5T1-WP-109.

Descriptors: *DDT, Chlorinated hydrocarbon pesticides, Pesticide toxicity, Pesticide residues, *Mortality, *Lake Michigan, Eggs, Lake Superior.
Identifiers: *Coho salmon, DDD, DDE, *Fry mortality.

Investigations were initiated in 1967 to identify and quantity pesticide residues in coho salmon eggs in Lake Michigan and to determine their effects on the hatching fry. DDT concentrations in Lake Michigan coho salmon eggs were three to five times higher than in those from Lake Superior and approximately 60 times higher than in eggs from Oregon. A mortality syndrome, characterized by an abrupt appearance of symptoms during the last stage of yolk sac absorption, was observed in all groups from Lake Michigan. No evidence of the symptoms was observed in Lake Superior and Oregon groups. Higher residues in the eggs of Lake Michigan salmon were, in general, associated with higher mortalities of the fry. DDT concentrations in the last fractions of yolk present in the gut when symptoms first appeared were 6 to 12 times higher than in the body tissues. The absorption of relatively high concentrations of DDT from the gut is suggested as an explanation for the mortality of the coho salmon fry. (Sjolseth-Washington)

EXPERIMENTAL USE OF CHLORDANE IN FISHERY MANAGEMENT,
Bihar Univ., Buzaffarpur (India). Dept. of Zoology.
S. K. Konar.
The Progressive Fish-Culturist, Vol 30, No 2, p 96-99, 1968. 5 ref, 3 tab.

Descriptors: *Fish management, Fish control agents, Fish toxins, Pesticide toxicity, Chlorinated hydrocarbon pesticides, Aquatic insects, Catfishes, *Bioassays, *Lethal limit, Daphnia, Fish food organisms, Fish behavior, Phytoplankton, Zooplankton, Fish physiology, Resistance.
Identifiers: *Chlordane, Labeo rohita, Residual toxicity.

Chlordane is highly toxic but not selective to fish and insects. The LD (0), LD (50), and LD (100) of chlordane to 9 species of freshwater fish and to 9 species of aquatic insects are given. Aquatic insects were more resistant than the fish. Generally, the fishes seemed to be more susceptible to the chlordane than most of the zooplankters. The prolonged residual toxicity of chlordane makes it unsuitable for fishery management. The author feels that on the basis of the present results, that chlordane should not be used in pest-control operations in fields adjacent to fishery reservoirs. (Sjolseth-Washington)

DDVP AS A SELECTIVE TOXICANT FOR THE CONTROL OF FISHES AND INSECTS,
Bihar Univ., Buzaffarpur (India). Dept. of Zoology.
U. S. Srivastava, and S. K. Konar.
The Progressive Fish-Culturist, Vol 28, No 4, p 235-238, 1966. 4 ref, 3 tab.

Descriptors: Carp, Pesticide toxicity, *Bioassay, Mortality, Fishkill, Aquatic insects, Lethal limit, Resistance, Fish management, *Fish control agents, Eels, Fish toxins, Predation, Fish farming, Insect control.
Identifiers: *DDVP, *Selective toxicant, *Residual toxicity.

The nonpersistent insecticide DDVP is a selective toxicant that shows promise as a control for predaceous insects and fishes and for competitor fishes in pond culture of carp, Labeo rohita, in India. The authors find DDVP toxic to fish; but the lethal doses for all the 11 fish species tested are much higher than the lethal doses for insects (6 species tested). The residual toxicity of 20 ppm DDVP is about 3 weeks at a temperature range of 44 deg to 77 deg F without the use of any detoxifying substance. This seems to be much shorter than the residual toxicity of most other chemicals tried. (Sjolseth-Washington)
W70-08649

TETRACHLORO-o-BENZOQUINONE AS A COMPONENT IN BLEACHED KRAFT CHLORINATION EFFLUENT TOXIC TO YOUNG SALMON,
Ontario Research Foundation, Toronto; and Fraser Companies Ltd., Edmundston (New Brunswick).
B. S. Das, S. G. Reid, J. L. Betts, and K. Patrick.
J Fish Res Bd Canada, Vol 26, p 3055-3067, 1969. 2 tab, 2 fig, 19 ref.

Descriptors: *Atlantic salmon, *Bioassay, *Pulp wastes, Stability, Water pollution effects, *Toxicity, Fish toxins, Waste identification, Analytical techniques, Mortality, Chemical analysis.
Identifiers: *Tetrachloro-benzoquinone, *Bleached Kraft effluent, Tetrachlorocatechol.

Evidence is given that tetrachloro-benzoquinone is involved in the toxicity of bleached kraft chlorination effluent (BKCE) to young Atlantic salmon, Salmo salar. The main experimental support was isolation of tetrachlorocatechol from whole BKCE and from a BKCE fraction toxic to salmon, after reduction of both with sodium borohydride. Tetrachloro-o-benzoquinone was shown to be toxic to salmon at low concentrations. Instability of the toxic component in BKCE and substantial loss of toxicity upon treatment of BKCE with sulfur dioxide agreed with the properties of tetrachloro-o-benzoquinone in water solution. (Sjolseth-Washington)

HEAT TOLERANCE OF ALBINO VS. NORMAL CHANNEL CATFISH ICTALURUS PUNCTATUS,
Louisiana State Univ., Baton Rouge. Dept. of Forestry and Wildlife Management.
Kenneth O. Allen.
Proceedings of the 22nd Annual Conference of the Southeastern Association of Game and Fish Commissioners, 1968, 1970. 4 p, 1 tab, 12 ref.

Descriptors: Catfishes, Channel catfish, Acclimatization, *Heat resistance, Heated water, Thermal pollution, *Thermal stress, Resistance, Pigments, Fishkill, Mortality, Water pollution effects, Fish physiology.

Identifiers: *Ictalurus punctatus, *Thermal tolerance survival, *Lethal effects, Albino catfish, *Pigmentation.

Two lots of the Arkansas strain of channel catfish, Ictalurus punctatus, containing both albino and normal fish, were acclimated in the laboratory at a constant temperature of 30.0 deg C. Samples of albino and normal fish were exposed to a lethal temperature of 39.0 deg C. The albinos from both lots had the highest mean survival time, but the differences were not statistically significant. (Sjolseth-Washington)

METABOLISM OF LINDANE BY UNICELLULAR ALGAE,
State University Coll., Buffalo, N.Y. Great Lakes Lab.
Robert A. Sweeney.
Proceedings of the 12th Conference on Great Lakes Research, p 98-102, 1969. 3 fig, 18 ref. USPHS Grant IT-WP-3901-A.

Descriptors: Pesticide residues, Algae, Great Lakes, Metabolism, *Chlorella, *Chlamydomonas Laboratory tests, Gas chromatography, Degradation, Water pollution effects, Aquatic environment, Chlorinated hydrocarbon pesticides, Plant physiology.
Identifiers: *Lindane, *Algae metabolism, Detoxification, Lindane metabolism.

Lindane is an insecticide that has been detected in the Great Lakes Basin. The metabolism of this pesticide by Chlorella vulgaris and Chlamydomonas reinhardtii in axenic culture was ascertained. Each species was cultured in a solution initially containing 4.5, 2.3, or 0.0 ppm lindane. Using chromatographic techniques, a marked decrease in the lindane concentration with time was noted. A substance was observed in extractions of the solutions containing algae and lindane which was not present in extracts from either algae-free cultures containing lindane or from algae in a lindane-free medium. This substance was identified as 1, 3, 4, 5, 6 --pentachloro-cyclohex-l-ene, a non-toxic lindane metabolite. This indicated that Chlorella and Chlamydomonas can metabolize lindane. It also may explain in part the relatively low concentration of this pesticide in the Great Lakes. (Sjolseth-Washington)

SUCCESSION IN ALGAL MAT COMMUNITIES AT THREE NUTRIENT LEVELS,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
Jerry L. Wilhm, and Joseph Long.
Ecology, Vol 50, No 4, p 645-652, 1969. 9 fig, 5 tab, 15 ref.

Descriptors: *Biological communities, *Succession, *Nutrients, Phosphates, Nitrates, Biomass, Pigments, Productivity, Respiration, Ecosystems, Chlorophyll, Chemical properties, Hydrogen ion concentration, Carbon dioxide, Scenedesmus, Bacteria, Protozoa, Rotifers.
Identifiers: *Algal mats, Mougeotia, Anabaena, Oscillatoria, Phormidium, Production-respiration ratio, Production-biomass ratio, Production-chlorophyll ratio.

Ecosystems tend to evolve to a steady state in which net primary production and respiration are balanced and the quantity of biomass constant. It is thought that during succession net primary production decreases at a greater rate than biomass increases and that the ratio between these two variables may be used as indicator of the succession state. Effect of three different levels of phosphates and nitrates on temporal variation of structural and functional parameters was studied in algal mat communities in microcosms, using 1 liter of farm pond water. Most common producers were Mougeotia, Phormidium, and Anabaena. Microcosms receiving the largest input of nutrients were highest in biomass and pigments, but no greater in net production and respiration than microecosystems receiving an intermediate level of nutrients. These four variables remained low in systems receiving the lowest nutrient levels. The ratio of production to respiration approached unity at all nutrient levels. Production/biomass and production/chlorophyll, that is, assimilation number ratios, generally decreased with time and leveled off at all nutrient levels. No effects on the pigment diversity ratio, D-430/D-665 attributable to nutrients were observed. (Jones-Wisconsin)

EFFECTS OF ORGANIC WASTES ON RIVERS,
Water Pollution Research Lab., Stevenage (England).
E. J. C. Curtis, and D. W. Harrington.
Process Biochemistry, Vol 5, No 4, p 44-46, 62, 1970. 3 fig, 3 tab, 14 ref.

Descriptors: *Water pollution effects, *Rivers, *Organic wastes, Effluents, Biological treatment, Biochemical oxygen demand, Bioindicators, Sewage bacteria, Biodegradation, Microorganisms, Water pollution sources, Benthic fauna, Water pollution control, Sewage effluents, Industrial wastes, Slime, Dissolved oxygen.
Identifiers: Filamentous microorganisms, Sewage fungus, Soluble organics, Biotic index, Saprobien system, Portable channels, England.

Effluents containing excessive amounts of organic material produce unfavorable conditions for organisms by direct toxicity or excessive growth of heterotrophic organisms depleting oxygen supplies. Diversity from normal water communities indicates severity of pollution. Organic pollution produces definable zones of pollution severity below effluent discharge. Inorganic nutrients support growth just before recovery zone. Normal sanitary analysis should be performed in addition to biological indicator systems since biological community structure depends on several factors. Filamentous or colonial microorganisms form attached slimes called 'sewage fungus', stimulated by a variety of organic effluents. They are major causes of oxygen depletion and are aesthetically objectionable. Slime production potential of organic effluent is most easily determined by measuring soluble organic content if effluent contains all readily biodegradeable organic compounds. Inorganic nutrients are unlikely to limit slime growth. Removal of organic biodegradable matter from effluents is best done by conventional biological treatment processes. Partial removal has no effect on slime growth. Intermittent discharge of organic effluent controls slime growth by preventing slime build-up. (Bannerman-Wisconsin)

WATER POLLUTION IN REMOTE RECREATIONAL AREAS,
Forest Service (USDA), Duluth, Minn. Superior National Forest.
Michael A. Barton.
Journal of Soil and Water Conservation, Vol 24, No 4, p 132-134, July-August 1969. 4 photo, 1 tab, 7 ref.

Descriptors: *Water pollution, *Recreatio Recreation facilities, Population, Water qualit Monitoring, Nutrients.
Identifiers: Visitor inputs, Natural inputs.

Pollution and/or enrichment of waters in remo recreational areas has generally not proceeded the same extent that it has in more heavily popu lated areas. The lack of concentrated populatio and industries space these areas from the severit of the problem as it exists in urban areas. The sma amounts of pollutants and/or nutrients are muc more noticeable in this high quality water than waters already receiving such inputs. Continue population expansion, increased leisure time an affluence will require that wilderness areas absor greater use. These areas must be protected if the are to survive as an ecological entity. Using stan dards of clean water normally considered ap propriate in water quality control programs, wi derness waters could be degraded significantly be fore uses other than recreation would be damaged Little consideration is given to nutrient enrichmen in formulating standards. Greater emphasis must b accorded to nutrients, and the aquatic growth the produce and the impact of nutrients on aesthet qualities. (Loeb-Rutgers)

THERMAL POLLUTION: THE EFFECT O THE PROBLEM,
La Salle Coll., Philadelphia, Pa.
Charles B. Wurtz.
In: Environmental Problems, edited by Billy Ra Wilson, Philadelphia, L. B. Lippincott Co. 1968, 131-145.

Descriptors: *Thermal pollution, *Pollution con trol, Costs, Temperature changes, Trout, Fishing Cooling, Hydroelectric power, Rivers, Water qual ty, Dissolved oxygen, Metabolism, Correlatio analysis, Productivity, Economic justificatio Benefits, Water law, Investment, Fisheries
Identifiers: *Delaware River, *Metabolic rates.

This paper discusses the effects of artificially in creased water temperatures. One of the greates impediments to controlling thermal pollution is th cost involved. The author discusses the direct rela tion between cost and water quality and gives som examples of the difficulty of deciding which invest ment to make. The paper also discusses the biologi cal effects of increased water temperature. Th author disputes some of the current thinking an analyzes the effect of thermal pollution on dis solved oxygen, and the metabolic rates of living or ganisms. Heat added to the water will increase th productivity of that water, and, in the long run bring higher fish yields. The author concludes wit an analysis of the costs of controlling water pollu tion and argues for realistic goals in control regula tions. (Murphy-Rutgers)

POLLUTION CONTROL: WHY HAS IT FAILED,
Arnold W. Reitze.
American Bar Association Journal, Vol 55, Oct 1969, p 923-927.

Descriptors: *Water pollution effects, *Pollutio abatement, *Air pollution, *Water pollution con trol, Pollutants, Water pollution, Water pollutio sources, Wastes, Soil condemnation, Thermal pol lution, Air pollution effects, Effects, Public health Agricultural chemicals, Fertilizers, Detergents Domestic wastes, Mine wastes, Coordination Federal government, State governments, Adminis trative agencies, Environment, Legislation, Indus tries.

Examining problems that arise with increasing en vironmental pollution, this article contends that to curtail an impending environmental crisis there must be an increasing concern at all levels o society. Various causes, sources, and effects of pol lution are noted. The author calls for three types o

control methods to check pollution. First, there must be a development of public hostility towards pollution. Second, there must be established legal controls and sanctions and a concentrated and centralized effort by federal and state governments to approach the pollution problem. The effectiveness of various agencies are noted, especially the Federal Water Pollution Control Administration; nevertheless, a more centralized effort in the overall area of pollution is called for. Third, the article suggests that economic sacrifice is essential to the fight against pollution. The author notes that any answer to the pollution problem will be costly to government, industry, business, and individuals, but the burden must be accepted. (Snow-Florida)

TOLERANCE OF MYSIS RELICTA TO THERMAL SHOCK AND LIGHT,
Federal Water Pollution Control Administration, Duluth, Minn.
Wesley E. Smith.
Transactions of the American Fisheries Society, Vol 99, No 2, p 418-422, April 1970. 7 fig, 9 ref.

Descriptors: *Water temperature, *Heat resistance, *Ambient light, Resistance, Aquatic animals, Bioassay, Lethal limit, Mortality, Acclimatization, Light, Temperature, Thermal stress.
Identifiers: *Mysis relicta, Thermal shock.

Tests were conducted to determine the thermal tolerance and effects of laboratory illumination on survival of Mysis relicta. Mysids were affected adversely by heat stress when temperatures rose about 10C. When acclimated to a temperature of 7.5C, this species has 96-hour median tolerance limits of 16 to 16.5C. Percent mortality was essentially the same when the animals were subjected immediately to test temperatures, as when temperatures were raised gradually from acclimation temperature over a period of 5 hours. When acclimated to a temperature of 4.5C and then subjected to temperature elevations of 1, 2.5, and 5C per day, 50% of the animals died at 16C in 16 days, 18C in 6 days, and 16C in 4 days, respectively. Mysis relicta is an organism requiring considerable time for effective acclimation. Mysids were intolerant of exposure to normal laboratory illumination. The species lived satisfactorily in light of 10 hours a day for 2 weeks, but this period was followed by a steady mortality of about 8% of the original population per week. (Hsieh-Vanderbilt)

THE CALEFACTION OF A RIVER,
Connecticut Water Resources Commission.
Daniel Merriman.
Scientific American, Vol. 222, No. 5, p 42-52, 10, 148, May 1970. 7 fig, 32 ref.

Descriptors: *Thermal pollution, *Nuclear powerplants, Cooling water, Thermal stratification, Benthic fauna, Fish population, Fish reproduction.
Identifiers: *Calefaction, Thermal block.

An interim report is presented on a survey (1965-1972) on the thermal disturbances of the Connecticut River by heated water from the Connecticut Yankee Haddam Neck's Nuclear powerplant and its biological effects. The location of the water with a higher temperature than normal due to the heated water discharge was given for the seasonal low flow of the river when the river water temperature was at its seasonal high. No thermal block was found. The survey data on the river biology indicate that there has been no significant deleterious effect on the biology of the river though there have been changes in the flora near the plant, in the bottom fauna at the point of effluent discharge and in the condition of the bottom habitat near the plant intake. No significant influence on the river's fish population was found. The catfish entering the cooling water discharge-canal do not fare as well as in the river. (Rietveld-Vanderbilt)

THE ECOLOGY OF FLOWING WATERS IN RELATION TO MANAGEMENT,
Waterloo Univ. (Ontario).
H. B. N. Hynes.
Journal of Water Pollution Control Federation, Vol. 42, No. 3, p 418-424, March 1970. 10 ref.

Descriptors: *Ecology, *Temperature, *Biology, *Fish, *Water quality control, Fungi, Watershed management, Ecosystems, Streams.

Four aspects of the ecology of running water are discussed in relation to the management of watersheds. They are temperature, substratum, the sources of food for invertebrates, and the breeding requirements of fish. It is shown how each may be altered almost inadvertently by man with far-reaching biological effects. These may be deleterious or desirable, but often they are unanticipated by nonbiologists, and even the ecologist cannot claim that he will not meet surprises. A plea is made, therefore, for greater ecological education of watershed managers and much more interdisciplinary consultation in the planning of management programs. We should develop an appreciation of the likely biological consequences of our action and included in our value judgments. (Rietveld-Vanderbilt)

THE RESPONSES OF YOUNG AMERICAN SHAD TO RAPID TEMPERATURE CHANGES,
Essex Marine Lab., Conn.
Sanford A. Moss.
Transaction of the American Fisheries Society, Vol 99, No 2, p 381-384, April 1970. 1 fig, 1 tab, 6 ref.

Descriptors: *Temperature, *Fish behavior, *Migration pattern, *Heated water, Lethal limit, Nuclear powerplants, Cooling water, Fish kill, Thermal pollution, Thermal powerplants.
Identifiers: Shad.

Preliminary experiments indicated that young American shad (Alosa sapidissima) experience rapid mortality when temperatures are quickly raised from an ambient temperature of 24 to 28C up to 32.5C. Temperature increases of this magnitude (Delta T = 5 to 9C) are within the range predicted for portions of the Connecticut River that are affected by the Connecticut Yankee Atomic Power Company cooling water discharge. This study is to learn how young shad behave upon encountering rapidly changing temperatures. Captive juvenile American shad avoided rapid temperature increases of about 4C above acclimatization temperatures in an experimental tank. Responses to rapid temperature changes of about 1.0C were not consistent and did not result in demonstrable avoidances. Young shad are capable of avoiding potentially lethal temperature changes. (Osborne-Vanderbilt)

HEAT AS A POLLUTANT,
General Electric Co., Richland, Wash.
Robert T. Jaske.
Oregon State Univ. Water Resources. Research Institute Water Quality Control Seminar Proceedings, Session 7, p 61-82, November 1964. 10 fig.

Descriptors: *Thermal pollution, *Temperature, Hydrogen ion concentration, Nutrients, Algae, Fish, Stratification, Flocculation, Turbines, Economic efficiency, Heat budget, Social aspects.

The effects of increased temperature on pH, nutrients, algae, taste, and fish are discussed. The advantages and disadvantages of stratification, flocculation, and other variations in the fluid mechanics of streams are considered. A specific example of a typical heat-producing industrial process of a turbine generator plant is examined. The efficiency and the overall plant economy is determined for varying temperatures of the effluent. Problems arising from stream size and the erection of dams and reservoirs are mentioned. Three primary concerns of further research include: (1) improved attention to heat budgets and mathematical treatment of air-water transport phenomena; (2) closer identification of the specific changes associated with the temperature parameter; and (3) improved standardization and methods of economic analysis for identification of the significant economic factors involved. (Osborne-Vanderbilt)

THE EFFECTS OF ELEVATED TEMPERATURE UPON AQUATIC INVERTEBRATES-A REVIEW OF LITERATURE RELATING TO FRESH WATER AND MARINE INVERTEBRATES,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography; and John Hopkins Univ., Baltimore, Md. Dept. of Environmental Engineering Science.
Loren D. Jensen, Robert M. Davies, Arthur S. Brooks, and Caldwell D. Meyers.
Johns Hopkins Univ., Cooling Water Studies, Report No 4, 1969. 232 p, 384 ref, 14 fig, 6 tab.

Descriptors: *Aquatic environment, *Invertebrates, *Temperature, *Thermal stress, *Thermal pollution, Amphipoda, Aquatic insects, Commercial shellfish, Copepods, Crayfish, Crabs, Crustaceans, Insects, Isopods, Lobsters, Mollusks, Mussels, Oysters, Shrimp, Snails, Worms, Aquatic animals, Heated water, Estuaries, Marine animals, Brackish water, Heat resistance, Cold resistance, Fresh water.
Identifiers: Poikilotherms.

Literature directly concerning the effect of elevated temperatures upon both freshwater and marine invertebrates has been reviewed. The review has been limited to major invertebrate groups and does not, because of the lack of published data in some areas, include a uniform treatment of all the groups. The review was written as a source of information for the non-professional biologist. There are three sections. The first introduces the role of temperature in the biology-ecology of the aquatic ecosystem and the effect of temperature on the environment. Section two is an introduction to major invertebrate groups, their morphology and life history, and a review of the published information on the effect of elevated temperatures on the whole animal and the effect on reporduction and development. The third section presents conclusions and interpretations drawn from the published data discussed in sections one and two. (Speakman-Vanderbilt)

RESEARCH IN THERMAL POLLUTION CONTROL,
American Water Resources Association, Urbana, Ill.
Frank H. Rainwater.
Proceedings 4th American Water Resources Conference, Nov. 18-22, 1968. American Water Resources Assn. Urbana, Ill., Ill., 1969. p 140-145.

Descriptors: *Thermal pollution, *Water temperature, Evaporation, Cities, Heat transfer, Mathematical models, Meteorological data, Aquatic life, Cooling, Balance of nature, Economic efficiency.
Identifiers: *Water heat, AEC.

Until recently, Americans have not been aware of thermal pollution and its consequences. Since decisions made today will determine what powerplants go on line six or seven years from now, research is of prime importance. Short-term goals for this research should include: (1) a better understanding of the physics of heat input, transport and dissipation in water resources along with non-empirical,

stochastic, thermal mathematical modeling; (2) a better knowledge of the effects of aquatic biota and identification of species having special ecological and economic importance; and (3) increased thermal efficiency and water consumption of cooling devices. Long-term goals should include research results leading to practical power generation by advanced techniques, energy cycles that reject substantially less heat to the environment, and a management approach involving the whole concept of energy utilization. However, the ultimate success in thermal pollution control depends on the regulatory agency, the polluter, and the user of water doing his part, research being done on priority items, and emphasis focused on how to prevent and abate thermal pollution - not on how to justify it. (Osborne-Vanderbilt)
W70-08840

WATER QUALITY AND THE MIGRATION OF FALL SALMON IN THE LOWER WILLAMETTE RIVER,
Oregon Fish Commission, Astoria.
Roy E. Sams, and Kelly R. Conover.
Final Report, May, 1969. 58 p, 23 fig, 22 tab.

Descriptors: Water pollution effects, Chinook salmon, *Water quality, *Water temperature, *Fish migration, *Dissolved oxygen, Water levels, Oregon, Columbia River, Time of Concentration, Streamflow, Impaired water quality, Fish management, Fish barriers, Anadromous fish.
Identifiers: Coho salmon, *Willamette River.

Water quality and salmon migration data for the lower Willamette River were collected and analyzed to determine if water quality affected the migration of salmon. Some of the more important conclusions are: (1) Columbia River Coho salmon occur over a wide period of time, usually peaking in late October; (2) Chinook begin in early September; (3) Initial passage of chinook and coho over Willamette Falls was not preceded by a significant increase or decrease in streamflow; (4) At times low tides may have restricted passage over the falls; (5) 73 deg F water in the Willamette has not blocked fish from entering the river and (6) no salmon were observed passing over Willamette Falls until the D.O. level rose to 5 ppm or above. (Sjolseth-Washington)

SEAFOODS PROCESSING: POLLUTION PROBLEMS AND GUIDELINES FOR IMPROVEMENT,
Oregon State Univ., Corvallis. Dept. of Food Science and Technology.
M. R. Soderquist, K. J. Williamson, and G. I. Blanton.
Proceedings of the National Symposium on Food Processing Wastes, Apr 6 - 8, 1970, Portland, Oregon. p 189-225, 65 ref, 8 tab, 7 fig. FWQA Grant 12060 ECF.

Descriptors: *Water pollution sources, Water pollution effects, *Water pollution control, Pollution abatement, Marine fisheries, Herrings, *Waste disposal, Research and development, Bottom fish, Crabs, Salmon, Canneries, Commercial fishing, Shrimp, Byproducts, On-site investigations, *Waste water treatment, Industrial wastes.
Identifiers: Menhaden, *Seafood processing, Tuna processing, Waste characteristics, Canning, Byproduct recovery.

The processing is discussed of the major United States seafoods species, the resultant waste water strengths and flows, solid wastes magnitudes, current treatment and by-product recovery methods, and current and recommended research in water pollution abatement. The paper was based on a comprehensive literature review and extensive on-site investigations of current research, processing, and treatment activities in the major seafoods centers of the U. S. (Sjolseth-Washington)
W70-08921

THE EFFECT OF TEMPERATURE ON THE RATE OF DEVELOPMENT AND SURVIVAL OF ALEWIFE EGGS AND LARVAE,
Bureau of Commercial Fisheries, Ann Arbor, Mich. Great Lakes Fishery Lab.
Thomas A. Edsall.
Trans Amer Fish Soc, Vol 99, No 2, p 376-380, 1970. 12 ref, 4 fig.

Descriptors: Lake Michigan, *Water temperature, Water pollution effects, Mortality, Fishkill, Fish eggs, *Hatching, *Viability, Incubation, Larval growth stage.
Identifiers: *Alewives, Water temperature effects, Development rate, Survival, *Egg mortality, *Hatching success, *Incubation time.

Eggs from Lake Michigan alewives (Alosa pseudoharengus) were incubated at 79 different temperatures from 42.1 to 87.0 F. Hatching occurred at 44.4--84.9 F and was optimum (38% hatched) at about 64 F. Incubation time varied from 15 days at 45 F to 3.7 days at 70 F and 2.1 days at 84 F. Time from start to finish of hatching ranged from 13 days at about 46 F to 2-3 days at 68-70 F and 1-2 days at 80-84 F. Survival of unfed larvae held at incubation temperatures increased from 3.8 days at 51 F to 7.6 days at 58-59 F and then decreased to 2.4 days at 80-82 F. (Sjolseth-Washington)
W70-08922

PESTICIDE MONITORING OF THE AQUATIC BIOTA AT THE TULE LAKE NATIONAL WILDLIFE REFUGE,
Federal Water Quality Administration, Klamath Falls, Oreg.
Patrick J. Godsil, and William C. Johnson.
Pesticides Monitoring Journal, Vol 1, No 4, p 21-26, 1968. 8 ref, 5 tab, 4 fig.

Descriptors: *Chlorinated hydrocarbon pesticides, DDT, Endrin, *Pesticide residues, Pesticide toxicity, Water pollution effects, *Monitoring, *Water quality, Aquatic environment, On-site data collections, On-site investigations, Clams, Water birds, Bass, Mortality, Bottom sediments, Aquatic plants, Oregon, California.
Identifiers: DDD, DDE, Chlordane, *Water quality monitoring, *Pesticide monitoring, Tule Lake (Calif), Lower Klamath Lake (Calif), Lost River (Oregon).

Over a 2-year period, samples of water, suspended material, submerged aquatic plants, clams, and fish were collected from the Tule Lake area and analyzed for chlorinated hydrocarbon pesticides. Compounds DDE, DDD, DDT, chlordane, and endrin were found regularly in samples of both water and biota. Water contained a maximum of 0.100 ppb of endrin in 1965, while tui chubs accumulated a maximum of 198 ppb during the same year. Concentrations of endrin in the other strata of the biota were distributed between these extremes of the food chain. The occurrence of endrin was directly associated with contaminated irrigation return water supplying the Refuge lakes. As the concentrations of studied pesticides increased in the drainage water, the biota also became contaminated. However, at the end of the season, as the concentrations decreased in the water, the biota was cleaned. Concentrations in both water and biota returned to or near analytical sensitivity (water--0.007 ppb; biota--4 ppb) between growing seasons. (Sjolseth-Washington)
W70-08923

OCCURRENCE OF PESTICIDES IN WHALES,
Bureau of Commercial Fisheries, Seattle, Wash.
Allen A. Wolman, and Alfred J. Wilson, Jr.
Pesticides Monitoring Journal, Vol 4, No 1, p 8-10, 1970. 2 tab, 16 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *DDT, *Dieldrin, Pesticide residues, Analytical techniques, Endrin, Aldrin, Gas chromatography.
Identifiers: *Gray whales, *Sperm whales, *Tissue samples, Brain tissues, Liver tissues, Blubber tissues, Tissue analysis, DDE, DDD, Toxaphene, Heptachlor epoxide, Polychlorinated Biphenyls, Methoxychlor.

Organochlorine pesticides were found in tissue samples of brain, blubber, and liver from 6 of 2 gray whales, Eschrichtius robustus, and in each of sperm whales, Physeter catodon, collected near San Francisco, Calif., in 1968 and 1969. Concentrations of DDT or its metabolities ranged up to 0.36 ppm in blubber tissue of gray whales, and 6. ppm in blubber tissue of sperm whales. The higher dieldrin concentrations were 0.075 ppm in gray and 0.019 ppm in sperm whales. (Sjolseth-Washington)

HISTOLOGICAL AND ELECTRON MICROSCOPICAL OBSERVATIONS ON COPPER POISONING IN THE WINTER FLOUNDER (Pseudopleuronectes americanus).
McGill Univ., Montreal (Quebec). Marine Sciences Centre.
Jeremy T. P. Baker.
J. Fish. Res. Board Canada 26: 2785-2793, 1969. 25 ref, 19 fig.

Descriptors: *Copper, Copper sulfate, Heavy metals, Water pollution effects, *Fish physiology, Fishkill, Mortality, *Toxicity, Electron microscopy, *Microscopy.
Identifiers: Winter flounder, *Pseudopleuronectes americanus, *Histology, Gill Lamellae.

Effects of high (3200 microgram/liter Cu (++)) medium, (560-1000) and low levels (180 microgram/liter Cu (++)) of copper on the morphology of winter flounder were investigated. High and medium levels resulted in fatty metamorphosis in the liver, necrosis in the kidney, destruction of the hemopoetic tissue, and gross changes in gill architecture. Light microscope studies showed that low levels of copper caused an extracted appearance in gill lamellae; the epithelial layer appeared vacuolated; the basi-lamellar region was reduced in thickness. Lamellar mucus cells were few compared with control specimens and chloride cells appeared in their stead. Electron microscope study of gill lamella from fish exposed to low levels of copper confirmed vacuolation in the epithelial layer. Also found were myelinlike figures, various membrane-bound vesicles, and apical homogene-

ous layers of reduced thickness. Increased amounts of particulate matter adhering to the external surface of the epithelial cells were apparent. Chloride cells were found instead of mucus cells. (Sjolseth-Washington)

SURVIVAL AND GROWTH OF LARVAE OF THE EUROPEAN OYSTER (OSTREA EDULIA L.) AT DIFFERENT TEMPERATURES,
Bureau of Commercial fisheries, Milford, Conn.
Harry c. Davis, and Anthony Calabrese.
The Biological Bulletin, Vol 136, No 2, p 193-199, April 1969. 2 tab, 1 fig, 9 ref.

Descriptors: Water temperature, Oysters, Growth rates, Larval growth stage, Mortality, Bioassay, Shellfish.
Identifiers: Ostrea edulis, Optimum growth temperature, Survival, Spat.

The temperature range for satisfactory growth of O. edulis larvae (70% or more of optimum) was from 17.5 deg. to 30C. The temperature range for satisfactory survival (70% or more of optimum) was from 12.5 deg. to 27.5C. Even at 10C survival was poor, perhaps, because the unfavorable temperatures weakened the larvae, making them more susceptible to bacterial toxins and diseases. In these experiments approximate setting times were as follows: 17.5C-26 days, 20C-14 days, and at 25 deg. 27.5 deg, and 30C beginning of setting varied from the 8th to the 12th days. More spat were obtained at 20 deg to 22.5C than at higher temperatures. It is suggested that larvae be reared to setting size at temperatures from 25 deg to 27.5C, then kept at 20 deg to 22.5C during setting to obtain fastest growth of larvae and highest percentage setting. Spat kept at 10C showed virtually no growth; at temperatures from 12.5C growth of spat increased with each increase in temperature. (Sjolseth-Washington)
W70-08927

THE pH TOLERANCE OF EMBRYOS AND LARVAE OF MERCENARIA MERCENARIA AND CRASSOSTREA VIRGINICA,
Bureau of Commercial Fisheries, Milford, Conn.
Anthony Calabrese, and Harry C. Davis.
Biological Bulletin, 1966. Vol 131, No 3, p 427-436. 6 tab, 10 ref.

Descriptors: *Hydrogen ion concentration, Clams, Oysters, *Larvae, Larval growth stage, *Embryonic growth stage, Resistance, Mortality, Bioassay, Growth rates.
Identifiers: *pH tolerance, Mercenaria mercenaria, Crassostrea virginica.

The pH range for normal embryonic development of oysters (Crassostrea virginica) was 6.75 to 8.75, and for clams, (Mercenaria mercenaria), 7.00 to 8.75. More than 68% of the larvae of both clams and oysters survived at pH 6.25 to 8.75. The lower pH limit for survival of oyster larvae was 6.00 and for clam larvae, 6.25. The pH range for normal growth was 6.75 to 8.50 for clam larvae and 6.75 to 8.75 for oyster larvae. The rate of growth of both species dropped rapidly at pH levels below 6.75. The optimum pH for growth was 7.50 to 8.00 for clam larvae and 8.25 to 8.50 for oyster larvae. At pH 9.00 to 9.50 the percentage of eggs that developed normally, the percentage of larvae that survived, and the percentage increase in mean length of both species decreased rapidly. (Sjolseth-Washington)

THE CHRONIC TOXICITY OF LINEAR ALKYLATE SULFONATE TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS, RAF.),
Federal Water Pollution Control Administration, Cincinnati, Ohio. Newtown Fish Toxicology Lab.
Quentin H. Pickering, and Thomas O. Thatcher.
Journal of Water Pollution Control Federation, Vol 42, No 2, Part 1, Feb 1970, p 243-254. 8 tab, 28 ref.

Descriptors: Toxicity, Water quality, Detergents, Linear alkylate sulfonates, Effects.
Identifiers: Fish, Chronic toxicity.

A continuous flow bioassay was made for the appraisal of the chronic toxicity of linear alkylate sulfonate (LAS) to the fathead minnow (Pimephales promelas, Rafinesque). The toxicological effect investigated was fish production based on survival, growth, and reproduction. Statistical analysis of the data from newly hatched fry survival indicated a significantly greater mortality at the two high test concentrations. At a concentration of 0.63 mg LAS/1 fish production was similar to the control fish. An application factor obtained by dividing the maximum acceptable toxicant concentration by the 96-hour TLm value was found to be between .14 and .28.

BIOLOGICAL EFFECTS ON SEDIMENT-WATER NUTRIENT INTERCHANGE,
California Univ., Berkeley. Sanitary Engineering Research Lab; and Sunn, Low, Tom, and Hara, Inc., Honolulu, Hawaii.
Donald B. Porcella, James S. Kumagai, and E. Joe Middlebrooks.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 96, No SA4, Paper 7460, p 911-926, August 1970. 5 fig, 8 tab, 10 ref. Contract AT (11-1)-34 - Project 100, AEC.

Descriptors: *Nutrients, *Bottom sediments, *Limnology, *Algae, *Eutrophication, Lakes, Water quality, Phosphorus, Phosphates, Productivity, Leaching.
Identifiers: Sediment-water nutrient-exchange.

Different types of sediments vary in their ability to support algal growth. This is related to the amount of available phosphorus measured in the sediments. Although the amount of phosphorus released from the sediments varied with the type of sediment, all of the available phosphorus eventually should be extracted in the 15-cm layer of sediment studied. The development of a thick mat of Oscillatoria caused an increase in productivity due to the increased transfer of phosphorus from the sediment; and, in general, the more productive systems had sediments containing greater amounts of phosphorus. Also, the equilibration of P-32 with stable phosphate occurred more rapidly in the more productive systems, and this rate of equilibration appeared to be associated with the sediments themselves. Hence P-32 exchange with stable P was related to the concentration of available phosphorus in the system. (Knapp-USGS)

MODIFIED FILTER MEDIA FOR REMOVAL OF WATER POLLUTANTS,
Indian Inst. of Tech., Kanpur. Dept. of Civil Engineering.
G. D. Agrawal, and A. V. S. Prabhakara Rao.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 299-307, 1969. 9 p, 5 fig, 10 ref.

Descriptors: *Water pollution control, *Filtration, *Particle size, *Clays, *Silts, Sands, Algae, Plankton, Microorganisms, Turbidity, Analytical techniques, Laboratory tests, Foreign research.
Identifiers: *Filter media, Alumina-coated sand, Ferric oxide-coated sand, Crushed bauxite, Acid-washed bauxite, Kanpur (India).

Experiments were made to develop a simple filter, with modified media, for efficient removals of micro sized particles, whether used for disposal to exclude particulate pollutants from effluents or for water supply to remove particulate contaminants. Two pyrex glass tubes were used to contain the filter columns. The filter bed for all the runs was a 7.6 cm layer of shingle and coarse sand supporting an 18 cm layer of the media under study. Filter media consisted of untreated sand, sand coated with alumina, sand coated with ferric oxide, crushed low-grade bauxite and bauxite washed with acid. Water with less than 10 mg/l. turbidity could be produced by filtration of raw stream water (influent turbidity 46 mg/l.) or raw pond water (influent turbidity 32 mg/l.) and reduced the total bacterial numbers by about 50%. VISCOSE RAYON FACTORY WASTES AND THEIR TREATMENT,
C. P. Sharda, and K. Manivannan.
Technology (Sindri, India) Spec. Issue, Vol 3, No 4, p 58-60, 1966.

Descriptors: *Sulfides, Neutralization, Alkalinity, Acidity, Trickling filters.
Identifiers: *Viscose rayon, Zinc compounds, Tire cord.

The process of viscose rayon manufacturing is briefly described. The effluents from the factory are classified as alkaline viscose residues, acid sulfide, and sanitary. The combined waste treatment may be difficult and sep. treatment is recommended. The process adopted includes neutralization and settlement, incineration, neutralization with lime or limestone and trickling filter. The addnl. problem of removal of zinc compounds from viscose tire cord plant residues is mentioned. (Livengood-North Carolina State)

FLOCCULATION AND DEFLOCCULATION OF AN AQUEOUS SUSPENSION OF CHLORELLA,
Tokyo Univ. (Japan). Inst. of Applied Microbiology.
Shuichi Aiba, Takeshi Watanabe, and Makoto Hirata.
Journal of Fermentation Technology, Vol 48, No 3, p 125-136, 1970. 10 fig, 1 tab, 16 ref.

Descriptors: *Flocculation, *Chlorella, Suspension, Turbidity, Size, Surface tension, Shear stress, Viscosity, Sewage, Industrial wastes, Activated sludge, Cultures, Mathematical studies, Light intensity, Temperature, Sludge.
Identifiers: *Deflocculation, *Aqueous suspensions, Sensor, Cadmium sulfide, Chlorella vulgaris.

Many questions on flocculation and deflocculation of sludge remain to be resolved. The primary purpose of this study was the establishment of a method for assessing the process of microbial flocculation and deflocculation in a generalized fashion, Chlorella being a favorable test organism. A specific sensor of cadmium sulfide was constructed for a continuous assessment of flocculation and/or deflocculation of a dilute and well-dispersed aqueous suspension of Chlorella cells in an agitated vessel. Reading of a millivolt recorder in a circuit of the sensor could readily be converted to the turbidity value; this was correlated fairly well with the mean surface diameter of the floc. The decrease/increase of turbidity of the cell suspension reflected progress of flocculation or deflocculation. Good reversibility, depending on agitation intensity, was confirmed between flocculation and

deflocculation of the cell suspension. Water content of floc in the vessel was also correlated favorably with the ratio of the mean floc size to the cell diameter. The deflocculation was analyzed from a force balance between the pseudosurface tension of the floc and the shear stress due to the liquid viscosity. (Jones-Wisconsin)

MINE WATER TREATMENT--FRICK DISTRICT,
United States Steel Corp., Pittsburgh, Pa.
R. R. Godard.
Mining Congress Journal, Vol 56, No 3, p 36-40, 1970. 4 fig, 6 photos.

Descriptors: *Mine wastes, *Acid mine water, *Coal mine wastes, *Mining, *Mine drainage, Settling basins, Lime, Iron, Alkalinity, Water pollution sources, Water treatment, Waste water treatment, Industrial wastes, Pennsylvania, Sludge disposal, Fertilizers, Productivity.
Identifiers: US Steel Corporation, Frick District (Pa), Mine water treatment.

A short history of US Steel's attempts at pollution abatement since early 1900's is presented. Neutralization of acid mine water with lime was practiced in 1915 and potable water used to quench coke. Treatment problems were similar to those today. Expense of neutralizing treatment was compensated by selling the precipitate as fertilizer and for removing hydrogen sulfide from natural gas. In 1957 settling ponds were built in Frick District to settle ferric iron from alkaline mine water; discharge from the current pond contains less than 7 milligram/liter iron. Maple Creek mine reduced alkalinity of 350-610 milligram/liter to 330-420 milligram/liter by aeration and holding pond system. Treatment of mine waters with pH of 2.9-33, acidity of 500-1600 milligram/liter and iron content of 300-800 milligram/liter from Robena mine resulted in water with pH 7.3-8.5 and total iron content of 2 to 4 milligram/liter, and no acidity. Treatment facility includes 8 million-gallon raw water storage pond, variable speed lime feeder, slurry mixing chambers, aerating basin, and 140 million-gallon settling pond. (Bannerman-Wisconsin)

APPLICATION OF THE DISSOLVED OXYGEN ELECTRODE TO TREATABILITY STUDIES OF INDUSTRIAL WASTES,
Department of Water Resources, Durham, N.C.
Leslie A. Matthews.
Southern Water Resources and Pollution Control Conference, Vol. 13, p 89-96, April 1964. 9 fig, 6 ref.

Descriptors: *Biological treatment, Respiration, Oxygen, Electrodes, Waste waters, North Carolina, Biochemical oxygen demand, Dissolved oxygen.
Identifiers: *Textile mill wastes, *Metal plating wastes, pH.

Industrial wastes can be treated biologically when the wastes are not toxic to the organisms, and proper environmental and nutritional requirements are met. A respiration technique using an oxygen electrode to evaluate the biological treatability of the waste waters does not require pilot plants or extensive time and equipment. This technique is especially useful in determining the effects of unknown wastes on a biological system. Results of studies on metal plating and textile wastes made at Durham, North Carolina, are given. BOD, pH, dissolved oxygen content, and oxygen uptake are emphasized. (Lonon-North Carolina State)

FINDING THE BEST WAY TO TREAT WASTES FROM A BLANKET MILL,
Chatham Mfg. Co., Elkin, N.C.
Arthur L. Smith.
Waste Engineering, Vol. 32, No. 5, p 230-233 and 257, 1961. 9 fig, 1 tab.

Descriptors: *Aeration, Wastes water, Copper compounds, Fibers, Screens, Suspended load, Biochemical oxygen demand, Sludge, Cotton, Sludge digestor, Dissolved oxygen, Order.
Identifiers: *Textile mill wastes, Pilot study, Dyehouse wastes, Blanket mill wastes, Wool grease, Mordant dyes, Antibacterial finishes, Wool, Rayon (Regenerated cellulose fibers), Acrylic fibers, Polyamides, Yadkin River, North Carolina Stream Sanitation Committee, pH.

A four-year pilot study was made dealing solely with development and design of modified aeration techniques. The wastes to be treated included dyehouse wastes, wool grease, chrome dyestuffs, copper fixing agents a bacteriostactic agent, and wool, rayon, cotton, acrylic, and polyamide fibers. The Yadkin River into which these wastes were discharged was classified as a Class C stream by the North Carolina Stream Sanitation Committee. A 60-mesh vibrating screen was used to take out large suspended solids. The wastes were aerated most satisfactorily at a pH of 7.0 to obtain a high removal of BOD. Sludge was picked up by air lifts and taken back to the aeration tank or to the sludge diester. A 3:1 air-to-wastes ratio was found to be the minimum at which the dissolved oxygen content could be maintained at required levels. If needed, the sludge was aerated while in the digestor. Nuisance from odors was created in either the wastes or in the sludge using this method. (Lonon-North Carolina State)

WATER CONSERVATION AND POLLUTION ABATEMENT,
R. Hobart Souther.
American Dyestuff Reporter, Vol. 51, No. 9, p 41-44, April 30, 1962. 2 tab.

Descriptors: *Aeration, Water conservation, Water pollution, Waste treatment, Trickling filters, Activated sludge.
Identifiers: *Textile mill wastes, Biosorption.

The great increase in water usage has brought about an urgent need for more research and trained personnel in water conservation. Research funds for water pollution studies need to be spent on applied research rather than basic research. With todays new methods and equipment, proper waste treatment is not as costly as it once was. Particularly successful in textile waste treatment is the aeration lagoon process. Highly alkaline mill waste waters combined with sewage can be treated in trickling filters combined with activated sludge processes without chemical adjustments. The biosorption process can also be used to increase the capacity of conventional sludge plants. Results and costs of aeration techniques are given. (Lonon-North Carolina State)

BIOLOGICAL TREATMENT OF TEXTILE WASTES,
Weston (Roy F.), Inc., Newton Square, Pa.
Vernon T. Stack, Jr., E. L. Jones, T. A. Alspaugh, and H. B. Stokes.
Purdue University Engineering Extension Series Series No. 109, Vol. 46, No. 2, p 387-422, March 1962. 29 fig, 5 tab, 2 ref.

Descriptors: *Biological Treatment, Waste water North Carolina, Streams, Biochemical oxygen demand, Color, Activated sludge, Aeration, Cotton.
Identifiers: *Textile mill wastes, pH.

Laboratory and pilot studies were made to design biological treatment facilities for the waste water from four textile plants in Greensboro, North Carolina. Three million gallons per day of waste from cotton goods processing are discharged into North Buffalo Creek. This stream is classified a class D stream by the North Carolina stream Sanitation Committee. The wastes are high in BOD, color content, and pH. Satisfactory treatment is accomplished by activated sludge in complete-mixed process. A 98 percent removal of BOD is obtained in warm weather. Wastes are aerated at pH 11.5 without neutralization. This aeration gives an effluent pH of 8.5. Color removal is 80 percent. (Lonon-North Carolina State)

CAUSTIC RECOVERY HELD TO PAY HALF ITS COST IN YEARS,
Allied Chemical Corp., Syracuse, N.Y. Solvay Process Div.
W. R. Steele.
Daily News Record, No. 190, No. 21182, p 41 September 29, 1961.

Descriptors: Water pollution, Surveys.
Identifiers: *Textile mill wastes, *Sodium hydroxide, Recovery (Chemical), Cotton system processing, Dyehouse wastes.

Caustic soda recovery and reutilization procedures in cotton finishing plants result in annual savings exceeding 50 percent of the initial investment. These savings result even though it might be necessary to collect, evaporate, filter, dialyze, re-evaporate, and treat the final wastes. Other beneficial side effects are increased yardage return and alleviation of water and air pollution. All plant officials are urged to have a caustic utilization survey made if considering such a system. (Lonon-North Carolina State)

HOLDING AND AERATION OF COTTON MILL FINISHING WASTE,
North Carolina State Univ., Raleigh.
Nelson L. Nemerow.
Proceedings, 5th Southern Municipal Industrial Waste Conference, Chapel Hill, North Carolina, 1956, p 149-156. 3 tab, 7 ref.

Descriptors: *Cotton, Waste waters, Pilot plant, Model studies, Biochemical oxygen demand, Aeration, Lagoons.
Identifiers: *Textile mill wastes, *Dyehouse wastes, Desizing wastes, Starch, Bleaching, Dyeing, pH, Kiering.

A pilot plant study was made of methods of treating waste water from a textile mill engaged in the processing of cotton fabrics. The wastes intering the effluent were from desizing, kiering, bleaching, and dyeing. The starch from the desizing step is the main source of BOD. (1) Ten hours of holding and 12 hours of aeration with pH control reduced BOD by 71-79 percent. (2) Twenty seven of holding alone reduced BOD by 56 percent and an additional 12 hours of aeration brought this to 75 percent. (3) Three hours of holding and 7 hours of aeration produced a reduction of 49 percent. (4) As holding time was reduced, more CO2 for neutralization was required. (5) With no neutralization and a pH of 11.3 only 39 percent reduction was secured in 10 hours holding and 12 hours of aeration. (6) The pH dropped from 11.3 to 9.9 during aeration. (7) A bacterial count of 5

million was found even in highly alkaline waste water. (WorkeNorth Carolina State)
W70-08739

EFFLUENT PURIFICATION OF A BLEACHING AND DYEING PLANT,
Josef Wittman.
Melliand Textilberichte, Vol. 38, No. 6, p 679-680, June 1957. 3 fig.

Descriptors: *Chemical precipitation, Iron, *Aeration, Industrial wastes.
Identifiers: *Textile mill wastes, Bleaching, Dyeing, Dyestuffs.

The problems of treatment of industrial waste waters is discussed and a process is described for the treatment of waste waters from bleaching and dyeing. The process is based on the use of chemical precipitation by metallic iron in the form of waste filings which are stirred, with aeration, with the waste waters in a concrete-covered tank. (Livengood-North Carolina State)

FOR HOSIERY FINISHERS: WHY BIODEGRADABLE DETERGENTS HELP SOLVE SEWAGE DISPOSAL PROBLEMS,
Harry White.
Hosiery and Underwear, Vol. 49, No. 8, p 56-58 and 64, August, 1966. 2 fig.

Descriptors: *Biodegradation, Biochemical oxygen demand, Waste waters, *Detergents, Biological treatment, Sewage treatment.
Identifiers: *Textile mill wastes, *Hosiery dyeing, Dyehouse wastes.

The BOD, pH, volume, odor, and color determine treatment for the waste waters from hosiery dyehouses. Usually, if the effluents are discharged into a large municipal sewage-disposal system, no problems arise. But, smaller systems may not be able to handle the wastes. A case history in a small southern town is given. Nonionic detergents resist biodegradation . The river die-away test, the shake flask method, and the laboratory schal sewage plant system are three biological test useful in determining biodegradability. Although biodegradable detergents enhance sewage disposal, they do not eliminate all disposal problems. (Lonon-North Carolina State)
W70-08742

WASTE PROBLEMS ASSOCIATED WITH DYEING AND FINISHING OF SYNTHETIC FIBERS,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
S. G. Turnbull, Jr.
Southern Water Resources and Pollution Control Conference, Vol. 5, p 170-178, April 1956. 4 tab, 10 ref.

Descriptors: *Biochemical oxygen demand, Waste waters, Adhesives, Fibers, Phenols, Carriers, Biological treatment, Cotton.
Identifiers: *Textile mill wastes, Starch, Gums, Sizes (Slashing), Dyeing, Warp sizes, Man made fibers, Carrier dyeing, Desizing wastes, Dyehouse wastes.

Starches and gums applied during the yarn slashing stage account for 50 percent of the BOD in waste waters from a conventional cotton finishing plant. The BOD can be significantly reduced by substituting synthetic sizes for natural gums and starches. Waste waters from the dyeing of hydrophilic fibers have BOD values similar to those from wool and cotton dyeing. Phenols must be removed or destroyed to avoid ruining the taste when the water is reused. Carriers used in dyeing hydrophobic fibers present special problems. Bacterial decomposition is recommended to eliminate these phenolic types. The trend in fabric finishing is away from the natural compounds which give high BOD. (Lonon-North Carolina State)
W70-08743

WASTE DISPOSAL: A GROWING HEADACHE,
Irving Teplitz.
Textile Bulletin, Vol. 90, No. 6, p 70-74, June, 1964. 2 fig, 24 ref.

Descriptors: *Waste water disposal, Biological treatment, Waste treatment, Iron compounds, Lime, Trickling filters, Chemical precipitation.
Identifiers: *Textile mill wastes, Chemical treatment, Alum, Ferrous compounds.

The legal aspects of industrial wastes disposal can no longer be ignored. Textile wastes, e.g., floating matter, settleable suspended matter, colloidal impurities, acids and bases, and dyes, must be removed from plant effluents. Biological waste treatment is usually preferred because of cheaper operating costs. Often prevention eliminates the need for waste treatment facilities. Chemical treatment may involve the use of alum, iron or lime, ferrous sulfate and lime, ferric sulfate and lime, chlorinated ferrous sulfate, ferric chloride, ferrous chloride, lime alone, or sulfuric acid and sulfur dioxide. Biological treatment may include lagoons, activated sludge, trickling filters, hi-lo activated sludge, or the Zimmerman Process. Alkyl arylsulfonates, wool grease, and other special wastes present unique problems. (Lonon-North Carolina State)
W70-08744

BIOLOGICAL TREATMENT OF WOOL SPINNERY WASTE,
Fermentation Research Inst.
Masao Tanaka, Michio Dazai, Yorikazu Sonoda, Michiaki Sato, and Itideo Ono.
Kogyo Kagaku Zasshi (Journal of the Chemical Society of Japan, Industrial Chemistry Section) Vol. 67, No. 5, May 1964, p770-776.

Descriptors: *Biological treatment, Methane bacteria, Waste storage, Activated sludge, Waste water, Biochemical oxygen demand, Suspended load.
Identifiers: *Textile mill wastes, *Wool wastes, Dyeing, Wool, Wool grease.

Laboratory and pilot plant tests of wool spinning waste treatment were conducted. The wastes are treated by thermophilic methane fermentation. The digestive fluid from the fermentation step and other wastes are mixed in a lagoon. Then, the effluents are treated by the activated sludge process. BOD, grease content and suspended solid levels are satisfactory after this treatment. (Lonon-North Carolina State)

TEXTILE WASTE TREATMENT: WHAT TO DO ABOUT IT,
Cannon Mills Co., Kannapolis, N.C.
J. L. Brown.
Mechanical Engineering, Vol. 82, No. 6, p100, June 1960.

Descriptors: *Treatment facilities, Domestic wastes.
Identifiers: *Textile mill wastes, Sodium hydroxide, Starch, *Slashing wastes, *Bleaching wastes.

The equipment and techniques used at the Kannapolis, North Carolina mills of Cannon Mills are described. Wastes being treated consist of domestic sewage from the mills and mill village and certain wastes from the bleachery and slasher rooms (chiefly starch) and a 3 percent caustic solution used as a cleaning agents. A two-year study showed that treatment could best be effected if the wastes were segregrated at the bleachery and piped separately to the treatment plant. The starch was treated immediately, while the caustic was treated on a seven-day basis. The following units are used in treatment: a caustic storage lagoon, primary clarifiers, trickling filters, secondary clarifiers, a chlorine contact tank, sludge digesters, and vacuum filtration of sludge. Modifications in the system since its inception to improve efficiency are described. (Dandridge-North Carolina State)
W70-08746

PHYSICOCHEMICAL CHARACTERISTICS OF RESIDUAL WATERS AND TREATMENT EXPERIMENTS AT A COMPLEX TEXTILE MANUFACTURER,
Ministry of Light Industry, Bucharest (Rumania). Central Lab.
Maria Rusanovschi, Elena Iliescu, and Bathia Zilberstein.
Industria Textila (Bucharest, 17, (3), p160-165, 1966.

Descriptors: Biochemical oxygen demand, Hydrogen sulfide, Coagulation, Absorption, Chemical precipitation.
Identifiers: *Felt manufacturing plant, *Felt, Wool, Dyestuffs, Dyehouse wastes, Chromium compounds.

Studies were made on residual waters coming from a felt manufacturing plant. The total volume of residual waters in 5,000-6,000 m. 3/24 hrs. and contains large amounts of vegetal, animal, and synthetic materials. The water from the preliminary treatments of the wool are dark colored, contain suspended matter and fats, and have an alkaline reaction. They represent 1.3 percent of the total residual waters, but being the dirtiest they influence the total effluent. They analyze: pH 8.5-10, H2S 42.5-56.1 mg./l., KMn04 index 3700-4100, and B.O.D. (5-day) 1200-1500 mg./l., total fats 1.9-2.8g./l. The finishing waters contain dye residues, inorg. salts, detergents, H2S, and chromium compounds. The waters from the dyeing operation represent 57.6 percent of the total residual water; their characteristics are: pH 7.5, dark in color, H2S 23.4 mg./l., suspended matter (cellulose, short wool fibers) 354 mg./l., and pocess a low KMn04 index and low B.O.D. (5-day). The chemical methods for the treatment of the total residual water are coagulation and absorption. For coagulation, the following were used: (a) FeS04, (b) Al2 (S04)3 (c) FeCl3, (d) CaO, and (e) H2So4. For good results, the optimum amount of (a) = 1000-15000 and for (d) = 700-1000 mg./l. The sludge resulting from the treatment contains 58 percent inorg. matter: N 1.4-2.0, K as K20 3.5-6.3, and P as P205 0.1-0.25 percent. For adsorption, the following were used: activated charcoal, lignite slag, and residues of ion exchangers. The best results were obtained with activated charcoal. In general, absorption is too expensive to be used. (Livengood-North Carolina State)

COOLING TOWERS GET BIGGER AND BETTER AS WATER DEMANDS GROW.

Power Engineering, Vol 69, No 12, p 38-41, December 1965. 5 fig, 4 ref.

Descriptors: *Cooling towers, *Cooling water, *Thermal pollution, *Construction materials, Iron, Steel, Aluminum, Plastics.
Identifiers: *Redwood, *Service life, Natural draft, Mechanical draft.

The most important item in choosing a powerplant site is a source of cooling water. The problem of thermal pollution arises if a river cannot support the cooling load. Cooling towers, therefore, are needed to correct this problem. The two major types of cooling towers are the natural-draft and the mechanical draft. These towers are built of standard materials and coatings which are designed to provide satisfactory service life under normal conditions. Normal conditions include circulating water pH of between 6 and 8, chlorine content below 750 ppm, sodium bicarbonate content below 200 ppm, maximum temperature of 140F, and many other set standards. The standard materials include grey cast iron, nodular iron, steel, stainless steel, cast aluminum, wrought aluminum, copper alloys, redwood, Douglas fir plywood, asbestos cement, glass fiber reinforced polyester, resins, polypropylene, high density polyethylene, and many miscellaneous materials. If the standard materials are placed under abnormal conditions, special fasteners or heavy duty coatings may be required. (Osborne-Vanderbilt)

WORLD'S LARGEST HYPERBOLIC TOWER COOLS A POWER PLANT.

Engineering News-Record, Vol. 178, No. 5, p 58-59, May 4, 1967. 2 fig.

Descriptors: *Cooling towers, *Powerplants, Cooling water, Turbines, Condenser, Cast-in-place structures, Humidity, Water temperature, Thermal pollution, Thermal powerplants.
Identifiers: *Monongahela River, Cross-flow, Natural draft.

The world's largest cooling tower - a 370-ft-high, 378-ft-diameter, hyperbolic concrete shell - cools 360 million gallons of water per day for the new 130 million dollar, Fort Martin, W. Va., power plant. The two natural draft cooling towers, combining a cross-flow cooling system with a hyperbolic natural draft air flow system, is the most suitable and economic type for the large quantities of cooling water required. Each tower will be capable of cooling 250,000 gallons per minute from 114F down to 90F. The towers, according to Marley, are built to withstand a 30 psf surface load or a 100 mile per hour wind. To achieve this, each shell is supported on 70-ft-long precast concrete X-frame columns. In building the towers, Marley used specially designed steel form panels and platforms, which hange from previously placed concrete lifts, eliminating the need for conventional scaffolding. The reasons for the giant dimensions were to prevent fogging along the Monongahela River and to guard against a discharge of 720 million gallons of heated water a day. (Osborne-Vanderbilt)

WASTE WATER DISPOSAL ENHANCES AN AREA ECOLOGY,
Campbell Soup Co., Napoleon, Ohio.
G. Marvin Shutt.
Industrial Water Engineering, Vol 7, No 3, p 18-22, March 1970.

Descriptors: *Waste water treatment, Biochemical oxygen demand, Design, Economic efficiency, Microorganisms, Hydraulics, Slopes, Texas, Paris (Texas).

The development of the overland-flow technique of waste water treatment and disposal which won for Campbell Soup Co. the Sports Foundation's in 1969 Gold Medal Award for Best Single Plant Program in industrial water pollution abatement was presented. Plant waste water originated from two main sources: the cooling area and the vegetable washing area. The plant's waste water containing suspended and dissolved organic impurities - 550-900 ppm of BOD - was sprayed along the top of the watershed by conventional irrigation sprinklers. As it percolated through dense vegetative sod to the soil's surface the waste water left behind most of the suspended solids and it trickled downhill the dissolved impurities were subjected by soil microorganisms to biological degradation. Purified water collects at the terrace and flows to the receiving stream via prepared waterways. A study of underlying reasons for performance was prompted in 1968 and design parameters for increased capacity or efficiency of the existing system were developed. Four test sites comprising ten acres of the Paris, Texas cannery field were subjected to intensive scrutiny. Microorganisms activity, hydraulic loading, degree of slope and length of slope were the desired design parameters developed. A list of landmarks in the development of the program was given. The results of the two-year research effort was significant in that it assures success with overland-flow waste treatment for other processors in other locations (Kriss-Cornell)

WASTE WATER CHARGES IN GREAT BRITAIN,
West Hertfordshire Main Drainage Authority, Rickmansworth (England).
R. Wood
Industrial Water Engineering, Vol 7, No 1, January 1970, p 27-29. 2 fig

Descriptors: *Industrial wastes, *Waste treatment, *Optimum development plans, *Costs.
Identifiers: McGowan strength, *Process oxygen demand (POD).

A description of charges for industrial waste treatment in Great Britain which serve as a means of controlling the quality of the wastes discharged to the sewer, thereby controlling in turn the influent quality at the municipal treatment plant was given. The authorization of a charge for the service of sewerage and treatment at the minicipal treatment plant was initiated in 1937 and in 1961 the powers of the local authorities were extended. The policy described is that of the Institute of Water Pollution Control. An example given was that of the Mogden works of the Middlesex County Council where they first devised a volume/strength/solids formula which proved workable over a wide range of industrial wastes. To be effective the formula given stemed from an accurate calculation of the net costs of treatment at the municipal treatment plant. Rates themselves were included andadministrative overheads divided between capital and revenue expenditure. The WHMDA had operated a charging scheme based on this formula for a number of years. For non-inhibiting wastes, the use of the McGowan strength in volume/strength/solids formula assessed treatability to some extent. This was a calculation of the oxygen requirement for complete oxidation. Examples of the use of this method were given. 'Process oxygen demand' (POD) was suggested by Simpson as charges for industrial waste treatment based on requirements of the process to effect treatment. He indicated the possible breakdown of unit processes and his formula was shown. Control of industrial wastes could achieve optimum operating condition at the treatment plant and a minimum charge to both the general ratepayers and the industrial waste discharge achieved. (Kriss-Cornell)

WATER QUALITY IMPROVEMENT BY PHYSICAL AND CHEMICAL PROCESSES.
Texas Univ., Austin. Center for Research in Water Resources.

Water Resources Symposium No. 3, Center for Research in Water Resources, Austin, University of Texas Press, 1970. 448 p.

Descriptors: *Waste water treatment, *Water reuse, *Water quality, Standards, Tertiary, Wildlife, Estuaries, Agriculture, Design, Liquid wastes, Phosphorus, Ion exchange, Membrane processes, Sludge, Sludge disposal.
Identifiers: *Criteria, Sludge handling.

The most recent developments in the physical and chemical treatment of waste waters and handling and disposal of sludges were the subject of a special lecture series held in April 1969, at The University of Texas at Austin. The papers prepared for this third Water Resources Symposium sponsored by The University's Center for Research in Water Resources are presented. The content is particularly significant in the advanced treatment and technology now being considered for our expanding urban areas. The publication is divided into four sections. The first concerns itself with water quality requirements for reuse emphasizing criteria, objectives, and general water requirements, reuse of water by fisheries and wildlife facilities using both fresh water and estuarian systems. Problems of municipal reuse are described depicting actual plant operations. The second deals with functional designs related to the removal of settleable and suspended solids both in America and Europe. The third presents functional designs related to chemical treatment of liquid wastes. Implications are evaluated. Both theoritical discussions and practical applications are provided. And the forth treats of functional designs related to sludge separation and analysis of general sludge characteristics, thickining, sludge filtration and sludge conditioning, centrifugation, and disposal of sludge on land. (For individual papers see W70-08865 thru W70-08895). (Hancuff-Texas)

NATIONAL WATER QUALITY CRITERIA AN OBJECTIVES,
Federal Water Pollution Control Administratio
Washington, D.C.
Joe G. Moore, Jr.
In: Water Quality Improvement by Physical an Chemical Processes, University of Texas Pres Austin, 1970, p 3-9.

Descriptors: *Water quality, *Standards, Wate Quality Act, Legislation, Federal governmen State governments.
Identifiers: *Criteria, Objectives, Responsibility Agencies, Inforcement.

The federal program setting water quality sta dards, some of the assumptions which have bee made and experience which has been gained, th impact of this program on State Water Pollutio Control programs, and general ideas on the subje of water quality standards are discussed. The Wate Quality Act stipulated that the states at their optio had the first opportunity to establish standards an gave them until June 30, 1967, to do so. Thes standards then became subject to review and ap proval as federal standards by the Secretary of th Interior. After that date the Act permitted th Secretary of the Interior to establish standard directly. The Act does prescribe the mode of sta dard setting that emphasized federal-state coopera tion, and this provision had important con sequences. An unprecidented amount of state ac tivity in water pollution control was caused by th inclusion of a financial bonus tagged to waste wate treatment works construction grants for state which had established standards. Two basic con cerns of FWPCA are (1) the standards be practica and forceful and (2) they reflect natural condition when possible. The standards as of March 1969 have been approved by 49 out of the 50 states Only in the state of Iowa does disagreement as t the degree of treatment persist. Several kinds o criteria are found in the standards. Key numerica parameters are dissolved oxygen which range fro 3.5 to 7 mg/l for protection of various aquatic life pH with a general range of 6.5 to 8.5 determined b natural conditions, temperature where maximu limits are based on natural temperatures with per missible change from natural of not more than deg F and coliform organisms for which the tradi tional public health limits have been applied. GENERAL WATER QUALITY REQUIRE MENTS,
Wisconsin Univ., Madison.
James E. Kerrigan, and Gerald A. Rohlich.
In: Water Quality Improvement by Physical an Chemical Processes, University of Texas Press Austin, 1970, p 10-15. 6 ref.

Descriptors: *Water quality, *Standards, Wate Quality Act, Controls, Monitoring, Variability.
Identifiers: *Criteria, Requirements, FWPCA Water uses.

Quality identifies the degree of excellence which thing possesses. The fundamental point is that th assignment of a level of quality to water is relativ depending upon the use for which the water is as signed. To evaluate the characteristics of water it i essential to know whether these characteristic have any detrimental effect on the assigned use Thus pollution has come to mean the introductio or persistence of any material in the resource whic interferes with alters, or destroys some beneficia use. In our society it is recommended that w develop criteria for domestic water supplies recreation, agriculture, irrigation, fish and wildlife industrial water and aesthetic uses. Each of these use areas is influenced individually by the presence and concentration of key water characteristics. Fo a parameter to be useful in the development, i must meet the following demands: (1) It should in dicate whether the water has been adversely af fected for some use. (2) Its measurement should be practical, reproducible and relatively accurate. (3 Its measurements taken at sufficient interval

hould identify the variability and give the statistical relevance of the parameter. (4) Its data should eflect the nature of its long-term variability. It is mphasized that the level of treatment required for he quantities of waste discharged allowable be dicated by the characteristics of the receiving waters nd the effects imposed on these waters by the ischarged rather than the use of a uniform effluent tandard. (See also W70-08864). (Hancuff-Texas)

VATER QUALITY REQUIREMENTS FOR REUSE BY FISHERIES AND WILDLIFE,
Bureau of Sport Fisheries and Wildlife, Fort Collins, Colo.
Croswell Henderson.
n: Water Quality Improvement by Physical and Chemical Processes, Univ of Texas Press, Austin, 970, p 16-23. 23 ref.

Descriptors: *Water reuse, *Standards, *Fisheries, Wildlife, Water quality, Water resources, Sewage reatment, Waste water treatment, Recreation, Research and development, Toxicity.
Identifiers: *Criteria, Organisms.

The pollution situation today with respect to fish nd wildlife is not particularly bright. The FWPCA ublished an annual report since 1960 entitled Pollution Caused Fish Kills.' The 1967 report ublished in 1968 shows over 11 million fish killed y pollution caused incidents reported from 40 tates. Of the total number of fish, 71% reported illed by industrial wastes, 16% by agricultural vastes and 8% by municipal wastes, and the emainder by other causes. Of the 375 separate incidents reported 139 were caused by industrial vastes, 91 by municipal wastes, 90 by agricultural vastes. The major requisite to maintaining a fishery s to have an adequate quantity of water as well as a vater of satisfactory quality at all times during the ear. From the standpoint of fisheries, the primary bjective by establishing water quality standards is o observe the survival, reproduction and well-eing of aquatic organisms. Standards must be ased on a thorough knowledge of the environmental requirements of those organisms that must be rotected. A summary is presented of the key riteria and recommendations considered to be atisfactory for aquatic life and wildlife. These contain such variables as dissolved materials which include toxic materials, pH, alkalinity, acidity, temperature, dissolved oxygen, carbon dioxide, oil, turbidity, settleable material, color, floating material, tanking substances, radionuclides, plant nutrients and toxic substances. These variables are evaluated for aquatic organisms as well as water fowl and other wildlife. (See also W70-08864). (Hancuff-Texas)
W70-08867

FISHERIES AND WILDLIFE IN THE MARINE HABITAT AND SOME RELATED WATER QUALITY REQUIREMENTS,
Texas Parks and Wildlife Dept., Rockport.
Earnest G. Simmons.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 24-30. 39 ref.

Descriptors: *Water quality, *Fisheries, *Wildlife, *Estuaries, Salinity, Temperature, Dissolved oxygen, Pollutants, Physical properties.
Identifiers: *Marine environment.

A variety of definitions is given for the word 'estuary,' with the final most generally accepted definition as: an estuary is a semi-enclosed coastal body of water having a free connection with the open sea and within which the sea water is measurably diluted with fresh water deriving from land drainage. The importance of estuaries are emphasized from a standpoint of being indispensable to water fowl, pelicans, quail, cranes, eagles, osprey, and shore wading birds. In addition they are important as nursery grounds for such fish as spotted sea trout, channel bass, and red fish. Estuaries are very important from the standpoint of spawning grounds. Destruction of the estuaries would eliminate or adversely affect commercial shrimp, oysters, blue crabs, menhaden, red fish, and many other forms of marine life vital to the food chain. The factors discussed effecting wildlife in estuaries are salinity, temperature, dissolved oxygen, pesticides, and other pollutants, the latter being mostly industrial. The first three of the aforementioned has a wide range of acceptability; however, the last two categories present problems in determining the exact defects of such complex problems. (See also W70-08864). (Hancuff-Texas)

MUNICIPAL REUSE OF WATER,
National Inst. for Water Research, Pretoria (South Africa).
G. J. Stander, and L. R. J. van Vuuren.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 31-48. 19 fig, 3 tab, 7 ref.

Descriptors: *Water reuse, *Tertiary treatment, *Domestic water, Sewage treatment, Waste water treatment, Water supply, Reclamation, Activated carbon, Filtration, Chlorination.
Identifiers: *Pretoria (South Africa), *Criteria, Fractionation, Flotation, Ammonia stripping.

The return flows which are available at sewage purification plants serving metropolitan areas in South Africa constitute a major proportion of the fresh water intake. The optimization of municipal reuse requires a critical appraisal of a number of important factors. For example, whereas the quality of secondary purified sewage effluents in South Africa is generally suitable for cooling water and limited industrial use, advanced purification is required for domestic quality water for general distribution. A comparison of the quality of reclaimed water with the national standards for drinking water is tabulated. The criteria is broken into four main parts; (1) potability, dealing mostly with metallic ions, (2) health hazards dealing with potentially dangerous ions, (3) toxicity covering most of the heavy metals, and (4) chemical indicators of pollution as COD, BOD total nitrogen, etc. A fullscale effluent reclamation plant which is today supplying 1/3 of the water demand for the city of Windhoek utilized algae ponds and flocculation/flotation process. The quality of the finished water meets the requirements prescribed by the World Health Organization. Due to encouraging results obtained with the pilot plant study at Pretoria Municipal Sewage Disposal Works, a 1 mgd demonstration plant is being erected. One of the objectives of this experiment is to demonstrate to the public the possible reclamation of sewage effluents for domestic use and elimination of public prejudice and aesthetic objections. (See also W70-08864). (Hancuff-Texas)
W70-08869

HEALTH ASPECTS OF WASTE WATER REUSE,
Public Health Service, Dallas, Tex.
Charles W. Northington, Shih L. Chang, and Leland J. McCabe.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 49-56. 22 ref.

Descriptors: *Public health, *Water reuse, Research and development, *Infections, Toxicity, Tertiary treatment, Sewage treatment, Waste water treatment.
Identifiers: *Carcenogens.

A brief history is presented of the development of waste water reuse for domestic water supply and the need for waste water reuse research is emphasized. If the reuse of waste water for drinking purposes has really arrived there is a gross imbalance of the federal effort to study the health aspects. As an illustration the budget allowed for advanced waste treatment research approximately 8 million dollars in the fiscal year 1969 as opposed to the entire water hygiene research program of the Public Health Service for the same year of $537,800. The reuse of waste water is discussed from the standpoint of biological acceptibility as depicted by pathogens and parasites. The importance of consideration of low-level transmission of viruses by water is examplified by a 50 mgd supply which has a 99.99% reduction of virus typically reducing the count to 1 unit per 50 gallons; assuming 0.2% of the total supply is consumed as drinking water about 2,000 virus units will be swallowed daily by the people supplied with this water. Similar examples are given for bacterial infections, protozoan infections, and nematode and helminth infections. In addition studies are needed to determine the chronic toxicity, carcegonic effects, sex hormone effects and radioactive effects of waste water reuse. (See also W70-08864). (Hancuff-Texas)
W70-08870

WATER QUALITY REQUIREMENTS FOR RECREATION,
Wisconsin Univ., Green Bay.
Edward H. Storey, and Robert B. Ditton.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 57-63. 1 fig, 17 ref.

Descriptors: *Water quality, *Recreations, Ranges, Water reuse, Tertiary treatment, Waste water treatment.
Identifiers: *Threshold, *Criteria, *Variables, Requirements.

Recreation usage is the most rapidly growing demand on water. Studies conducted by the Outdoor Recreation Resource Review Commission in 1960 revealed that 40% of outdoor recreation participants favored water-based recreation activities over any others. Subsequent studies conducted by the Bureau of Outdoor Recreation have revealed that water-based activities are increasing sharply as evidenced by a 12% increase in fishing, an 18% increase in boating and a 15% increase in swimming during the half decade from 1960-1965, while population increased only 8%. Paradoxically as the nation's recreational demands upon water have increased, the suitability of the nation's resources to support water recreation activity has steadily deteriorated. The water quality variables effecting the ability to support or produce recreation include biological, chemical, and physical properties, each of which may induce a variety of psychological reactions. The psychological variables are broken into three categories: (1) The effective range is that quality of water which is not polluted sufficiently to influence the suitability of water for a specific recreational use. (2) The threshold is the minimum level at which water quality necessary to support a specific recreation. (3) The affected range is that range of quality within which the suitability of water for a specific use is deleteriously affected. Various references are cited in such areas as benefit cost analysis for water quality goals, requirements for body contact, recreational activities, and aesthetic acceptance of water oriented recreation. (See also W70-08864). (Hancuff-Texas)
W70-08871

REUSE OF WATER FOR THE PRODUCTION OF AGRICULTURE CROPS,
Texas Tech Univ., Lubbock.
Clark Harvey, Chester C. Jaynes, and Gerald W. Thomas.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 64-69. 1 tab, 20 ref.

Descriptors: *Water quality, *Productivity, *Agriculture, *Crops, Water reuse, Industrial waste, Surface runoff, Recharge, Lakes, Sewage treatment, Effluents.
Identifiers: *Criteria.

Sources of reuse water for the production of agricultural crops is reported for sewage effluent, industrial plant wastes, and surface runoff. The amount of sewage effluent discharged from municipal treatment plants in the United States on an average day has been estimated at 65,000 acre feet. Several examples are cited in which increased crop production was realized due to irrigation with sewage effluent for example grain sorghum yields were improved by sewage effluent (4,494 lbs/acre) over well water (3,572 lbs/acre) when each was used without additional nitrogen. Problem constituents of sewage effluents that may build up toxic levels in soils are dissolved solids, suspended solids, acids and metallic elements. Industrial waste is another source of reuse water that may be used in the production of agriculture crops. Examples are given of milk wastes, pulp mill and paper making wastes and paper board mill wastes. The southern High Plains of Texas constitute one of the major irrigated agriculture areas of the world. The Ogallala formation reservoir is hydrologically isolated and recharge can only come from precipitation. The High Plains area is characterized by numerous shallow undrained depressions or playas. Artificial groundwater recharge can be accomplished by injecting water collected in playa lakes into a multipurpose well. Groundwater recharge can conserve 75-80% of the water in the playa lake as compared with the 90% normally lost through evaporation. (See also W70-08864). (Hancuff-Texas)
W70-08872

TREATMENT OF WATER FOR BOILING AND COOLING PURPOSES,
Engineering-Science Inc., Arcadia, Calif.
Montague Blundon.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 70-79. 7 fig, 17 ref.

Descriptors: *Water reuse, *Water treatment, *Waste water treatment, *Boilers, Ion exchange, Water softening, Reverse osmosis, Electrodialysis, Cooling water, Filtration, Detergents, Alkylbenzene sulfonate.
Identifiers: Condensate, Removal.

To be suitable for conventional boiler make up, effluents from treatment processes, either municipal or industrial, must go through pretreatment for removal of troublesome constituents. Ammonia is corrosive to copper and copper alloys, and a number of treatment processes are given for its removal. Problems of phosphates stem from the possibility of the presence of orthophosphates reacting with residual hardness to form a hard scale. Household and industrial detergents may cause considerable problems with foaming, carry over and film boiling as well as fowling of ion exchange resins. A typical flow diagram of make-up treatment is presented and includes a cationic exchanger, degasifier, anion exchanger, and a mixed bed of cation and anion exchange material. Two other advanced processes that will undoubtedly soon find use in boiler feed water treatment include reverse osmosis, and electrodialysis. Evaporators are still a significant factor in feed water treatment field. Multi-stage flash evaporators produce excellent feed water. A short discussion is presented on condensate treatment. (See also W70-08864). (Hancuff-Texas)
W70-08873

UNITED STATES PRACTICES IN SEDIMENTATION OF SEWAGE AND WASTE SOLIDS,
Rex Chainbelt, Inc., Milwaukee, Wis.
Anthony Geinopolos, and William J. Katz.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 83-91. 5 fig, 18 ref.

Descriptors: *Sedimentation, *Settling basin, *Design, Equipment.
Identifiers: *Zone, Suspended solids, Loading, Retention time.

Fundamental to the process of sedimentation is the consideration of the character of suspended matter to be removed and the hydraulics of the basin in which solid-liquid separation is to be achieved. For example the suspended matter to be removed may range from discrete particles to flocculant materials may be settleable or floatable and may be present from low to high concentrations. Separation properties of solids therefore will depend on their type and character. Added to these difficulties is the effect hydraulic conditions have on solids removal by sedimentation basins. Included in a discussion of clarification equipment design is the size and shape of the basin, the inlet and outlet configurations, surface and solids loading, and hydraulic effectiveness as controlled by turbulence and short circuiting. An example of design is presented based on a complete examination of two criteria: overflow rate, and solids loading. (See also W70-08864). (Hancuff-Texas)
W70-08874

EUROPEAN PRACTICES IN SEDIMENTATION,
Emschergenossenschatt, Essen (West Germany).
Karl-Heinz Kalbskopf.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 92-103. 21 fig, 13 ref.

Descriptors: *Settling basins, *Performance, *Equipment, *Sedimentation, Flocculation, Efficiencies, Design, Costs.
Identifiers: *Loading, Europe, Practices.

A simple and economical method of separating settleable solids from liquids is of paramount operational importance to all mechanical, chemical, and biological processes applied in treating sewage. Over the years a great many different types of sedimentation units have been developed. The usual design factors do not cover all the complex physical and chemical processes that may take place in tanks when sewage and its solid particles float through the system. Most of the design data used ar e operating parameters established empirically. In Europe it is common practice to design sedimentation tanks with a certain detention period. The detention period chosen for domestic sewage range from 0.5 to 2.5 hours for primary sedimentation and 1.5 to 4 hours for secondary sedimentation. It is of utmost importance to acknowledge the fact that a very high efficiency can be reached only if optimum tank proportions are chosen with regard to hydraulic conditions. The usual design data determining the volume of a tank are: (1) the overflow rate ranging from 0.5 to 1.5 meters per hour in horizontal and 2.5 meters per hour in vertical flow tanks; (2) the solids loading (3.5 kilograms per square meter.hour in horizontal float tanks up to 7.5 kg/sq meter.hour in vertical flow; (3) the mean flow velocity (0.8 to 1.5 cm/sec) and (4) weir rates (5 to 20 cu meters per meter hour). Important design values for final sedimentation tanks are presented which include sludge volume index as a decisive influencing factor on the permissable solids loading. (See also W70-08864). (Hancuff-Texas)
W70-08875

SAND AND DIATOMITE FILTRATION PRACTICES,
Iowa State Univ., Ames.
E. Robert Baumann, and Charles S. Oulman.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 104-131. 19 fig, 2 tab, 20 ref.

Descriptors: *Filtration, *Diatomaceous earth, *Sands, Operations, Variability, Design, Pre-treatment, Particle size, Filters, Coatings, Headloss.
Identifiers: Polyelectrolytes.

Theoretical and empirical techniques for predicting filter performance have been developed and perfected. It will be necessary for engineers to continue to base filter design on experience. Several guides are presented for engineers designing granular filters. (1) Influent rate control has ma distinct advantages over effluent rate control variable declining rate system reduces headl required for flow control. (2) Dual or multi-me filters can significantly lengthen the run produce better water quality than a single medi Coated filters may be used as secondary filtrat media for polishing the effluent from granular ters. (3) Water pre-treatment control has an imp tant effect on filtrate quality. Polyelectrolytes improve effluent quality when added in very sn amounts to filter influent as it enters the filter b But polyelectrolyte can not substitute for adequ control of coagulant dosage and pre-treatment. Linear increase of headloss versus volume of trate should be the goal when filters are operate a constant rate. Convex filtrate curves of headl versus volume indicate surface rather than de removal of solids and higher filtration rates may needed. Concave filtrate curves of headloss ver volume indicate weak removal of solids and pot tial passage of turbidity during constant rate fil tion. (See also W70-08864). (Hancuff-Texas)
W70-08876

FILTRATION AND MICROSTRAINING SECONDARY EFFLUENT,
Metropolitan Sanitary District of Greater Chica Ill.
Bart T. Lynam, and Vinton W. Bacon.
In: Water Quality Improvement by Physical a Chemical Processes, University of Texas Pr Austin, 1970, p 132-148. 16 fig, 1 tab, 10 ref.

Descriptors: *Filtration, *Tertiary treatme *Evaluation, *Efficiencies, Headloss, Sands, Wa water treatment, Sewage treatment.
Identifiers: *Microstraining, Loadings, Suspend solids, Chicago (Ill).

A rational approach to the analysis of data relat to the performance of filtration devices in treat secondary activated sludge effluents to remo suspended solids is presented. In it should be co sidered suspended solids removal as a function suspended loading in terms of lb/sq ft/day. T takes into account the parameters of hydrau loading, in terms of gal/min/sq ft, solids input a the resultant effluent from the filtration process laboratory scale experiment is cited in which conditions of filtration are 200 gal/sq ft/hr (gal/min/sq ft) 36 inches of commercial grade 7- sand, solids in the media of 0.9 lb/sq ft/day wo apply within the constraint of a given sand type a operating head or when investigating a micr trainer the fabric size, operation of drum speed a head conditions. A comparison is present between a sand filter and microstrainer. The cost a 10 MGD plant is computed based on equivale results and loading. A cost differential of 0. cents/1000 gal (2.4 cents for sand filtration a 2.76 cents for microstraining) is calculat Microstrainers have advantage over sand filters that there is a low hydraulic head and minimu space requirement. (See also W70-08864). (Ha cuff-Texas)
W70-08877

HIGH-RATE SEDIMENTATION WITH TI TUBE CLARIFIER CONCEPT,
Neptune Microfloc Inc., Corvallis, Oreg.
Gordon Culp, and Walter Conley.
In: Water Quality Improvement by Physical a Chemical Processes, University of Texas Pre Austin, 1970, p 149-166. 11 fig, 1 tab, 15 ref.

Descriptors: *Sedimentation, *Settling basi *Tubes, *Filtration, Water treatment, Waste wa treatment, Sewage treatment, Turbidity.
Identifiers: Tube-clarifier, Mixed media filt Clarifiers, Theory, Polymers, Suspended solids.

Two basic settling tube systems are illustrated: t first is essentially horizontal, the second is steep inclined. The essentially horizontal tube settler used in conjunction with a filter and has its slud removed during the back wash cycle of the filter

ich time the tubes are drained and the sludge rried to waste. The water drained from the tubes replaced with the last portion of the filter ckwash water thus no additional water is lost due tube drainage and no mechanical sludge removal uipment is required. The steeply inclined tube tlers have continuous sludge removal achieved rough gravity settling (if the angle is in excess of deg). Practical applications for the tubes are scribed such as tertiary waste water treatment, d water treatment. Significant advantages are ined when considering hydraulic loadings. Conerably higher rates than permissible for convenal horizontal or upflow clarifiers are attained. ading rates of 3 to 5 gallons per minute per uare foot of tube entrance area are permissible ile limits of 1 gallon per minute per square foot e common for conventional flow clarifiers. Mixed edia filtration technology is also described. Conuration of the mixed media bed is such that more rticles can be stored before backwashing is quired. Installation of mixed media significantly creases the capacity of existing plants without anging their physical area. (See also W70-864). (Hancuff-Texas)

GH-RATE FILTRATION OF INDUSTRIAL ASTES,
nbionic Designs, Inc., New York.
gene J. Donovan, Jr.
Water Quality Improvement by Physical and emical Processes, University of Texas Press, stin, 1970, p 167-189. 19 fig, 2 tab, 5 ref.

escriptors: *Filtration, *Industrial waste, *Waste ter treatment, Design, Pilot plants, Headloss.
entifiers: *Multi-media filters, Polymers, spended solids.

gh-rate, deep-bed, in-depth filtration has distinct vantages over ordinary techniques of chemical agulation and/or sedimentation for suspended lids removal. The required area for the treatment substantially less. The plants are constructed in odules which can easily be repeated to fit any w or design rate. Handling and feeding of bulk agulant chemicals is eliminated and disposal of sultant sludges minimized. The filter design rameters are tabulated and include effluent ality, influent characteristics, suspended solids, mperature, media characteristics, filtration rate, adloss and polyelectrolytes. Pilot plant tests were ade on a hot steel rolling mill discharge. A 2.3 m sand and 5.1 mm anthracite medium were used parately and then combined and tested many nes at various rates. The rate of 16 to 18 l/min/sq ft was selected to produce an effluent ss than 15 mg/l suspended solids consistently. A ll-scale plant was designed with 2 feet of sand der 5 feet of anthracite. Comparisons between e 6-inch test filter and a full-scale 225 sq ft filter it showed equivalent results. The filter is ckwashed through an air scour for 5 minutes at 8 m/sq ft and then flushed with water for 10 inutes at 30 gal/min/sq ft. The cost of an industri- waste filtration installation will vary with the aste flows, design rate, type of installation, neces- ry backwash and sludge handling facilities and cal cost factors. Rough costs are presented for avity-type concrete construction filter plants with dge thickener and vacuum filters included. (See so W70-08864). (Hancuff-Texas)

LOTATION OF SEWAGE AND WASTE OLIDS,
ational Inst. for Water Research, Pretoria (South frica).
. J. Stander, and L. R. J. van Vuuren.
: Water Quality Improvement by Physical and hemical Processes, University of Texas Press, ustin, 1970, p 190-199. 4 fig, 3 tab, 8 ref.

escriptors: *Waste water treatment, *Floccula- on, *Coagulation, Sewage treatment, Industrial astes, Lime, Water softening, Chemicals.
Identifiers: *Flotation, Waste solids, Laboratory scale.

Flocculation/flotation is discussed as a unit process for separating coagulable suspended organic material from waste waters from fish and fishmeal processing plants, slaughter houses, primary clarified sewage, secondary effluents and oxidation and maturation pond effluents. Various flotation processes are essentially divided into two: dissolved air and dispersed air systems. The theory of dissolved air flotation provides for (1) adhesion of gas bubbles, (2) trapping of gas in floc structure as bubbles rise, (3) adsorption of gas bubbles as the floc structure is formed. Dispersed air systems are based on shearing actions of propellers or diffusion of gas through porous media to produce micro-air bubbles. For dissolved air systems bubbles of 80 microns usually exist while bubbles of 1000 microns are involved in dispersed air systems. In designing pilot scale flotation equipment laboratory investigation should first be conducted to establish criteria such as suitable flocculants, mixing conditions, aeration requirements and fluid velocities. Such surface active agents such as ABS or phospholipids appear to serve as activators for bubble attachment in flotation treatment of sewage and waste solids respectively. In the latter type of effluent sulfuric acid was most effective as a coagulant whereas excess lime showed definite advantages in treating sewage effluents. In laboratory scale investigations reductions of up to 70% in COD were achieved using sulfuric acid as a coagulant in fish factory and abattoir effluents. Removal of organic load with a laboratory flotation unit is tabulated for primary clarified sewage maturation ponds, slaughter house wastes, pulp and paper mill effluent and fishmeal processing effluents. INTERFACIAL PROPERTIES ON OILY WATER CLARIFICATION,
Esso Research and Engineering Co., Florham Park, N.J.
Gerald P. Canevari.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 200-216. 11 fig, 9 ref.

Descriptors: *Oil, *Industrial waste, *Separation techniques, *Interfaces, Industrial water, Surface tension, Skimming, Waste water treatment, Equipment, Electrical stability, Stabilization, Chemicals.
Identifiers: *Surface active agents, Electrical double layer.

In most liquid-liquid dispersions there is one of three steps of the separation process that will usually be limiting. In sequence these steps are dispersed droplet collision, coalescence and finally settling. Techniques of separation are mainly directed at preferentially enhancing one of these steps, thus the identification of the limiting step for a given dispersion is a convenient means of characterizing the waste and selecting an appropriate separation technique. The significance of the drop size in oily water clarification problems can be considered as influencing the controlling parameter which is rise rate. The effect of interfacial properties on the rise rate of dispersed droplets is discussed and an example is given considering a liquid air interface. The presence of surface active agents has a major effect on the interfacial properties and the resultant ease of separation. The molecular structure of a surfactant determines its behavior at the interface, that is, orientation, concentration, adsorption rate and adsorption affinity. Although orientation of the surfactant at the oil water interface cannot be discerned, indirect evidence of its orientation can be observed by means of a hydrofilled balance. Other physical properties of significance in discussing oil water separation are viscosity of the continuous or external phase, the density difference between the oil phase and the water phase and the droplet diameter which is strongly influenced by interfacial forces. The influences of such items as suspended solids and the electrical double layer are discussed. (See also W70-08864). (Hancuff-Texas)

COAGULATION IN WATER AND WASTE WATER TREATMENT,
North Carolina Univ., Chapel Hill.
Charles R. O'Melia.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 219-236. 4 fig, 30 ref.

Descriptors: *Coagulation, *Colloids, *Translocation, *Electrical stability, Waste water treatment, Water treatment, Chemical adsorption, Flocculation.
Identifiers: *Polymers, *Destabilization, Electrical double layer.

When considering the theory of the practice of coagulation it is important to distinguish between two separate and distinct steps: (1) The particles to be aggregated must be able to adhere to each other when brought into contact (destabilization step is brought about by chemical coagulants); (2) Destabilized particles must be transported or brought into contact to effect the formation of larger particles. Three mechanisms of colloid destabilization are presented and discussed in detail. Destabilization may be accomplished by an indifferent electrolyte through compression of the electric double layer surrounding the colloidal particle, it may occur through neutralization of the charge on the particle by the specific adsorption of a coagulant of opposite charge or it may occur through the formation of a bridge through colloidal particles of a polymeric molecule. Destabilization in most conventional water and waste water treatment processes is accomplished by polymers. These polymers may be added directly to the process, may be produced within the process from salts added to the system, or may be produced directly within the system from substances present in the waste water. A summary of some evidence for this opinion is presented. Intraparticle destabilization can be accomplished in several ways. Three mechanisms are presented: (1) contact by thermal motion, (2) contacts resulting from bulk fluid motion, (3) contacts from settling of the particles. (See also W70-08864). (Hancuff-Texas)

PHOSPHATE PRECIPITATION,
Harvard Univ., Cambridge, Mass.
James O. Leckie, and Werner Stumm.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 237-249. 7 fig, 3 tab, 21 ref.

Descriptors: *Chemistry of precipitation, *Phosphate, *Solubility, *Kinetics, Hydrogen ion concentration, Nutrients, Chemicals, Phase diagram, Chemical precipitation.
Identifiers: Stoichiometry, Solid phase.

The continuous precipitation of phosphate in treatment of waste is a dynamic process and most likely equilibrium conditions are not attained; however, equilibrium considerations can aid attempts to understand the mode of phosphate removal. Furthermore, equilibrium calculations provide boundary conditions towards which the system must proceed. Formulation of the stoichiometry of the chemical reaction defined the minimum requisite quantity of chemicals. The stoichiometry and pH dependence is illustrated through the use of several solubility diagrams for iron phosphate and aluminum phosphate. The precipitation of phosphate with iron and aluminum is very fast; however, the rate of removal is controlled by agglomeration of colloids and by settling. Many factors may catalyze or retard the rate of precipitation. Flouride, even in trace concentrations enhances the rate of precipitation; while organic substances may act as crystal poison. Thus phosphorus removal is probably the most expensive step in treatment of waste. Design factors for phosphate removal plants

need to be based on pilot plant scale studies. (See also W70g08864). (Hancuff-Texas)
W70-08883

CHEMICAL OXIDATION AND REDUCTION,
Planidro, Sao Paulo (Brazil).
Max Lothar Hess.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 250-257. 4 fig, 8 ref.

Descriptors: *Chemicals, *Oxidation-reduction potential, Oxidation, Reduction (Chemical), Waste water treatment, Sewage treatment.

The knowledge of the redox potentials is important when considering the automatic operation of chemical oxidation and reduction processes. The transfer of electrons from one compound to another results in different potentials that can be measured by means of a potentiometer. In this the potential of an inert electrode immersed in a solution is compared with the potential of a reference electrode. The potential of the so-called Normal Hydrogen Electrode or NHE is assumed to be 0. Since the NHE is not suitable for practical use, other reference electrodes are commonly adopted. When considering waste water treatment, even the cheapest reductants and oxidants represent a considerable expenditure. Too main measures of economy should be kept in mind. (1) Segrating the waste that ought to be chemically treated from the other waste streams and (2) Monitoring redox potentials for excess reagent indicators. Common oxidants are discussed such as oxygen, chlorine, chlorous compounds, ozone and nitrates. Common reductants such as ferrous sulfate, sulfur dioxide, hydrazene, and iron are also discussed. Examples of chemical oxidation of waste waters are given for cyanides, cannery wastes and phenols. Examples of chemical reduction of waste waters are given for chromates, and decolorization of some synthetic dyes. All oxidation and reduction operations should be monitored to avoid finishing with an excess of oxidant or reductant which could be detrimental to receiving waters. (See also W70-08864). ION EXCHANGE FOR INDUSTRIAL WATER,
Rohm and Haas Co., Philadelphia, Pa.
Jerome G. Gaffney, Robert Kunin, and Donald G. Downing.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970. p 258-293, 16 fig, 9 tab.

Descriptors: *Industrial water, *Ion exchange, *Water softening, *Water quality, Cation exchange, Anion exchange, Desalination, Waste water treatment, Acid mine water, Tertiary treatment.
Identifiers: *Deionization, Regeneration, Trouble shooting.

There are two basic applications of ion exchange to the treatment of water in industry: water softening and water deionization. A discussion is presented on various ion exchange materials for water softening, as well as ion exchange resins involving the use of both cationic and anionic exchange. The measurement and effects of sodium leakage through a deionizing unit is discussed in regard to effluent quality. Choice of exchange resins is determined by the quality of water desired and costs involved. Discussion is presented on the removal of the various constituents such as free mineral acidity, carbon dioxide, silica and other various chemical constituents. Water desalination and renovation is discussed for the treatment of brackish waters in the 500-300 mg/l salinity range. A recently developed desalination technique utilizing ion exchange resins is described for this process. A combined ion exchange and coagulation process for treating acid mine drainage waters has been developed resulting in an effluent suitable for industrial, agricultural, or domestic usages. A modification of the process for treating acid mine waters can be employed as a tertiary sewage treatment process. The cost for treating secondary sewage effluent is only $0.15 to $0.20/1000 gal. Problems in water use in the industrial field may be encountered in four essential areas: (1) equipment, (2) operation, (3) exchange resin, and (4) influent changes. The important facits of these catagories are presented with illustrations of the major problems in each. (See also W70-08864). (Hancuff-Texas)
W70-08885

EXPANDED BED ACTIVATED CARBON ADSORPTION SYSTEMS FOR WASTE WATER TREATMENT,
Michigan Univ., Ann Arbor; and FMC Corp., Princeton, N.J.
Walter J. Weber, Jr., Charles B. Hopkins, and Ralph Bloom, Jr.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970. p 294-311, 11 fig, 1 tab, 17 ref.

Descriptors: *Activated carbon, *Tertiary treatment, Pilot plants, Organic compounds, Waste water treatment, Efficiencies, Mathematical model, Filtration.
Identifiers: Expanded bed, Packed bed.

A study is made directed towards field evaluation of expanded bed adsorbers which have certain potential operating advantages over packed-bed adsorbers for treating solutions which contain suspended solids. Chlorinated secondary effluent was used for the study. Experimental programs consisted of a 100 day comparative study of packed-bed and expanded bed modes of operation using 10-inch diameter steel columns with a total carbon depth of 12 feet. Both unfiltered and filtered secondary effluents were tested in paralleled operations. The sewage was comprised of approximately 25% industrial wastes 75% domestic waste. Secondary effluent was fed directly into two of the four adsorbers, white filtered secondary effluent was fed to the other two. All systems were operated at a loading of 5 gal/min/sq ft (2.72 gal/min). Filtration of the secondary effluent was accomplished with a 38 inch diameter cylindrical tank containing a 9 inch layer of anthracite coal (effective size 0.59 mm) and a 9 inch bed of filter sand (effective size 0.62 mm). Results of the study are presented graphically in terms of total organic carbon removal and soluble organic carbon removal versus volume of water treated. An expanded bed system can produce more treated effluent than an equivalent pack-bed system because of less down time for carbon cleaning operation. The elimination of frequent carbon cleaning results in a savings in operating labor for the expanded bed. For a 10 MGD plant the cost reduction probably would be about 0.1 cents/1000 gal. Pumping cost differences would be about 0.2 cents/1000 gal. (See also W70-08864). (Hancuff-Texas)

REVERSE OSMOSIS DEVELOPMENTS,
Santa Rosa Medical Center, San Antonio, Tex.; and Texas Univ., Austin.
David L. Goff, and Earnest F. Gloyna.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970. p 312-326, 9 fig, 2 tab, 33 ref.

Descriptors: *Reverse osmosis, *Operations, *Membranes, *Membrane processes, History, Mathematical model, Design, Desalination, Waste water treatment, Tertiary treatment.
Identifiers: Systems, Transport equation.

A historical development of the phenomenon of semi-permeable membranes and osmosis beginning with Abbe Nollet's observations in 1748 is presented. Some of the advantageous features that reverse osmosis offers as a separation process include: (1) Low energy requirements since phase changes are not required to effect the separation, (2) Simple and flexible operation, (3) Compa plant size. The heart of the process is a semi-perm able membrane. Although improved membran are being developed the modified cellulose aceta membranes have been forerunners in the reve osmosis process and have brought in process to t point where it merits practical consideration many water separation applications. A transp equation is developed based on a Fickian diffusi process. The solute transport is accomplished adsorption, diffusion, desorption process with d fusion assumed the rate controlling step. Vario operational considerations are presented. T physical and chemical degradation limit the use lifetime of the present day RO membranes to abo 6-12 months. Cost estimates for small brack water reverse osmosis plants are presented. For a MGD plant the total costs including plant amorti tion, membrane replacement, energy, operati and maintenance if $0.59/1000 gal. For the sa conditions a 10 MGD plant is $0.38/1000 gallo (See also W70-08864). (Hancuff-Texas)

THE APPLICATION OF MEMBRANES T SEWAGE AND WASTE TREATMENT,
Resource Engineering Associates Inc., Stamfo Conn.
Robert W. Okey.
In: Water Quality Improvement by Physical a Chemical Processes, University of Texas Pre Austin, 1970. p 327-338, 8 fig, 6 tab, 11 ref.

Descriptors: *Membranes, *Waste water tre ment, *Sewage treatment, *Tertiary treatment, * everse osmosis, *Membrane processes, Costs, I dustrial wastes, Pulp wastes.

Membrane filtration includes a broad range separation processes such as filtration, ultra-filtr tion, hyper-filtration, micropore-filtration, diff sion, and reverse osmosis. Generally, tho processes defined as super-filtration, hyper-filtr tion, and micro-filtration or the like refer processes in which discrete holes or pores exist in filter media and the efficiency of this type of filtr tion depends entirely on the difference of si between the pores and the particles to be remove The pores are generally in the order of 1000 100000 A and larger. Waste waters requiring trea ment frequently have a broad range of contamina size varying from ions to colloidal particles of up 1000 to 10000 A in their maximum dimensio Therefore, membranes employing both diffusi and pore flow have application in waste manag ment. Most membrane systems are designed in a s ries-paralleled layout in which the dilute proce stream passes through several parallel membra blocks or housing. This concept derives from t face that direct onflow systems tend to foul bad Operating characteristics are tabulated for an a tivated sludge membrane plant treating both ra sewage and secondary effluent. Extensive studi on the treatment of various pulping waste strea are discussed. In another extensive study of t removal of ions and organics (2000 mw) fro secondary effluents the separation required a fl value of 5 to 15 gpfd and an over pressure of 10 500 psi. Total cost is estimated at $0.40/1000 g for a 1 MGD facility and $0.30/1000 gal for a MGD facility. (See also W70-08864). (Hancu Texas)

GENERAL SLUDGE CHARACTERISTICS,
Engineering-Science, Inc./Texas, Austin.
Davis L. Ford.
In: Water Quality Improvement by Physical a Chemical Processes, University of Texas Pres Austin, 1970. p 341-357.

Descriptors: *Sludge, *Sludge treatment, Sedime tation, Heat balance, Chemical properti Vacuum drying, Centrifugation, Sewage treatmen Identifiers: *Sludge characteristics, Thickenin Vacuum filter, Flotation, Specific resistance.

tabulation of physical and chemical sludge haracteristics as reported from various sources is mmarized. Settleability of a sludge is discussed th emphasis placed on the limitations of the set- ng rate parameters. Specific resistance and com- essibility coefficients are defined and these haractertistics are tabulated for various sludges. A rtial tabulation of caloric heat value of sludges mbined with moisture content and percentage olatile and inert material is given. Chemical alyses of sludges are presented to illustrate the otential usefulness as fertilizers. The concentra- n of sludge nitrogen, phosphorus and potash ntent as well as organic fraction indicate the fer- izer value. Sludges are also described with spect to unit process performance. Sludge con- ntration and dewatering processes of gravity ickening, vacuum filtration, centrifugation, and otation are considered. (See also W70-08864). lancuff-Texas)

HICKENING,
inois Univ., Urbana.
ichard I. Dick.
: Water Quality Improvement by Physical and hemical Processes, University of Texas Press, ustin, 1970. p 358-369, 7 fig, 18 ref.

escriptors: *Sludge, *Sludge treatment, *Sedi- entation, *Basin, Sewage treatment, Activated udge.
entifiers: *Thickening, Waste activated sludge, otation, Loading.

hickening is an important part of waste treatment stems because it accomplishes major sludge olume reductions at a low cost. Two basic types of ickeners are: gravity and flotation. Recent funda- ental advances in thickening have related mostly the gravitational type. The theoritical behavior sludges is relatively well understood and con- enient techniques are available for using nowledge of basic suspension settling properties r thickener design and for rational control of peration. Determining the required area and olume for thickening are interrelated. It is roposed that the area determination should be ased on a settling characteristic of the suspension hile volume determinations normally should be ased on the need for storing sludge during periods hen the solid feed rate exceeds the capacity of the hickener for passing solids. An illustrative problem presented and sample calculations are made to etermine the required area and volume for the hickening of 0.3 MGD of waste activated sludge rom an initial 2000 mg/l to 2% solids by weight. See also W70-08864). (Hancuff-Texas)

LUDGE FILTRATION AND SLUDGE CONDI- IONING,
exas Univ., Austin.
oseph F. Malina, Jr.
n: Water Quality Improvement by Physical and hemical Processes, University of Texas Press, ustin, 1970. p 370-387, 13 fig, 4 tab, 17 ref.

Descriptors: *Sludge, *Sludge treatment, Filtra- ion, Vacuum drying, Design, Sewage treatment, Waste water treatment, Acitvated sludge, Tem- erature.
dentifiers: *Vacuum filter, Sludge conditioning, Specific resistance.

The various factors which effect filtration of ludges can be catagorized in two major classes. The first characteristics of the sludge include: (1) hape and characteristics of solid particles in the ludge to be dewatered. (2) chemical composition f the sludge, organic or inorganic. (3) suspended olids content of the sludge (4) compressibility of olids in the sludge and (5) viscosity of filtrate and pecific resistance of the sludge. The first four of hese are fixed and very little can be done to alter hese characteristics. However, the viscosity of a iltrate as well as the specific resistance of the sludge can be altered by properly conditioning the sludge. Various aspects of sludge conditioning are presented and the effect of such conditioners as fly ash, newsprint, polymers and ferric chloride on specific resistance are presented. Results of this investigation show pulp newsprint at doses of 100-125% of the dry weight of the solids reduces the specific resistance of the activated sludge to a level equivalent to the minimum obtained with a cationic polymer with ferric chloride as a sludge conditioner. The effect of temperature on specific resistance of activated sludge was shown to have the least effect when utilizing pulp newspaper. The second category which effects filtration is the characteristics of the sludge dewatering system which include: type of filter medium used, size of pores, effects of solids, filter medium support, drainage system, operating pressure, contact time and final solids content of the cake. (See also W70-08864). (Hancuff-Tex)
W70-08891

CENTRIFUGATION,
Weston (Roy F.), West Chester, Pa.
J. H. Daugherty, and D. N. Bibbo.
In: Water Quality Improvement by Physical and Chemical Process, University of Texas Press, Austin, 1970. p 388-393, 1 fig, 2 tab.

Descriptors: *Sludge, *Sludge treatment, *Centrifugation, *Specification, Waste water treatment, Sewage treatment, Performance, Design, Activated sludge.

The three types of most widely used centrifuges in the field of waste water treatment are solid bowl, disc, and basket. Each perform one of three functions: clarification, classification or separation. Clarification is the process of removing the solids from a slurry phase where either the supernatant liquid or the solids are to be recovered. Classification is the process of removing solid particles of specific size from a liquid phase. Separation is the process of splitting a liquid into two fractions. In all three processes a difference in density must exist for the application to be feasible. In waste water treatment primary interest is in clarification or the removal of solids from a sludge or slurry, thereby reducing the volume for easier disposal. Centrifuges have been used extensively in the dewatering of primary, secondary and combined sludge and for oil recovery, slime sludge dewatering and by-products recovery. The solid-bowl machine is generally best suited for dewatering the solids involved in primary clarification. Centrifuges operating on primary sludge and achieving greater than 90% solids recovery have a cake discharge with a solids content of about 20 to 25%. Suggestions are given for specifications and information which may be presented to the equipment manufacturers when selecting a centrifuge for a specific use. (See also W70-08864). (Hancuff-Texas)
W70-08892

DISPOSAL OF SLUDGE ON LAND,
Texas Univ., Austin.
Ben B. Ewing, and Richard I. Dick.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970. p 394-408. 4 fig, 6 tab, 33 ref.

Descriptors: *Sludge, *Sludge disposal, *Fertilizers, Operations, Chemical properties, Diseases, Nutrients, Heavy metals, Costs.
Identifiers: *Landfill, Nuisances.

Sludge disposal on land may be applied as undigested primary, as excess activated sludge, or as digested sludge. It may be applied as a liquid or it may be dewatered or dried. The land may be used simply as a site for stockpiling sludge for storage. Sludge has long been applied to land for land improvement using the humus and the nutrients in the sludge for soil conditioning. Recently interest has been sparked in use of land application of liquid sludge as a means of sludge treatment and disposal. This practice also used the water for irrigation. If land disposal is compared with other sludge treatment and disposal costs instead of considering sludge in economic competition with chemical fertilizers as a means of increasing a crop production, it becomes economically attractive. Chemical composition of sewage sludge is also tabulated being broken down into total nitrogen varying from 1.81 to 5.96% total phosphate P2O5 varying from 1.16 to 6.97% total soluble K2O varying from 0.29 to 0.56% and ash varying from 27.7 to 61.4%. Odors, flies, and aesthetic degradation of the neighborhood seem to be the complaints most often voiced. Various costs are given including costs of transportation of sludge from the city by railroad tank car, tank truck, pipeline. In addition the cost of sludge disposal by various methods is presented for land application of liquid, digested sludge, dewatered sludge to landfill, fertilizer production, incinerator ash to landfill. (See also W70-08864). (Hancuff-Texas)
W70-08893

INTERRELATIONSHIP AND SLUDGE SEPARATIONS,
Texas Univ., Austin.
James Barnard, and W. Wesley Eckenfelder, Jr.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970. p 409-420, 6 fig, 7 tab, 12 ref.

Descriptors: *Sludge, *Sludge disposal, Mathematical model, Dewatering, Centrifugation, Vacuum drying, Sewage treatment, Waste water treatment, Industrial wastes.
Identifiers: *Interrelationships, *Sludge handling, Flotation, Thickening, Loading, Vacuum filter.

Increasing urbanization and decreasing land availability is placing increasing emphasis on concentration and dewatering of sludges for incineration or local land disposal. In order to attain the lease-cost solution for sludge treatment and disposal the interrelationships between treatment alternatives are of prime importance. Mathematical process models can be employed to relate cost to unit size, unit size to quality of product, and thus generate an optimization procedure for sludge treatment. The characteristics of a sludge vary with both the source, i.e., industrial or municipal and with the treatment process employed, i.e., physical, chemical or biological. These variations dictate the choice of treatment sequence. The major sludge treatment units discussed for the handling of primary and secondary sludge include flotation thickener, gravity thickener, aerobic digester, anaerobic digester, centrifuge, vacuum filter, drying beds, incineration, and land fills. The economics of each unit in the sludge treatment sequence has some effect on or is itself effected by other treatment units. The thickening of sludges prior to dewatering in a vacuum filter or centrifuge to treatment in biological units or to barging or piping to disposal has perhaps the highest benefit to cost ratio of all the units. Mathematical models are developed for flotation thickening, gravity thickening, sludge dewatering, centrifugation, and vacuum filtration. (See also W70-08864). (Hancuff-Texas)
W70-08894

EUROPEAN PRACTICES IN SLUDGE DEGESTION AND DISPOSAL,
Wolfgang A. G. Vater.
In: Water Quality Improvement by Physical and Chemical Processes, University of Texas Press, Austin, 1970, p 421-436. 11 fig, 3 tab, 11 ref.

Descriptors: *Sludge, *Sludge disposal, *Sludge digestion, Costs, Performance, Centrifuge, Vacuum drying, Dewatering, Incineration.
Identifiers: *Europe, Drying beds, Sludge handling, Pasteurization, Thickening, Vacuum filter, Filter presses.

European practices in sludge dewatering and disposal are discussed considering those aspects which differ from methods presently used in the United States. The differences between European

and American sludge disposal practices are primarily the result of cost differences. Power costs for municipal utilities is 2.5 cents/kw hr, current self-generated from digester gas 1.2 cents/kw3hr, fuel oil $0.10/gal, construction and installation costs for digesters is approximately $50/m3 and labor is about $4000/yr. Pasteurization prior to use on the soil is required if the sludge is to be used for improvement of the soil. Composting with refuse in which sufficient self-heating is generated is considered an effective heating of the liquid. Most sludge thickeners are tanks with circular cross sections. If they are not equipped with the scrapers the bottom is funnel shaped with sludge removal at the deepest point. Continuous decanter centrifuges are most commonly used. If no chemicals are added the recovery is 40-70% of solids from the raw sludge. The average vacuum filter rate is about 5 gal/sq ft and under favorable conditions up to 7.5 gal/sq ft for solids content of 10%. Of all available mechanical sludge dewatering equipment filter presses yield the greater possible cake solids content. The average performance is about 1 to 2.5 gal/sq ft with solids content of 10% and cake solids content of 40-60%. Sludge incineration yields the smallest possible final volume of any mechanical sludge handling method. Incinerators of the multiple hearth furnace and fluidized bed type are discussed. (See also W70-08864). (Hancuff-Texas)

THE UTILIZATION OF THIOCYANATE BY A HETEROTROPHIC BACTERIUM,
University Coll. of South Wales and Monmouthshire, Cardiff.
D. A. Stafford, and A. G. Gallely.
Journal General Microbiology, 55, Part 1, p 285-289, 1969. 3 fig, 8 ref.

Descriptors: *Activated sludge, *Biodegradation, *Incubation, *Isolation, *Assay, Dentrification, Inhibition, Phenol, Nitrogen.
Identifiers: *Autotrophs, Sterilization, Pseudomonad, Cellular nitrogen, Thiobacilli.

A heteorotrphic bacterium is isolated by plating out on a solid thiobacillus-enrichment medium. Characteristics of the organism given include: (1) rapid positive result in the oxidase test utilizing denitrification as an anaerobic respiratory mechanism. (2) no growth took place on nutrient agar at 4 over a period of ten days. (3) pigment is not produced under any conditions of growth. (4) the organism used thiocyanate as sole source of cellular nitrogen and sulfur. In the presence of excess thiocyanate, growth stopped suddenly whenever the carbon and energy source were exhausted. The organism fits the definition of pseudomonad. Characteristic features of the organism are its rough and smooth colonial variations. The potential use of the organism in the biological treatment of effluents is brought out by its ability to metabolize both phenol and thiocyanate simultaneously. (Radhakrishnan-Texas)

SEWAGE TREATMENT PLANTS,
Nebraska Univ., Lincoln.
Leon S. Directo.
Water and Sewage Works, Vol 116, No. 8, Aug 1969, p 289-296. 7 fig, 5 tab.

Descriptors: *Waste water treatment, *Sewage treatment, *Plants, *Organic loading, Biochemical oxygen demand, Trickling filter, Operation, Efficiency, Performance, Ponds, Stabilization, Lagoons, Sampling, Nebraska.
Identifiers: *Hydraulic loading, *Suspended solids, Aerated lagoon, Recommendations.

The purpose of the paper is to determine and compare organic and hydraulic loadings on each of the sewage plant components (selected in Nebraska) with design loadings and to evaluate the removal efficiencies of the plant components in terms of BOD and suspended solids (SS) and evaluate general operation of each treatment system. The evaluation program consists of three phases namely: preliminary office planning, field inspection, and actual field sampling and testing. A particular plant, plant A is discussed for its inability to produce a satisfactory effluent. The plant is being loaded with an organic load (from cheese factory) of about 4 to 5 times the design value. Alternative methods are recommended to eliminate the inefficiency. In the case of another plant, plant B, the loadings were found to be 50% of the designed value. The data obtained reflects climatic condition existing at the time of sampling. As regards plant C, which consists of aerated lagoon followed by stabilization pond, the overall removal efficiency was about 88% for BOD and 65.1% for suspended solids. For plant D a low-rate trickling filter, both hydraulic and organic loadings were below the design value. Plant E, a high-rate single stage trickling filter had overall removal efficiency of 85% for BOD and 99% for SS. (Shankar-Texas)

A STANDARDIZED PROCEDURE FOR THE DETERMINATION OF DEHYDROGENASE ACTIVITY IN SAMPLES FROM ANAEROBIC TREATMENT SYSTEMS,
Middle East Technical Univ., Ankara (Turkey).
G. Lenhard.
Water Research, Vol 2, No 2, p 161-167, February 1968. 7 fig, 1 tab, 19 ref.

Descriptors: *Denitrification, *Anaerobic digestion, Temperature, Sludge, Digestion, Activated sludge, Waste water treatment, Sewage treatment.
Identifiers: *Dehydrogenase activity, Biochemical process, Reaction time, TTC concentration, Standardized method.

The applicability was studied of the dehydrogenase activity method for assessment of anaerobic treatment systems activity. The biochemically active sludge used for the tests was taken from two anaerobic digesters, one in which the denitrification activity was high. The results showed that (a) the optimum pH is identical with that for aerobic activated sludge systems, (b) linearity exists between dehydrogenase activity and sample quantity on the one hand and time on the other for both strongly and weakly active sludges tested, (c) the optimum temperature is 37C which is the same in aerobic systems, and (d) the optimal, final triphenyl tetrazolium chloride (TTC) concentration is 0.1%. The dehydrogenase activity method originally developed for soils and solid waste materials is also applicable to the study of anaerobic treatment systems like the one demonstrated. In special cases of anaerobic fermentation, care should be taken to insure that triphenyl formazan (TF) formation is biochemical by testing for factors characteristic of enzyme kinetics. (Shankar-Texas)

THE RELATION BETWEEN SLUDGE VOLUME INDEX AND SLUDGE CONTENT IN THE ACTIVATED SLUDGE PROCESS,
Instituut voor Gezondheidstechniek TNO, Delft (Netherlands).
J. A. Somers.
Water Research, Vol 2, No 5, p 563-573, May 1968. 7 fig, 2 tab, 5 ref.

Descriptors: *Sludge, *Activated sludge, Sedimentation, *Sludge treatment, Sewage treatment, Waste water treatment.
Identifiers: *Sludge volume index, *Sludge content, Variation, Bulking sludge, Vessel diameter, Grain diameter, Flow velocity, Pore volume.

To characterize the sedimentation properties of activated sludge in the activated sludge treatment process, the determination of the sludge volume index (SVI) is important. Experiments were conducted in the oxidation ditch at Oudewater. A slow rise of SVI 45-55 to 70-90 was noted during the years 1962-1964. It is felt that the wide divergence may be due to inhomogeneities in the settling sludge mass and varying sludge qualities in t period of two years. Experimental methods we adopted to determine the SVI by artificially varyi sludge contents. The results from Oudewa showed that SVI increases as the sludge content creases. However, for the highest sludge content lower SVI was noted. Sludge from Sancta Ma (plant with bulking sludge) showed a differe result. In this case SVI was lower when the slud content was higher. Interpretation of the resu from different sludges pointed that the diameter the settling glass might influence SVI. (Shank Texas)

INSTRUMENTATION FOR HYDROGEN SU FIDE MEASUREMENTS,
Los Angeles Bureau of Sanitation, Calif.
William F. Garber, Joe Nagano, and Frank F. Wada.
Journal Water Pollution Control Federation, P II, R209-R220, May 1970, Vol 42, No 5. 10 fig, ref.

Descriptors: *Instrumentation, *Hydrogen sulfi *Measurements, *Analysis, Testing, Waste wa treatment, Sewage, Test procedures, Volumet analysis, Sewage treatment.
Identifiers: *Detection, Inorganic sulfide.

The generation and release of hydrogen sulfic with subsequent odor and corrision problems is factor of concern in almost all waste water systen but particularly in areas where organic strength high and average waste water temperatures exce 70 to 72 deg F. Although previous work provid considerable insight into the mechanisms of sulfi generation and release studies of these speci problems require extensive action and continuo testing capabilities. A number of sulfide te procedures have been developed over the yea Each of these has been of value under certain co ditions and in fact often satisfying needs for port bility, low initial cost and spot testing as well as t more sophisticated continous operation. Howeve in depth studies ultimately require accurate, aut mated continuous testing capability. For contin ous measurement a lead acetate tape an early co lometric instrument and the present coulomet instrument capable of both liquid and gaseo phase analysis has been examined. The improv automated lead acetate method has had wide a plicability where the concentration range was pr dictable, and specific reaction with hydrogen su fide was important; however, the current coulome ric method appears to be the most accurate. KITCHENER PRE-TREATMENT PLAN REDUCES CITY LOADING BY 20%,
Reid, Crowther and Partners Ltd.
R. R. Parker.
Water and Pollution Control, Vol 108, No 3, p 1 19, March 1970. 1 fig.

Descriptors: *Waste water treatment, Industr wastes, Flotation, Sedimentation, Screens, Far wastes.
Identifiers: *Meat packing wastes, Manur Kitchener (Ontario, Canada).

The J. M. Schneider, Ltd. operates a meat packi plant which kills and processes cattle, hogs, a poultry and produces both fresh and cook products. Its waste water streams total 1.4 MG with up to 27,000 lbs BOD, 20,000 lbs suspend solids, and 12,000 lbs ether solubles. The City Kitchener, Ontario requested this waste load reduced to 900 ppm BOD, 600 ppm suspend solids, and 200 ppm ether solubles, based on average of the consecutive 24 hour composite sa ples. The company installed two sewers, one co taining fat bearing waste water (95% of the to flow) and the other containing manure bearin wastes. Sanitary sewage and storm sewage go city facilities through existing lines. The fat bearin

stream is passed through a vibrating 1/4 inch mesh screen where large particles are removed. The effluent goes into an equalization tank and then into a combination flotation-sedimentation unit. Grease is removed by flotation, solids by sedimentation. Manure bearing wastes are screened on 100 mesh vibrating screens. Effluent from both streams goes to municipal sewers. Screenings are taken to landfill. The grease disposal problem remains unsolved. The units involved in both treatment plants are discussed in detail. The City of Kitchener treatment plant reported a 20% reduction in the loading on its plant after the meat-packing plant installed its own treatment plant facilities. (Makela-Texas)

ALGAL FLOCCULATION WITH ALUMINUM SULPHATE AND POLYELECTROLYTES,
New South Wales Univ., Kensington (Australia).
Michael G. McGarry.
Journal Water Pollution Control Federation, Part II, p R191-R207, May 1970, Vol 42, No 5. 6 fig, 4 tab, 14 ref.

Descriptors: *Algae, *Flocculation, Equipment, Costs, Separation techniques, Coagulation, Waste water treatment.
Identifiers: *Alum, Polyelectrolytes, Factorial design.

The high rate pond process is being developed to treat waste water and to provide a new source of edible protein in the form of algae. As a food production process, the yield of algae exceeds the yields of all currently known grain crops. Recent studies in Thailand have indicated that protein production rates of 25 tons/year/acre are quite easily acheived on a pilot plant scale. This yield compares favorably with that of wheat, 135 lb/year/acre and that of soy beans 576 lb/year/acre. Aluminum sulfate was tested as a primary coagulant in conjunction with a variety of polyelectrolytes for chemical flocculation as a means of harvesting the dispersed algae from heavily laden pond water. The independent variables studied were alum and polyelectrolyte concentrations, time of polyelectrolyte addition, fast and slow mixing period and degree of turbulence. Dependent variables considered were: supernatant transmission and settled volatiles as a measure of harvest of algae, after one hour of settlement. Cost of algal havesting by alum alone at concentrations of 30 mg/l would be prohibitive. The overall minimum cost per unit of algal yield was attained with alum along at dosage range of 75 to 100 mg/l of alum. (Hancuff-Texas)

AUTOMATIC ASSESSMENT OF RESPIRATION DURING GROWTH IN STIRRED FERMENTORS,
Shell Research Ltd., Sittingbourne (England).
Douglas W. Ribbons.
Applied Microbiology, Vol 18, No 3, p 438-443, Sept 1969. 8 fig, 19 ref.

Descriptors: *Respiration, *Fermentation, *Oxygen demand, *Dissolved oxygen suspensions, Environment, Methane, Viability, Growth chambers.
Identifiers: *Stirred fermentors, *Glucose limiting media, *Dissolved oxygen electrode, *Oxygen uptake, Thermotolerent bacterium, Gaseous exchange.

Continuous measurement of respiration during growth of microorganisms is a valuable information in understanding the growth culture. An apparatus for continuously recording respiration is described. All the other methods are briefly explained. A comparison of the present method is made with the other methods and the advantages are brought out. The apparatus is primarily used to investigate gaseous exchange that occurs during bacterial growth. Respiration of Escherichia coli, Pseudomonas aeruginosa, Bacillus Thuringiensis and Methylococcus capsulatus are measured during growth on complex and defined media. Results of the study of P. aeruginosa in ammonium limited media and glucose limited media are compared. Data obtained are not used for establishing any quantitative relationships but to understand the growth process. (Radhakrishnan-Texas)

AERATION ON AN INCLINED TRANSVERSELY CORRIGATED SOLID SURFACE,
Louisiana Polytechnic Inst., Ruston.
H. K. Huckabay, and Arthur G. Keller.
Journal of Water Pollution Control Federation, Part II, p R202-R208, May 1970. 4 fig, 10 ref.

Descriptors: *Aeration, *Mathematical model, Industrial waste, Sewage treatment, Waste water treatment, Corrigated metal, Aerator, Fluid dynamics, Inclination, Metal sheet.

Gravity flow down an inclined transversely corrigated solid surface appears to be a method of aeration deserving of wide-spread consideration. The experimental apparatus used in this study was corrigated galvanized iron with sinusoidal characteristics of 1.25 inches amplitude. The cascade board was varied from an inclination of 5 to 30 deg from the horizontal. The range of water temperature studied was from 28 to 42 deg C. Water flow rate was varied from 0.02 to 0.08 million gallons/day/foot width. By standard statistical techniques it was determined that K sub la, the coefficient of mass transfer, was a function of the angle of inclination and throughput and N sub t, the number of transfer units, was a function of the angle in inclination only. The transfer unit is independent of flow-rate and implys the ability of the cascade to undergo large-scale surges in volumetric input without a change in aeration performance. (Hancuff-Texas)

COMPARISON OF WASTE WATER SAMPLING TECHNIQUES,
Southwest Research Inst., San Antonio, Tex.
D. S. Tarazi, L. L. Hiser, R. E. Childers, and C. A. Boldt.
Journal of Water Pollution Control Federation, Vol 42, No 5, Part I, p 708-732, May 1970. 10 fig, 11 tab, 6 ref.

Descriptors: *Sampling, *Statistics, *Monitoring, Waste water treatment, Automation, Analytical techniques, Statistical method, Probability, Evaluation.
Identifiers: *Sampling techniques, *'T' tests, Grab samples, Waste water characteristics.

A significant difference exists between the data obtained by grab sampling and by flow-weighted composite sampling. The significance of these differences was mainly dependent on the following factors: (1) the overall time period for which the waste water is to characterize, i.e., whether daily or other time increments of pollution loading are to be determined, (2) the confidence levels desired, (3) the variability of both quality and quantity in the specific waste water stream, and (4) whether concentration levels or material transport rates are desired. A comparison is made between grab samples and weighted composites for several industries on the Houston ship channel. From past experience that the number of grab samples required to be equivalent even with 90% confidence limits to a flow-weighted composite is excessive for most of the waste water entering the ship channel. Two waste water streams were utilized in this demonstration. Daily composite and grab samples were taken from both flows. Analyses determined on the first included pH, total residue, filtered COD, TOD, total filtered carbon, and inorganic filtered carbon. The second stream included only total, filterable and non-filterable residues. The 'T' test is used to statistically analyze the collected data and develop confidence limits. (Hancuff-Texas)

SCUM INCINERATION EXPERIENCES,
East Bay Municipal Utility District, Oakland, Calif.
Elmer E. Ross.
Journal of Water Pollution Control Federation, Vol 42, No 5, Part I, p 733-736, May 1970. 1 fig, 3 tab.

Descriptors: *Scum, *Incineration, *Operation and maintenance, *Skimming, Sewage treatment, Waste water treatment, Sediments, Oil, Sludge disposal, Costs, Air pollution, California.
Identifiers: *Experiences, Gas analysis, Non-digestable, Gravity flotation, Oakland (Calif).

The East Bay Water Pollution Control system of Oakland, California is designed to give primary treatment to an average dry weather flow of 128 MGD and handle a maximum of 291 MGD. The treatment process consists of pre-chlorination, screening, grit removal, sedimentation, post-chlorination and sludge digestion. During the early years of operation it was found that the sedimentation tank scum which was then pumped to the digestion system with raw primary sludge contained appreciable amounts of petroleum oil, and other industrial wastes which were not readily digestible. This problem initially lead to the installation of a gravity flotation type thickener in which the raw skimming and digestion scum were concentrated and hauled to off-plant sanitary fills. The high cost of this method of disposal, in excess of $12,000 annually for hauling alone resulted in the installation in 1964 of an incineration plant. The 10.75 ft. 6-hearth unit is designed for 20 ton/day and automatic operation to minimize operator attention. To meet the air pollution control district standards the furnace was equipped with a Venturi-type wet scrubber and cyclonic separator. The heat value of the scum on a dry basis is between 14,000 and 16,000 BTU's/lb. Moisture content varied from 48.6% to 42.5% in 1968. The maximum temperature maintained within the furnace varies from 1500 to 1800 deg F. (Hancuff-Texas)

THE USE OF FLY ASH IN WASTE WATER TREATMENT AND SLUDGE CONDITIONING,
Cincinnati Univ., Ohio.
J. David Eye, and Tapan Kumar Basu.
Journal of Water Pollution Control Federation, Vol 42, No 5, Part II, p R125-R135, May 1970. 4 fig, 9 tab, 8 ref.

Descriptors: *Sludge, *Fly ash, *Waste water treatment, Sludge disposal, Sewage treatment, Filterability, Laboratory tests, Costs, Chemical oxygen demand.
Identifiers: *Sludge conditioning, Settleability, Suspended solids.

Fly ash is capable of reducing COD of a secondary effluent by about 30% at a fly ash concentration of about 1600 mg/l when the initial COD is around 60 mg/l. The removal of suspended solids containing fly ash by coagulation with lime is highly efficient. With an overflow rate of 330 gal/day/sq ft about 98% of the suspended solids were removed. Fly ash is a useful agent in conditioning sludge prior to vacuum filtration. Although fly ash has the great advantage of being very cheap and readily available in most industrial areas an additional initial expenditure is required for suitable mixing and feeding equipment for fly ash use in an existing plant using conventional methods of sludge conditioning. Characteristics of fly ash are presented and its usefulness described. It weighs 30 lb/cu ft, has a carbon content of 1 to 60%, a specific gravity of 2.1 to 2.55 and specific surface area of 2,970 and 6420 sq cm/gm. (Hancuff-Texas)

CLARIFICATION-ADSORPTION IN THE TREATMENT OF MUNICIPAL AND INDUSTRIAL WASTE WATER,
Calgon Corp., Pittsburgh, Pa.
D. G. Hager, and P. B. Reilly.
Journal of Water Pollution Control Administration, Vol 42, No 5, p 794-800, May 1970. 9 tab, 4 ref.

Descriptors: *Adsorption, *Waste water treatment, *Sewage treatment, *Activated carbon, *Costs, Industrial wastes, Performance, Biochemical oxygen demand, Reliability.
Identifiers: Requirements, Total organic carbon.

Over the last three years many laboratory and field evaluations have confirmed the technical and economic feasibility of treating raw municipal waste water with granular activated carbon after preliminary flocculation and settling to reduce suspended solids. Adsorption isotherm studies were conducted on raw waste water from 11 municipal plants located principally in Western Pennsylvania. The results of these tests are tabulated in terms of total organic carbon. The pounds of carbon required to treat waste water are shown as pounds per million gallons and indicate a wide range between 542 and 4280 for 90% TOC removal and between 572 and 5050 for 95% TOC removal. It is stated that the break even point when comparing economics of activated sludge and activated carbon is a carbon dosage of 300 to 1000 pounds per million gallons. A cost comparison is given between the activated sludge system for 10 MGD plant at 90% BOD removal and the clarification-adsorption process for 95% removal. The activated sludge plant construction cost is estimated at 3.883 million dollars as compared to 3.359 million dollars for adsorption-clarification plant. A summary of the operating costs of the two systems is tabulated. A total of $0.091/1000 gallons is presented for the activated sludge system and $0.107/1000 gallons for the clarification-adsorption system. Combining operating costs with amortization of capital the two systems are essentially identical amounting to $0.178/1000 gallons for activated sludge and $0.179/1000 gallons for clarification-adsorption. (Hancuff-Texas)

THE MANNING EQUATION AND BOUNDARY RESISTANCE,
Guelph Univ. (Ontario).
Peter S. Chisholm, and G. Tsang.
Journal of Water Pollution Control Federation, Vol 42, No 5, Part 1, p 753-757, May 1970. 2 fig, 7 ref.

Descriptors: *Sewers, *Manning's equation, *Variability, Evaluation, Pipes, Flow, Flow rates, Friction, Hydraulic gradient, Design, Reynolds number.

Contrary to Manning's (Trans. Inst. Civil Eng Ireland: 2021, 1889) original conclusions n is not a function of boundary roughness alone. Within the design range selected for illustration n increases with increasing conduit size and effective roughness and decreases with the Reynolds number. The selection of correct effective roughness value for design is important to correct assessment of boundary resistance to flow. Available data illustrate that effective roughness of concrete-walled conduit is between 1 and 2 orders of magnitude less than values often attributed to that material. For example, the roughness value recommended for concrete ranges between 0.001 and 0.01 feet. Available experimental data indicate that the range for pre-cast sewer pipe with average field joints is between 0.00015 to 0.00023 feet. Resistance to flow due to factors other than wall roughness must be accounted for in design; thus the values of n often are modified to account for both predictable and anticipated field conditions. OPERATOR DEVELOPMENT--PACIFIC NORTHWEST,
Washington State Water Pollution Control Commission, Olympia.
Russell K. Taylor
Journal of Water Pollution Control Federation, Vol 42, No 5, Part I, p 704-707, May 1970.

Descriptors: *Training, *Education, Operation and maintenance, Sewage treatment, Waste water treatment, Personnel, Permits
Identifiers: *Operators, *Certification, Incentives, Personnel development.

The Pacific Northwest has seen many changes and developments in the municipalities responsibility for maintaining water quality standards. The effects of these changes on water pollution control plant operators is evaluated and the outlook for the operator of tomorrow is assessed. Comments are made with reference to Washington State, but these comments reflect the activities in each state of the Pacific Northwest. In its solutions to the many problems associated with water pollution, Washington State Water Pollution Control Commission has adopted a regulation and a plan of implementation for interstate, intrastate, and coastal waters for the protection and maintenance of water quality in the State of Washington. In order to accomplish these goals, there is a need for training 490 pollution control plant operators by 1974. The training needs of the State of Washington exist in four areas: (1) Preparatory training, (2) Skill maintenance, (3) Skill improvement, (4) Emergency training. The operators of the State of Washington have participated in a voluntary certification program for several years and to date there have been 516 certificates of competency issued by the State Certification Board. Of these there are more than 400 active certificates held in industry. The Washington State Department of Health has drafted a mandatory certification bill for water works and for water pollution control plant operators which is anticipated to be considered by the 1971 legislature. (Hancuff-Texas)

AN EVALUATION OF THE STANDARD BIOCHEMICAL AND ELEVATED TEMPERATURE TESTS FOR DIFFERENTIATING FAECAL AND NON-FAECAL COLIFORMS,
Central Public Health Engineering Research Inst., Nagpur (India).
R. P. Mishra, S. R. Joshi, and P. V. R. C. Panicker.
Water Research, Vol 2, p 575-585, 1968. 4 tab, 29 ref.

Descriptors: *Coliforms, *Evaluation, *Laboratory tests, Sewage bacteria.
Identifiers: *Biochemistry, Differentiation.

The relative efficacies of the biochemical IMViC and the elevated temperature (FC) tests have been compared for differentiating the faecal and non-faecal coliforms. Altogether 1628 coliform strains comprised of 427 from 143 samples of human faeces, 301 from 101 samples of cattle faeces, 631 from 113 samples of sewage and 269 from 120 samples of soil were classified as to their IMViC types and response to elevated temperature reactions. Parr's Escherichia group (++--, +--- and -+--) was represented by 83 and 85% of the coliform strains isolated from human and cattle faeces respectively. Of the coliform strains isolated from human cattle faeces 82.0 and 76.4% respectively were found positive for the FC test. Neither the IMViC nor the FC tests by themselves can be considered adequate for differentiating coliforms of faecal and non-faecal origin. (Aguirre-Texas)

MANPOWER CRISES LEADS TO PROGRAMS FOR TRAINING POLLUTION-ABATEMENT TECHNOLOGISTS,
Charles County Community Coll., La Plata, Md.
Carl M. Schwing.
Water and Wastes Engineering, Vol 1, No 3, Mar 1969, p 56-58.

Descriptors: *Education, *Personnel management, Pollution abatement, Training, Waste water treatment, Maryland.
Identifiers: La Plata (Md).

Personnel at Charles County Community College, La Plata, Maryland, have developed a program to provide training for individuals in pollution abatement technology. The FWPCA has estimated a need for 18,500 trained waste water treatmen plant operators over the next five years, with an ad ditional 23,000 trained technicians. The colleg program includes: (1) an annual training course fo treatment plant operators already in the field, (2 professional seminars for operators, (3) a two-yea Associate of Arts degree in pollution abatemen technology leading to employment in supervisor or technicial positions in operating or regulator agencies or in industry. The facilities at the colleg include a $1.2 million science and technolog center housing classrooms and laboratories and computer. The college will have its own wast water treatment plant treating waste water from th college and surrounding community. This plant wi be used in the training courses. (Makela-Texas)

PHOSPHORUS REMOVAL FROM EFFLUENT IN ALUMINA COLUMNS,
Battelle-Northwest, Richland, Wash.; and Rober A. Taft Water Research Center, Cincinnati, Ohio.
Lloyd L. Ames, Jr., and Robert B. Dean.
Journal, Water Pollution Control Federation, Vo 42, No 5, Part II, p R161-R172, May 1970. 6 fig, tab, 20 ref.

Descriptors: *Phosphorus, *Columns, *Costs *Tertiary treatment, Effluents, Efficiencies, Ad sorption, Waste water treatment, Sewage treat ment.
Identifiers: *Alumina, Loading, Regeneration, Elu tion.

An alumina column treating a synthetic secondar waste water effluent was studied. Small 1.1-cm diameter by 8-cm-high columns were used for th study. The alumina adsorption phenomena ha been considered to be essentially a highly selectiv ion exchange process with phosphorus also in volved in a secondary adsorption reaction. At 10% breakthrough the throughputs for 10.3, 7.0 and 3. mg P/l in the standard influent were 900, 1400 an 1900 column volumes respectively. The competi tion or effects of other anions on phosphoru removal was of interest because large concentra tions of other anions could significantly lower th phosphorus capacity of the alumina. The sulphat ion was chosen to demonstrate the interfering ef fects on phosphorus capacity. The concentration o magnesium and calcium also showed marked ef fects on alumina column phosphorus capacity. Ad sorption on the alumina occurs partly as a calciu or magnesium phosphorus complex rather than simple phosphorus anion. Elution of phosphoru was accomplished with 8 column volumes of molar sodium hydroxide followed by 20 columns o wash water. Estimated treatment cost including fi tration for a 10 MGD plant is between 5 and cents/1000 gallons for secondary effluent contain ing 10 to 12 mg P/l. (Hancuff-Texas)

TECHNIQUES FOR ESTIMATING CONSTRUC TION COSTS OF WASTE TREATMEN PLANTS,
Oklahoma Univ., Norman.
Kanti L. Shah, and George W. Reid.
Journal of Water Pollution Control Federation, Vo 42, No 5, Part I, p 776-793, May 1970. 1 fig, 9 tab 18 ref.

Descriptors: *Construction, *Costs, *Waste wate treatment, *Sewage treatment, *Statistics, *Mathe matical models, *Regression analysis, Industria waste, Sampling, Design, Stabilization, Ponds Trickling filter, Activated sludge.
Identifiers: Variables, Primary treatment.

Regression equations based on statistica techniques have been developed for estimating th unit construction costs of municipal waste treat ment plants, both in terms of design flow and popu lation equivalency. Regional differences wer taken into account in analyzing the data and a reasonable combinations of variables which wer thought to affect cost were considered. Tw

methods have been used to develop equations; (1) by analyzing separately the data of each type of plant, and (2) by combining the data and using dummy variables for the type of treatment plant. 809 letters with questionnaire forms were mailed including 49 letters to state health directors; 563 were completed. Data on 102 primary treatment plants were obtained. The relationships between the variables: cost per million gallons and flow in mgd were derived. For stabilization ponds only 12 of 157 plants reported current performance of treatment. Sample size for the standard rate trickling filter was 67 and an equation is derived for estimating unit construction cost in terms of dollars per mgd. Data on 120 high-rate trickling filter plants were obtained. Activated sludge treatment plants had a sample size of 115. The data on standard rate trickling filter, high-rate trickling filter, and activated sludge plants were combined and regression analysis was made with a sample size of 304. Since the logarithmic transformation of the variables gave the best fit, dummy variables were used in this form of linear equation. (Hancuff-Texas)

IMPROVED SETTLING TANK EFFICIENCY BY UPWARD FLOW CLARIFICATION,
British Wedge Wire Co. Ltd., Warrington (England).
V. R. Sparham.
Journal of Water Pollution Control Federation, Vol 42, No 5, p 801-811, May 1970. 3 fig, 2 tab, 10 ref.

Descriptors: *Settling basin, *Efficiencies, *Performance, *Sewage treatment, Beds, Trickling filter, Waste water treatment, Effluent.
Identifiers: *Upflow clarifier, Suspended solids.

Settleability of suspended solids from biological treatment of waste water varies widely. Polishing processes should not be relied on to substitute for poor settlement tank performance, which should be improved to insure an acceptable effluent for polishing process. For best results settlement tanks fitted with upflow clarifier elements should have a high surface volume ratio. Use of upflow pebble bed clarifiers in many smaller existing horizontal flows final settlement tanks improves settled effluent quality by 50% at maximum flows of 1 cu m/sq m/hr. The use of a single layer of wire mesh nearly eliminates pebble bed backwashing operations and costs while improving settlement tank performance by 50% at fully treated flow rates of up to 1 cu m/sq m/hr. Wedge wire mesh used in conjunction with suitable plastic matrices can reduce the suspended solids in settled effluent by 90% at 1 cu m/sq m/hr fully treated flow, and by 70% at 3 cu/m/sq m/hr for limited periods. A typical bed is described as 6 inches of gravel of 0.250-0.375 inches in diameter suspended 12 inches below the top water level of a final sediment tank. These clarifying elements may be adopted for stabilizing hydroxide floc blankets or activated sludge blankets in conventional potable water and waste water treatment. (Hancuff-Texas)

SIMPLIFIED GRAPHICAL EVALUATION OF BOD CURVE CONSTANTS,
Jadavpur Univ., Calcutta (India).
Dipak Bagchi, and Nilay Chaudhuri.
Journal of Water Pollution Control Federation, Vol 42, No 5, Part II, p R136-R139, May 1970. 6 fig, 3 tab, 2 ref.

Descriptors: *Mathematical model, *Computers, *Computer program, Laboratory tests, Analyses, Evaluation, *Biochemical oxygen demand.
Identifiers: *Graphical methods.

The method suggested by Fujimoto (Journal Water Pollution Control Federation, Vol 36:69, 1964) for the evaluation of first stage BOD curve constants is further simplified. The reorganized BOD equation shows a linear relationship between y sub t (BOD exerted in time 't') and y sub t+h-y sub t where y sub t+h is the BOD exerted in time t+h and can be used to evaluate the parameters L sub o the ultimate first-stage BOD and k the rate constant. The value of L is obtained directly from the graph as the intercept of the line on the absicca. The graphical technique can be used for evaluation even when BOD data are collected at irregular intervals of time. Evaluation of L sub o and k utilizing a digital computer becomes handy when a great bulk of data is to be processed. (Hancuff-Texas)

EVALUATION OF A COMPLETE MIXING ACTIVATED SLUDGE PLANT,
Kansas Univ., Lawrence.
Ross E. McKinney, Henry H. Benjes, Jr., and James R. Wright.
Journal of Water Pollution Control Federation, Vol 42, No 5, Part I, p 737-752, May 1970. 10 fig, 1 tab, 19 ref.

Descriptors: *Activated sludge, *Data collections, *Performance, *Mathematical model, Design, Facilities, Operation, Biochemical oxygen demand, Biological treatment, Evaluation, Waste water treatment, Nebraska.
Identifiers: *Complete mixing, Suspended solids, Grand Island (Nebraska).

Although complete mixing activated sludge waste water treatment plants have been in operation for a number of years there has been a reluctance to use this modification, mainly because of a lack of understanding of the fundamental concepts of biological waste water treatment, and in part due to the lack of sufficient operational data to give engineers confidence in the results which could be expected. Results of a 2.5 year study to obtain operational data from the Grand Island Waste Water Treatment plant in Nebraska is presented. In 1969 the water water flow of 5 MGD was 86% of the expected 1995 flows and the BOD was 78%. The aeration tank has a 3.8 hour detention time, BOD5 loading of 116 lb/cu ft/day about 4000-5000 mg/l mixed liquor suspended solids and 560 cu ft of air/lb of BOD5 load. The final effluent had an average of 7 mg/l BOD5, 98% reduction, in 1969 with an average of 3 mg/l BOD5, 99% reduction, for a 2.5 month period in April, May and June of 1969. The aeration system operated satisfactorily with air flow rates as low as 400 cu ft/lb BOD5 with an oxygen transfer of 0.47 lb O2/lb BOD5. The low oxygen transfer rate resulted in greater production in activated sludge than in conventional activated sludge systems. Excessively long storage in primary and secondary sedimentation tanks created definite operation problems with the transfer of much of the organic load from the primary system to the aeration system. MODEL OF NATURAL DRAFT COOLING TOWER PERFORMANCE,
Federal Water Quality Administration, Corvallis, Oreg. Pacific Northwest Water Lab
Lawrence D. Winiarski, and Bruce A. Tichenor.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 96, No SA4, Paper 7461, p 927-943, August 1970. 11 fig, 2 tab, 7 ref, append.

Descriptors: *Cooling towers, *Thermal powerplants, *Mathematical models, *Computer programs, Evaporation, Heat transfer, Mass transfer, Water temperature, Thermal pollution, Water pollution control.
Identifiers: Natural draft cooling towers.

A method is developed for analyzing the performance of counterflow and crossflow natural draft cooling towers that does not assume saturated air at the top of the packing. Types of cooling towers and the principles of operation are considered. Simplified differential equations for the heat and mass transfer relations and the methods of integrating them for both counterflow and crossflow towers are given. A large number of integration steps is shown to be unnecessary. Equations for estimating the pressure losses in the tower are also given. Simplified flow charts using these integration schemes show how the computer program is used to evaluate tower performance. The computed performance of towers of various heights operating in moist and in dry conditions is shown. The effect of inlet water temperature is shown to be significant. Finally, the computed performance of a given tower with fixed inlet water temperature is shown as a function of relative humidity and dry bulb air temperature. (Knapp-USGS)

BULKING OF DAIRY WASTE ACTIVATED SLUDGE,
Agricultural Univ., Wageningen (Netherlands).
A. D. Adamse.
Water Research, Vol 2, p 715-722, 1968. 3 fig, 3 tab, 12 ref.

Descriptors: *Activated sludge, *Bacteria, *Dairy industry, Industrial wastes, Nutrient requirements, Oxygen requirements.
Identifiers: *Arthrobacter, *Bulking, *Sphaerotilus, Carbon-nitrogen ratio, Oxygen tension.

The phenomenon of bulking of a dairy waste activated sludge was studied in relation to known and estimated data concerning two types of microorganisms involved in the mechanism of bulking, vig. Sphaerotilus and Arthrobacter-like bacteria. Reduced oxygen supply, resulting from the high dissimilation rate of the carbohydrate fraction of the dairy waste, together with the ability to accumulate storage compounds and the discrepancy between the potential and actual C/N ratios of this waste, were considered to be the mainfactors in stimulating growth of Sphaerotilus, and thus to be responsible for bulking. Alteration of the nutritional conditions caused an improvement of the growth of Arthrobacter-like bacteria and this led to a pronounced relative suppression of Sphaerotilus, as a result of which the settling properties of the sludge were restored. ALL PARTIES CAN BENEFIT FROM JOINT MUNICIPAL-INDUSTRY TREATMENT,
Procter and Gamble Co., Cincinnati, Ohio. Corporate Environmental Control.
J. Floyd Byrd.
Water and Sewage Works, Vol 116, No 11, p IW14-IW21, November 1969. 2 fig.

Descriptors: *Wastes, *Water quality, *Economics, Biochemical oxygen demand, Efficiency Pollution abatement.
Identifiers: *Joint municipal-industry treatment, *Ordinance, Sewer tax, Flammable waste.

The technical aspects of joint treatment of wastes from many industries, commercial enterprises and house holds are discussed. In addition to the savings by a joint treatment operation, there are also many advantages: (1) Waste treatment is merely a sideline to industry's main effort of manufacturing and marketing a product, whereas combined treatment does the job effectively as they are done by the specialists. (2) Land availability is an important factor favoring combined treatment. (3) Domestic sewage contributes nutrients and dilution to industrial wastes, making them more amenable to degradation. The paper then refers to the suggested municipal sewer ordinance outlined in the Water Pollution Control Federation Manual of Practice No 3 entitled 'Regulation of Sewer Use.' The objectives of the municipal sewer ordinance are described and the requirements to achieve those objectives are discussed. The paper recommends that the chief engineer of the sewage treatment plant should be given enough discretionary powers to take care of unusual wastes. Certain wastes should not be banned automatically, just limit their quantities so as not to affect biological treatment adversely. The spirit of cooperation and mutual trust between municipality and industry must exist. (Shankar-Texas)

BACTERIA AND LAGOONS,
Department of Interior, Atlanta, Ga.
J. R. Franzmathis.
Water and Sewage Works, Vol 117, No 3, p 90-92, March 1970. 3 fig, 2 tab, 13 ref.

Descriptors: *Waste water treatment, *Stabilization, *Ponds, *Bacteria, *Coliforms, *Performance, *Lagoons, Effluents, Summer, Winter, Southeast U.S.
Identifiers: Fecal, Loading rates.

Waste stabilization ponds in the Southeast were sampled for effluent bacterial densities. It was found that single-cell ponds effluents did not meet the criterion set forth in the Report of The Committee on Water Quality Criteria which recommended an average not to exceed 2,000 fecal coliform per 100 ml. Three ponds of 2, 2.6 and 6 acreas, loaded at an estimated 16, 18 and 41 lb/acre/day, respectively were sampled and 593 analyses were performed during January and February 1968. The pond loaded at 41 lb/acre/day was sampled again in July and August 1968, and 184 analyses were performed. Average effluent fecal coliform density during the winter for all ponds was reported to be 56,000/100 ml. Results for the pond loaded at 41 lb/acre/day were 87,000 and 1,366,000/100 ml for winter and summer respectively. Limited sampling on larger ponds found an average fecal coliform density of 71,000/100 ml from an 8 acre pond loaded at an estimated 31 lb/acre/day, and 278,000/100 ml from two 36 acre ponds loaded at an estimated 26 lb/acre/day. It was recommended that controlled retention rather than uncontrolled average detention time must be the goal of design, if disinfection is not utilized. (Galwardi-Texas)

THE BIOLOGICAL TREATMENT OF CARBONIZATION EFFLUENTS--II. STUDIES OF THE INFLUENCE OF LIQUOR COMPOSITION,
British Coke Research Association, Chesterfield (England).
A. G. Ashmore, J. R. Catchpole, and R. L. Cooper.
Water Research, Vol 2, p 555-562, 1968. 4 fig, 3 tab, 1 ref.

Descriptors: *Biological treatment, *Industrial wastes, Activated sludge, Aeration, Investigations, Carbon, Coals.
Identifiers: *Carbonization effluents, *Liquor composition.

Studies of the influence of composition on the treatability of carbonization liquors have been made by determining their minimum period of aeration, in single-stage completely-mixed activated sludge systems. Using solutions of ammonium thiocyanate as the basic substrate, precise information has been obtained of the complex relationship between influent strength and rate of treatment. For ammonium thiocyanate alone, a stepwise relationship was observed between concentration and minimum period of aeration. The effect of the addition of 1000 mg/l of phenol was to modify this relationship to give a constant minimum of 30 hours for the range 300-1000 mg/l of CNS, reducing rapidly at lower CNS concentrations, thus illustrating the complex effect of dilution as found in liquor treatment. The inhibition due to the intractable permanganate value residue, present in biologically treated effluents, was conveniently simulated by addition of small amounts of oxidized catechol to the influent. The effect of these additions has been studied with synthetic solutions and with limed spent liquor, over a wide range of concentrations, and could be determined with a high degree of reproducibility. The results illustrate the profound influence of this type of inhibitor upon the economics of liquor treatment (Aguirre-Texas)

A BIOLOGICAL AND CHEMICAL STUDY OF SEVERAL ANEROBIC DIGESTERS,
National Inst for Water Research, Pretoria (South Africa)
J. P. Kotze, P. G. Thiel, D. F. Toerien, W. H. J. Hattingh, and M. L. Siebert.
Water Research, Vol 2, No 3, p 195-213, March 1968. 1 fig, 12 tab, 21 ref.

Descriptors: *Anaerobic digestion, *Biological properties, *Biological treatment, *Chemical properties, Analysis, Carbohydrate, Chemical analysis, Enzymes, Sewage treatment.

Biological and chemical analyses were carried out on several digesters operated on laboratory, pilot and full-scale. These digesters received a variety of substrates which included raw sewage sludge; industrial effluents, and a synthetic substrate. Hexose monophosphate sluent enzymes could only be demonstrated in very active digesters receiving substrates high in carbohydrate material. The glycolytic pathway, glyoxylic acid and citric acid cycles were found in all the anaerobic digesters analyzed. Enzyme activity tests revealed different stages of adaptation of a raw sewage digester adapted to a synthetic substrate. Digesters receiving different substrates showed characteristic enzyme activity patterns, but chemical analysis such as pH, alkalinity and volatile fatty acid content did not demonstrate any obvious differences between these digesters. WATER CONSERVATION AND REUSE BY INDUSTRY,
Texas A and M Univ., College Station. Environmental Engineering Div.
Robert L. Irvine, Jr., and William B. Davis.
Water and Wastes Engineering, Vol 7, No 1, p 17-19, January 1970. 3 fig, 4 ref.

Descriptors: *Water reuse, *Industries, *Conservation, *Cost analysis, Industrial wastes, Biological treatment, Management, Cost comparisons, Waste water treatment.
Identifiers: *Segregation of wastes.

The concept of water conservation and reuse was presented in order to promote industrial implementation of inplant water management programs. Industry has avoided such programs; assuming that the quantity and quality of its water supply have been and will be constant in time and space. Waste treatment and its associated cost seems to be generally feared. Cost analyses were presented that point out the economic benefits of conservation and reuse. In addition, procedures were described that increase the efficiency of biological waste treatment facilities. The segregation of waste streams was stressed. Also, with the implementation of conservation and reuse programs, the cost of waste treatment becomes part of the production scheme. (Galwardi-Texas)

CASUAL OBSERVATIONS OF PROTOZOA IN TERTIARY SEWAGE TREATMENT,
Illinois State Water Survey, Peoria, Ill.
Ralph L. Evans, and Davis B. Beuscher.
Water and Sewage Works, Vol 117, No 2, p 35-41, February 1970. 6 fig, 2 tab, 18 ref.

Descriptors: *Activated sludge, *Biological communities, *Biota, *Efficiencies, *Ecology, *Protozoa, *Tertiary treatment, Biochemical oxygen demand, Dissolved oxygen, Regression analysis, Retention, Sewage lagoons, Turbulence, Waste water treatment.
Identifiers: *Biological examinations, Biological activity, Suspended solids.

Observations were made of predominant fauna (protozoa) in a tertiary sewage treatment (TSP) complex interposed between the treated effluent of an activated sludge plant and the receiving stream, the Illinois River. The tertiary unit was preceded by an activated sludge process. A brief review of the ecology of activated sludge is presented. Results of the test showed that the average reductions based on about 260 samples, were 23% and 41% for BOD5 and suspended solids respectively. The regression equations developed, defining the probable relationships of suspended solids to BOD5 suggest that BOD5 reduction is not solely a function of the sedimentation of suspended solids. Biological activity did not appear to be beneficial. Predominant protozoa observed in the pond system were flagellates, while cilates were dominant in the aeration units. The average concentration of protozoa was greater than 2000000 organisms per liter with ciliates either absent or in concentrations less than 500000 organisms per liter. Because of the apparent advantage of the ciliated protozoa and the non-beneficial nature of the flagellates it may seem desirable to create condtions within a TSP to stimulate their productivity. Also a slight increase in DO might be beneficial. (Shankar-Texas)

WASTE WATER FOR GOLF COURSE IRRIGATION,
California State Water Resources Control Board, Goleta.
David L. Sullivan.
Water and Sewage Works, Vol 117, No 5, p 153-159, May 1970. 7 fig, 1 tab.

Descriptors: *Effluents, *Soil properties, *Irrigation, *Grasses, Biological properties, Bioindicators, Chlorination, Oil, Alkalinity, Disinfection, Sludge digestion, Reuse

The use was demonstrated of sewage treatment plant effluent for grass irrigation in a new city golf course. A project was designed to point out the advantages and disadvantages of effluent irrigation, to select a suitable grass, and to determine the feasibility of this course of action. A 4-acre plot in Ventura was chosen to conduct the study. The grasses chosen for the study were old orchard, sea side bent, and Kentucky blue grass. Secondary clarifier effluent from the East Side Plant was used rather than final effluent, so that any bacteriological effects could be studied at a higher level of concentration. About 5 million gallons of digested sludge were spread throughout the area in which the test plots were located. Three plots were chosen for irrigation with domestic drinking water and three for irrigation with treated effluent. At the end of the experiment no harmful effects of effluent irrigation could be noticed in the grace. Oils and grease in the effluent soil had no effect upon growth, since the detergents present dissolved the oils and fats. The tendency of alkalinity, chloride ion concentration and other items to change was of major concern to the study. Kentucky blue grass is not suitable for golf courses since it is very sensitive to salt concentrations. (Shankar-Texas)

PRACTICAL METHODS FOR DETERMINING SEWAGE FLOW FOR ALL COMMUNITIES,
Metropolitan Corp. of Greater Winnipeg (Manitoba).
R. M. Girling.
Water and Sewage Works, Vol 116, No 7, p 250-258, July 1969. 7 fig, 4 tab, 7 ref.

Descriptors: *Instrumentation, *Industrial wastes, *Sampling, Design criteria, Corrosion, Manholes.
Identifiers: *Stilling well, *Radioactive isotopes, *Average flow, *Parshal flume, *Municipal sewage syste, Regulators, Plumb bob.

Measurement of sewage flow rate has become an important aspect in practical sanitary engineering. Starting from the basic concepts of flow measuring devices, the reasons for the measurement of sewage flow rate are enumerated. Various methods of measurement and the corresponding measuring devices are briefly explained, with particular reference to sewage measurement. The circumstances under which a particular type of measuring device is used are explained. The limitations, possible errors while using and the advantages of each type of measuring device are briefly presented. A method for measuring flow rate at sewage pumping stations is also given. Problems are worked out to illustrate the ap

plication of various devices. (Radhakrishnan-Texas)

PHOSPHORUS REMOVAL--PAST, PRESENT, AND FUTURE,
Maine Univ., Orono; and Illinois Univ., Urbana.
Millard W. Hall, and Richard S. Engelbrecht.
Water and Waste Engineering, Vol 6, No 8, p 50-53, August 1969.

Descriptors: *Nutrients, *Phosphorus, Activated sludge, Chemical precipitation, Coagulation, Ion exchange. Land use, Waste water treatment.
Identifiers: *Phosphorus removal, Chemical-biological processes, Chemical sorption, Electrochemical method.

An economical, predictable and highly efficient process for removing phosphorus from waste waters has not yet been developed. Because of the varied nature of the problem, it is unlikely that a single removal method can be developed for application to all cases. For this reasons, research and development should continue on a variety of processes for phosphorus removal. Methods now being used and developed are: (a) chemical precipitation and coagulation, (b) chemical-biological processes, (c) chemical sorption, (d) electrochemical method, (e) ion exchange, (f) land application, and (h) activated sludge. The addition of lime to secondary effluent, followed by mixing, flocculation and settling can reduce the phosphorus concentration by 99% or more. Sludge disposal is the main problem. The most economical design for a chemical-biological phosphorus removal process should employ chemical treatment prior to biological treatment. The process is considered capable of removing 90 to 95% of total phosphorus from domestic sewage containing 13 to 17 mg/l P and estimated chemical costs of $8 per MG. A comparison of alternate phosphorus removal methods shows that these can range from electrochemical treatment giving 81 to 85% removal for $4 to 8 per MG to algal ponds giving 80 to 90% removal at a cost of $1100 to 1300 per MG. (Aguirre-Texas)

REGENERATION OF OXIDATIVE ASSIMILATION CAPACITY BY INTRACELLULAR CONVERSION OF STORAGE PRODUCTS TO PROTEIN,
Oklahoma State Univ., Stillwater.
K. C. Goll, and A. F. Gaudy, Jr.
Applied Microbiology, Vol 16, No 9, p 1352-1357, September 1968. 4 fig, 7 ref. FWPCA Grant WP 00325.

Descriptors: *Activated sludge, *Microbiology, *Oxidation, *Proteins, Biochemistry, Carbohydrates, Enzymes, Nitrogen, Sludge, Waste water treatment.
Identifiers: *Intracellular conversion, *Storage products, Endogenous respiration, Oxidative assimilation capacity, Substrates.

Previous studies have shown that the capacity of a heterogeneous microbial population for oxidative assimilation of glucose can be renewed by periodically subjecting the sludge to endogenous respiration in the presence of an exogenous source of nitrogen. Further study of this system led to a modification of the activated sludge process for nitrogen-deficient wastes. It was not known whether renewal of oxidative assimilation capacity was possible for substrates which required the presence of inducible enzymes or for substrates which were not carbohydrates. Studies with lactose and acetate as carbon sources were designed. Both carbon sources were removed under conditions of oxidative assimilation, and the storage products were converted into protein when the sludge was subjected to a period of endogenous respiration in the presence of an exogenous supply of ammonium sulfate. The 'regenerated' sludge exhibited a renewed capacity for oxidative assimilation, indicating that requisite inducible enzymes were not diluted out in the endogenous phase to a degree sufficient to hamper renewed oxidative assimilation capacity. A noncarbohydrate carbon source can be successfully removed from the medium with this process. In the case of acetate, the oxidative assimilation capacity after 'regeneration' was not fully restored to the initial level. (Aguirre-Texas)

GROWTH OF MIXED CULTURES ON MIXED SUBSTRATES I. CONTINUOUS CULTURE,
Massachusetts Inst. of Tech., Cambridge.
S. K. Chian, and R. I. Mateles.
Applied Microbiology, Vol 16, No 9, p 1337-1342, September 1968. 6 fig, 1 tab, 16 ref. WASA Grant NsG-496.

Descriptors: *Cultures, *Growth rates, Biochemistry, Coliforms, Microbiology, Pseudomonas, Waste water treatment.
Identifiers: *Mixed cultures, *Mixed substrates.

Continuous culture on mixed glucose-lactose or glucose-butyrate media inoculated with river water led to a population composed of a pseudomonad and a coliform. The glucose was used preferentially to the other carbon source, and the utilization of the secondary carbon source was greatly reduced at high growth rates. Significant amounts of acetate were excreted even though the cultures were limited by the carbon source, rather than by oxygen or other nutrients. At high growth rates, the pseudomonad dominated the population, whereas at low and moderate growth rates the coliform was dominant. A syntrophic relationship was shown by the fact that the pseudomonad could not grow alone on the glucose-butyrate medium. (Aguirre-Texas)

WASTE WATER LOAD EVALUATED AT A MULTI-PRODUCT ORGANIC CHEMICAL PLANT,
Atlas Chemical Industries, Inc., Wilmington, Del.
A. J. Morrissey, and S. A. LaRocca.
Water and Sewage Works, Vol 117, No 5, p 173-178, May 1970. 10 fig, 2 tab, 1 ref.

Descriptors: *Evaluation, *Industrial wastes, *Organic compounds, *Organic loading, *Waste water treatment, Activated sludge, Organic wastes.
Identifiers: *Multi-products.

Atlas embarked on a program to characterize the waste waters discharged from its Atlas Point plant. The program involved sampling all waste waters that the plant generated. Data on oxygen utilization with time for each of these waste water outfalls were obtained. The effect of these discharges on the receiving waters of the Delaware River was investigated. Production data were screened to determine if a relation between process losses and VOD1 discharged could be established. The production equipment within the plant was sampled to provide a basis for segragating cooling waters from other waste waters. Combining all of the waste water outfalls sampled during the outfall sampling program results in a total average flow of about 13,000 gpm. The analyses performed on ten of the plant's waste water outfalls concluded with deoxygenation constants (to the base e) ranging from 0.18 to 0.36. Ratios of VOD1 to BOD5 ranged from 1.19 to 1.67 and averaged 1.45. For the various station averages, pH varied from a low of 6.2 to a high of 8.8; COD from 100 to 14,500 mg/l, BOD5 from 50 to 9000 mg/l and VOD1 from 65 to 12,900 mg/l. Flows averaged in the range from 10 to 9900 gpm. (Aguirre-Texas)
W70-08967

THE EFFECT OF PSYCHODA ALTERNATA (SAY.), (DIPTERA) AND LUMBRICILLUS RIVALIS (LEVINSEN) (ENCHYTRAEIDAE) ON THE EFFICIENCY OF SEWAGE TREATMENT IN PERCOLATING FILTERS,
Water Pollution Research Lab., Stevenage (England).
N. V. Williams, and H. M. Taylor.
Water Research, Vol 2, No 2, p 139-150, February 1968. 19 fig, 3 tab, 18 ref.

Descriptors: *Effects, *Efficiencies, *Sewage treatment, *Trickling filters, Worms, Waste water treatment.
Identifiers: *Psychoda alternata, *Lumbricillus rivalis.

It is said that the macrofauna in trickling filters influence the efficiency of treatment by controlling the growth of film, thus reducing the tendency toward blocking. The present study was designed to establish the effect of the two types of macroinvertebrates, psychodid flies and enchytraeid worms, separately and in mixed populations, on the efficiency of trickling filters. Four groups of triplicate perspex filters were supplied with artificial sewage at a constant temperature of 15 deg C, one group being inoculated with psychodid larvae, one with enchytraeid worms, one with mixtures of flies and worms, and one being kept free as a control. The film in the control group grew rapidly and blocked the filter, causing ponding and producing anaerobic conditions. The efficiency of treatment, measured in terms of BOD and organic carbon removal, decreased from 90% to 40%, some of the carbon being removed by anaerobic decomposition. The two groups containing fly populations showed increased efficiencies (>90%) within 2 months of inoculation, with the larvae successfully controlling the film accumulations. The filter group containing worms achieved similar high treatment efficiencies, but not until 5 months after inoculation, the worm populations increasing more slowly because of longer development periods. (Aguirre-Texas)

FEDERAL GRANTS AVAILABLE FOR INDUSTRIAL POLLUTION CONTROL,
Federal Water Pollution Control Administration, Washington, D.C.
William J. Lacy, and Allen Cywin.
Water and Sewage Works, Vol 116, No 5, p 12-15, May 1969. 1 fig, 1 tab, 3 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Treatment facilities, *Research and development, *Costs, Pollution abatement.
Identifiers: *Federal programs, *Federal grants, Joint industrial-municipal treatment.

Federal water pollution control programs are described with emphasis being placed on the industrial research and development (R and D) program. The program's general objective is to provide each basic industry the demonstrated, developed, and evaluated technology for the abatement or prevention of water pollution. The R and D program involving research, development and demonstration consists of three components: an in-house effort, a grants program and a contract program. More than 80% of the monies available to the FWPCA for R and D are used in the form of grant and contract payments. Industry can now apply for grants which pay as much as 70% of a project cost up to $1 million. The sequence of review for grant proposals is outlined. Several industrial grants are described. Projected schedules of investments in waste treatment facilities by industry and generalized cost ranges for treatment processes for some industries are summarized. It is estimated that industrial waste treatment costs over the next five years will be $2.6 to 4.6 billion. Joint industrial-municipal treatment is another R and D program area. Grants may be awarded for as much as 75% of the estimated reasonable cost of the project while contracts may be awarded for up to 100% of the project cost. (Galwardi-Texas)
W70-08969

WASTE WATER TREATMENT FOR COMPLETE NUTRIENT REMOVAL,
Notre Dame Univ., Ind. Dept. of Civil Engineering.
Wayne F. Echelberger, and Mark W. Tenney.
Water and Sewage Works, Vol 116, No 10, p 396-402, October 1969. 6 fig, 8 ref.

Descriptors: *Waste water treatment, *Nutrients, *Pilot plants, *Nitrogen, *Phosphorus, Treatment facilities, Biological treatment, Activated sludge, Nitrification, Denitrification, Indiana.
Identifiers: Chemical treatment, Extended aeration, South Bend.

An integrated treatment scheme consisting of a combination of chemical and biological treatment methods designed for the concurrent removal of both organic and euthrophying pollutants was investigated. A flow diagram of the pilot plant treatment process was outlined. Soluble organic carbon was removed by a high rate activated sludge system followed by an extended aeration system for partial aerobic destruction of biological solids and conversion of all forms of nitrogen to nitrate. Metal ion addition, aluminum or iron was provided in the extended aeration system for phosphate precipitation and for enhancement of the flocculation and settleability of the micro-organisms. Removal of inorganic nitrogen was accomplished by passing the nitrified liquid through an anaerobic contact system that reduced the nitrate nitrogen to nitrogen gas. Methanol was used as a supplemental organic carbon source in the anaerobic contact reactor. Bried aeration of the denitrification reactor effluent released additional nitrogen gas and conditioned the microbial solids for improved settleability prior to ultimate discharge of the treated waste water. A vacuum filtration-incineration process appeared to be the most desirable for the treatment of excess sludge. (Galwardi-Texas)

U-TUBE OXYGENATION OPERATING CHARACTERISTICS,
New Mexico State Univ., Las Cruces.
R. E. Speece, and Jack L. Adams.
Proceedings Industrial Waste Conference, 23, p 195-212, May 1968. 17 fig, 1 tab, 1 ref.

Descriptors: *Aeration, *Oxygenation, *Performance, *Waste water treatment, Headloss, Dissolved oxygen, Water management (Applied), Water treatment.
Identifiers: *Oxygen transfer, *U-tube oxygenation, *Operating characteristics, Parameters.

Oxygen transfer to water is a vital process in water quality management. U-tube oxygenation appears to be the most economical oxygenation system available for saturating water, which is desirable in water and waste water treatment processes, river-oxygenation, reservoir oxygenation and fish hatchery operations. As much as 3000 lbs of oxygen per day per 1000 cu ft can be dissolved in a U-tube aerator. The system can be used in natural situations without outside power requirements for stream re-oxygenation where a small hydraulic head of 3 to 4 ft is available. The inherent advantages of U-tube oxygenation are: (1) a high oxygen transfer coefficient resulting from high rates of surface renewal, (2) a long contact time between the bubbles and the water, and (3) an increased dissolved oxygen deficit caused by increasing the saturation concentration due to the hydrostatic head pressurizing the bubbles. The experimental system used consisted of a 40 ft U-tube aerator supplied with compressed air. The variables considered consisted of air-water ratio, water velocity, diffused depth, U-tube depth, water flow rate, air flow rate, diffuser type and oxygen content of the bubbles. Depths of 40 ft or more and nominal water velocities greater than six fps are favored for the design of a U-tube system. In cases where air is injected, minimum diffuser depths are best. (Galwardi-Texas)

THE RELATIONSHIP OF FLOW CHARACTERISTICS TO CHANGES IN SLUDGE CONSISTENCY,
John Hopkins Univ., Baltimore, Md.; and National Council of the Paper Industry for Air and Stream Improvement, Inc.
William L. Carpenter, and Jack Grossman.
Proceedings Industrial Waste Conference, 23, p 680-690, May 1968. 3 fig, 9 tab, 14 ref.

Descriptors: *Industrial wastes, *Sludge, *Flow measurement, *Flow characteristics, *Flow resistance, Velocity, Headloss, Reynolds number, Pulp wastes, Pulp and paper industry, Waste water treatment.
Identifiers: *Paper mill, Solids content, Fibre content.

The effect of solids concentration, velocity and fibre content of representive paper mill sludges were examined to determine their relationship to pipeline head losses. Nine paper mill sludges representing the major types resulting from mill processes and degree of treatment were selected. The equation of Behn was used to describe the non-Newtonian flow anticipated for the sludges. The fibre content of paper mill sludges was shown to be the single most important factor controlling head loss. At high velocities, sludges containing low fibre or solids content had greater head losses than sludges of high fibre or solids content. A relative change in velocity above three fps produces less relative change in head loss with sludges of high solids or fibre than occurs with sludges of low solids or fibre content. Fibre content ranged from 5 to 61%, solids content ranged from 0.5 to 4.2% and velocities ranged from 0.5 to 10 fps during the experiments. Biological sludges produce greater head losses than primary sludge of corresponding solids and fibre content. (Galwardi-Texas)
W70-08972

PURIFICATION OF STARCH INDUSTRY WASTE WATER,
Carl F. Seyfried.
Proceedings Industrial Waste Conference, 23, p 1103-1119, May 1968. 12 fig, 2 tab, 12 ref.

Descriptors: *Industrail wastes, *Treatment facilities, *Biochemical oxygen demand, *Activated sludge, Performance, Efficiencies, Rice, Potatoes, Wheat, Waste water treatment.
Identifiers: *Starch industry, *Germany, *Characteristics, *Flow diagram, Iron sulphate, Extended aeration.

Treatment systems utilized in Germany for the treatment of starch industrial waste water are described. Water consumption of the starch industry in producing 250,000 tons/year of starch is estimated at 2.64 billion gal/year. Pollution by the starch industry equals more than one million population equivalents per working day. Flow diagrams and waste characteristics of plants producing maize, potatoes, wheat and rice starches are summarized. Spray irrigation of waste water of up to 300 mm/year with a concentration of 220 lb BOD5/acre/day is carried out in a large number of smaller factories. Pilot plant studies showed that an activated sludge system could be used in the treatment of starch wastes but that the addition of iron sulphate was required to lower the sludge volume index. At present a full scale activated sludge system is treating 0.63 MGD of a combined maize and rice starch waste with a BOD5 removal efficiency of 97% at a loading of 2.5 kg/cu m/day. Digester supernatant liquor is utilized instead of iron sulphate as a loading agent for the sludge. For the treatment of potatoe and wheat starch waste waters the double-stage activated sludge process yields better results than the single stage and complete treatment can be achieved only at a very low sludge loading and extended aeration. (Galwardi-Texas)

WHAT THE WASTE WATER PLANT ENGINEER SHOULD KNOW ABOUT CENTRIFUGES,
Pennwalt Corp., Warminster, Pa.
Joseph R. Townsend.
Water and Wastes Engineering, Vol 6, No 11, p 42-44, November 1969. 4 fig, 2 tab.

Descriptors: *Waste water treatment, *Centrifugation, *Performance, Capital costs, Activated sludge.
Identifiers: *Tubular bowl, *Disc, *Decanter, *Solid-bowl basket, Parameters.

The use of centrifuges in waste water treatment has increased significantly in recent years. The principles of centrifugation and the capabilities of four types of centrifuges, tubular bowl, disc, decanter, and solid-bowl basket were discussed. The following parameters were presented for each type of centrifuge, bowl diameter, flow rate, solids infeed, discharged solids, temperature range, pressure range, speed, gravity, motor power required and size of particles removed. Relative performances of the disc, decanter and solid-bowl basket centrifuges on a municipal activated sewage sludge were presented. On the assumption that an 85% recovery of particles in an activated sludge was satisfactory, the capital costs were calculated. The disc centrifuge was found to have the lowest cost per unit capacity. For maximum sludge concentration, the basket type was found to be superior while the decanter centrifuge was found to be potentially economical only when used with chemical treatment. METHODS OF CHARGING FOR THE RECEPTION, TREATMENT AND DISPOSAL OF TOXIC WASTES,
Upper Tame Main Drainage Authority, Birmingham (England).
N. Harkness
Water Pollution Control, Vol 69, No 3, p 314-320, 1970. 1 fig, 2 tab, 27 ref.

Descriptors: *Control, *Disposal, *Biological treatment, *Toxicity, *Sewage treatment, Biochemical oxygen demand, Biodegradation, Oxygen demand, Pilot plants, Waste water treatment.
Identifiers: Treatability factor, Oxygen uptake.

The methods for the determination of charges for the acceptance, treatment and disposal of toxic wastes are discussed. For the reception of wastes into sewers the methods are likely to be similar to those used for other wastes. The purpose is to determine the effect of toxic wastes on the treatment of sewage and to assesss the costs of accomodating toxic wastes at the works. In the experimental examination of treatment of toxic wastes the main consideration must be the quality of the effluent produced. Small scale experimental treatment plants have provided a basis for determining the effect of toxic wastes on the treatment of sewage taking into account adaptation to the waste, reduced purification of sewage due to toxic effects, and the additional treatment of biodegradable constituents. In situations where pilot or laboratory treatment unit experiments are not warranted, then consideration of oxygen uptake by sewage with and without toxic wastes, and if appropriate, the organic content of the toxic waste relative to sewage, may provide a basis for determining a charge for acceptance of toxic wastes. TRISODIUM NITRILOTRIACETATE AND ALGAE,
Ontario Water Resources Commission, Toronto.
A. E. Christie.
Water and Sewage Works, Vol 117, No 2, p 58-59, February 1970.

Descriptors: *Algae, *Activated sludge, *Toxicity, *Laboratory tests, Detergents, Waste water treatment.

Identifiers: *Trisodium nitrilotriacetate, *Chlorella pyrenoidosa, Source of nitrogen, NTA.

The relationships between trisodium nitrilotriacetate, a potential detergent builder, and the algae Chlorella pyrenoidosa were investigated, in an acclimated activated sludge system, with respect to toxicity and as a source of nitrogen both before and after treatment of the material. It was reported that trisodium nitrilotriacetate is non-toxic to fish at concentrations up to 100 mg/l, to mammals fed up to several thousand milligrams per kilogram body weight, and non-irritating to human skin. Results indicated that NTANa3 at concentrations up to 275 mg/l was not toxic to the test organism Chlorella pyrenoidosa and could act as a source of nitrogen for algal growth, although, not to the same extent as equivalent quantities of nitrogen, fed as nitrate, under the same test conditions. Treatment of 275 mg/l NTANa3 by an acclimatized activated sludge system did not reduce the algal growth potential of the chemical. The feasibility of using biodegradable organic materials which contain neither nitrogen or phosphorus as detergent builders should be thoroughly considered. (Galwardi-Texas)

HEAT TREATMENT OF SEWAGE SLUDGES,
University Coll. of South Wales and Monmouthshire, Cardiff. Dept. of Mechanical Engineering.
R. B. Brooks.
Water Pollution Control, Vol 69, p 221-231, 1970. 11 fig, 6 tab, 8 ref.

Descriptors: *Heat treatment, *Sewage sludge, *Chemical oxygen demand, Dissolved solid, Biological treatment, Additives, Solvent extraction, Evaporation, Nitrogen, Ammonia, Sewage treatment, Waste water treatment.
Identifiers: *Liquor, *Full scale plant, *Laboratory treatment, Calorific value.

The object of the work was to obtain data which could be used to predict both the degree of sludge conditioning and the type of liquor produced from a variety of sludges in a full-scale plant. A comparison is made between laboratory and full-scale treatment. The laboratory results were similar in all respects to those of full-scale operation. Comparison of activated sludges from different localities conditioned to the same extent gave similar liquors when heat treated. The concentrations of individual components in a heat treatment liquor increased in proportion to the feed solids concentration. The COD was related to the dissolved solids (DS) by the relationship COD=1.234 + 2026 (mg/l). The organic N content of heat treated liquor was proportional to the DS, there being one relationship for activated sludge and others for humus, primary, activated and digested sludges. The production of ammonia N as a percentage of the total soluble nitrogen, increases with reaction temperature and holding time. Reference is made to the use of activated carbon, coal, and additives. The calorific value of heat treated sludge was slightly higher than that of untreated sludge. Calculations have shown that all the potential heat is recovered from a sludge. A 3% sludge feed could produce a thermally self sustaining process. (Shankar-Texas)

METABOLISM OF SUSPENDED MATTER IN ACTIVATED SLUDGE TREATMENT,
Nagoya City Water Works and Sewerage Bureau (Japan).
Shunzo Takahashi, Toshihiko Fujita, Michio Kato, and Takashi Saiki.
Advances in Water Pollution Research, Proceedings, Fourth International Conference on Water Pollution Research, Sec II, Paper 3, Prague, Apr 21-25, 1969, London, Pergamon Press, 1969, p 341-360, September 1968. 12 p, 8 fig, 4 tab, 11 ref.

Descriptors: *Activated sludge, *Biological treatment, *Metabolism, *Suspended load, Adsorption, Bacteria, Colloids, Effects, Waste water treatment, Sewage treatment.
Identifiers: *Suspended solids, Mixed liquor suspended solids, Soluble matter.

The purification mechanism of sewage by activated sludge is classified into: (a) removal and metabolism of suspended and colloidal matters; (b) adsorption, absorption, and metabolism of soluble matter. Although much work has been done on the latter, very little is known about the metabolism of the former. The proportion of suspended and colloidal organic matter in the toal organic matter in sewage is high; 60% of the total volatile solids and 76% of the total COD of raw sewage is contributed by this fraction. The results described show that under the condition of 4000 mg/l MLSS, and feeding every 4 hours, proteinaceous suspended matter (4 microns - 1 micron) was metabolized by 42% during 20 hours. Proteinaceous suspended matter (60 microns - 4 microns) was metabolized by 30% during 20 hours. Proteinaceous suspended matter (2mm- 60 microns) was hardly metabolized during 20 hours. The adsorption activity of activated sludge was decreased by adsorption of colloids and was recovered by metabolizing these colloids and bacterial growth. Suspended matter did not inhibit the adsorption or absorption of soluble matter by activated sludge. Soluble matter was not released into the liquid phase by metabolizing suspended matter. Suspended matter accelerated the metabolism of soluble matter by activated sludge. The effect of soluble matter on the metabolism of suspended matter depended on the soluble substrate and the condition of the activated sludge. Both bacteria and protozoa metabolize suspended matter. NUTRIENT REMOVAL FROM SEWAGE EFFLUENTS BY ALGAL ACTIVITY,
National Inst. for Water Research, Pretoria (South Africa).
J. Hemens, and G. J. Stander.
Advances in Water Pollution Research, Proceedings, Fourth International Conference on Water Pollution Research, Prague, Apr 21-25, 1969, London, Pergamon Press, 1969, p 701-716.

Descriptors: *Algae, *Hydrogen ion concentration, *Nutrients, *Tertiary treatment, Biological treatment, Nitrogen, Phosphorus, Sewage effluents.
Identifiers: *Algal activity, *Nutrient removal.

Results obtained in removing nitrogen and phosphorus from sewage effluent based on a modification of the methods reported by other workers is described. The results suggest that instead of attempting to remove nutrients from sewage effluent by assimilation into new algal cells it may be more practical, under suitable climatic conditions, to exploit the effects of pH increase due to algal photosynthesis and to avoid the problems of light utilization by dense algal cultures. The basic requirements for this system would be a level of photosynthesis sufficient to produce the pH increase required to precipitate phosphate and to promote loss of ammonia to the atmosphere. The decrease in ammonia and phosphate removal observed during the night might be overcome by the provision of sufficient fluorescent light above the experimental discs to lessen the pH decrease. Alternatively, pH control by the addition of alkaki might be possible, particularly since it was observed that the reduction in alkalinity during daylight reduced the amount of lime required to reach a pH of 10.3 by as much as 75% when compared to that necessary to achieve the same increase in the untreated effluent. (Aguirre-Texas)

LINEAR SUBSTRATE REMOVAL IN THE ACTIVATED SLUDGE PROCESS,
Texas Univ., Austin.
Lial F. Tischler, and W. Wesley Eckenfelder, Jr.
Advances in Water Pollution Research, Proceedings, Fourth International Conference on Water Pollution Research, Prague, April 21-25, 1969, London, Pergamon Press, 1969, p 361-384.

Descriptors: *Activated sludge, *Kinetics, Biological treatment, Chemical oxygen demand, Cultures, Organic matter, Rates, Sewage treatment, Waste water treatment.
Identifiers: Linear substrate removal, Soluble substrate.

Removal of mixtures of various simple organic compounds was investigated using mixed biological cultures in an effort to predict the kinetics of the activated sludge process. The simple organic compounds glucose, phenol, and analine were all removed linearly (zero order) by an activated sludge acclimated to a mixture of the compounds. Variation of the initial concentration of each compound had no effect on the removal rate of the compound by a given sludge. The removal rates of the compounds in a unit containing a mixture of the three, were the same as the rates found when each compound was tested alone. This indicates that different types of organisms may be responsible for the removal of each simple substrate. The predominant type of microorganism present in the continuous activated sludge unit was determined by the organic loading level on the unit. A filamentous sludge, found at higher loadings, was capable of assimilating glucose and phenol at significantly greater rates per unit biological solids than the flocculant sludges found at low and intermediate organic loadings. The linear removal rate for each compound increased linearly with increasing biological solids concentration. Overall organic removal, as measured by COD or TOC from a mixture of three or five linearly-removed simple compounds by an activated sludge acclimated to these compounds is actually a summation of the removals of each of the simple compounds. The removal of these mixtures can approximate first order kinetics. (Aguirre-Texas)

THE SUCCESSION OF MICROBIAL PROCESSES IN THE ANAEROBIC DECOMPOSITION OF ORGANIC COMPOUNDS,
Hydraulic Research Inst., Prague (Czechoslovakia).
Jiri Hausler.
Advances in Water Pollution Research, Proceedings, Fourth International Conference on Water Pollution Research, Prague, April 21-25, 1969, London, Pergamon Press, 1969, p 407-426.

Descriptors: *Anaerobic digestion, *Metabolism, *Organic compounds, Acid bacteria, Anaerobic bacteria, Bacteria, Biological treatment, Fermentation, Methane bacteria, Waste water treatment, Sewage treatment.
Identifiers: *Microbial processes.

In the biological methane production, it was assumed that methane and carbon dioxide resulted from the fermentation of cellulose due to the activity of only one species of microorganism-Bacillus omelianskii. Later it was shown that the production of methane is the result of complicated microbial processes occurring in several stages. Insufficient attention seems to have been paid to the succession of these microbial processes of methane digestion. In industrial wastes with a high carbohydrate content (more than 2 g/l), butyric fermentation predominates during the first stage of methane digestion. Acetic and butyric acids are produced as well as CO_2 and CH_4 in the ratio of 1:1. In the second stage the main products are acetic, propionic and butyric acids. In this stage three successive characteristic processes can be observed: (a) The butyric acid is decomposed by beta-oxidation to acetic acid. (b) Acetic acid is decomposed mainly by Methanosarcina methani to CO_2 and CH_4. (c) The last step is the degradation of propionic acid to acetic acid. This process is due to the activity of Methanobacterium propionicum. The acetic acid is then further decomposed to CO_2

and CH4. A new method for anaerobic treatment of industrial wastes with high carbohydrate content is suggested. The method is based on the fact that the whole process follows a natural succession divided into several physiological stages, with each stage taking place in a separate digester thus preventing antagonism between the specific species of microorganisms. After the acid digestion, the effluent must be neutralized with lime. (Aguirre-Texas)

THE PATHWAYS OF PHOSPHORUS IN BIOLOGICAL TREATMENT PROCESSES,
California Univ., Berkeley.
David Jenkins, and Arnold B. Menar.
Advances in Water Pollution Research, Proceedings, Fourth International Conference on Water Pollution Research, Prague, April 21-25, 1969, London, Pergamon Press, 1969, p 677-700.

Descriptors: *Biological treatment, *Phosphorus, Metabolism, Nutrients, Phosphates, Waste water treatment, Sewage treatment, Detergents.
Identifiers: *Pathways, *Phosphorus removal, Mechanisms, Sources.

In a residential community the synthetic detergent contribution to raw sewage phosphorus is between 60-67%. In primary sedimentation phosphorus removal is between 5-15%. The primary sludge contains between 0.61 and 0.72% P on a dry weight basis. Activated sludge from systems with organic removal rates in the range of 0.1-42.5 lb COD/lb VSS/day contained 2.62% P on a volatile solids basis. From a determination of the yield, endogenous decay rate, sludge phosphorus content and variation of removal efficiency with loading it was concluded that phosphorus removal by biological means would always be 20% or less for an influent phosphorus concentration of 9 mg/l P. At low loadings the phosphorus removal would be less than 20% because of the increased significance of endogenous respiration in determining the net growth in the system. Chemical precipitation as a calcium phosphate followed by sorption on the activated sludge floc has been suggested as a mechanism for the enhanced phosphorus removal observed at plants such as San Antonio, Texas. The equilibrium phosphorus content of sewages could be accurately predicted by assuming the precipitation of CaHPO4 (K sub sp = 2.2 x 10 to the minus 7th power). (Aguirre-Texas)

THE INFLUENCE OF INCREASED TEMPERATURES (30-39 DEG) ON THE BIOCOENOSIS OF ACTIVATED SLUDGE AND THE INTENSITY OF DECOMPOSITION OF ORGANIC COMPOUNDS,
C. Rogovskaya, M. Lagareva, and L. Kostina.
Advances in Water Pollution Research, Proceedings, Fourth International Conference on Water Pollution Research, Prague, April 21-25, 1969, London, Pergamon Press, 1969, p 465-476.

Descriptors: *Activated sludge, *Effects, *Temperature, Biodegradation, Biological treatment, Industrial wastes, Organic compounds.
Identifiers: Biocoenosis.

The influence of increased temperatures of the medium was studied considering the following factors: (1) the biochemical oxidation of organic compounds which are often found in industrial wastes-formaldehyde, acetone, and phenol; (2) the composition of the microfauna of activated sludge and its microflora according to physiological groups and the identification of bacteria; (3) activated sludge yield; (4) sludge index; (5) settlement of the suspended matter in the secondary sedimentation tank; (6) nitrification; and (7) the air used when the concentration of dissolved oxygen in the secondary sedimentation tank was 2.5-3.0 mg/l. The purification of industrial wastes under increased temperatures (up to 39 deg C) is possible. An increase in temperature causes the size of the bacterial cells and the specific composition of microflora and microfauna to decrease. The adaptation of bacteria to increased temperatures was slower than the adaptation to toxic compounds. The optimal temperature for nitrifying bacteria was 30-35 deg C. With an increase in temperature the number of microfauna species of the active sludge decreased (from 21 species at 20 deg C to 4-5 at 39 deg C). The growth of sludge decreases with an increase in temperature (sludge treating 600 mg/l formaldehyde) at 32 deg C did not produce excess sludge. With a rise in temperature the sludge index had a tendency to increase (from 56 ml/g at 20 deg C to 93 ml/g at 39 deg C). Wash-out of suspended particles from the secondary sedimentation tank was inconsequential at all temperatures studied, but it tended to decrease with a rise in temperature. The biochemical activity of sludge increased with a rise in temperature (0.916 g BOD removed per gram of sludge/day at 39 deg C and 0.597 g at 20 deg C). (Aguirre-Texas)

WATER SUPPLY AUGMENTATION BY REUSE,
Utah Water Research Lab., Logan.
David W. Hendricks, and Jay M. Bagley.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 247-259, 1969. 5 fig, 1 tab, 6 ref.

Descriptors: *Water reuse, *Water resources development, *Planning, Water yield improvement, Water supply, Conjunctive use, Reclaimed water, Water conservation, Water treatment, Water utilization, Water demand.
Identifiers: Water recycling.

Development of water supplies should include considerations of recycling as an intensive option to be thoroughly explored prior to adoption of an extensive option, usually large scale transport. The potential of recycle is examined as a formal option in water resources planning. Major emphasis is on the conceptual aspects of recycle in the water planning context; the concept is illustrated by means of a case study for an arid region having both large non-consumptive and large consumptive diversions. 5F. Water Treatment and Quality Alteration

REVERSE OSMOSIS CAN CUT COST OF WATER TREATMENT,
Gulf General Atomic, Inc., San Diego, Calif.
J. H. Meyers.
Industrial Water Engineering, Vol 7, No 3, p 25-30, March 1970. 3 fig, 4 tab.

Descriptors: *Optimization, *Design, *Economic feasibility, *Reverse osmosis, *Water treatment, *Costs, Water quality control, Demineralization.

The mass production of uniform-quality membranes was said to be the main item responsible for the popularity and competitiveness of installation of industrial reverse osmosis. The membrane as the heart of the RO system had the characteristics of permitting the passage of water while acting as a barrier to the passage of dissolved or suspended solids. Long-term performance was basic to the value of the reverse osmosis system and it was important that the total installation, including pretreatment, be designed for optimum performance and high availability. In-plant experience gathered over the past two years served as a basis to help insure good overall design and determine economic feasibility. The primary factors that determined performance of reverse osmosis were: (1) applied pressure; (2) concentration of the dissolved solids in the feed; (3) temperature of the feed; and (4) the porosity or permeability of the membrane. To assure optimum performance over long periods the feed was pretreatd by filtration and chemical addition. The major use for reverse osmosis was for the production of high-purity demineralized water. The application offered flexibility in producing water of many qualities for various plant requirements. The components of the RO system installation were described. The capital and operating costs of reverse osmosis equipment decreased significantly as size increased. Typical capital and operating costs for a range of capacities were shown. (Kriss-Cornell)

APPLICATION OF MICROSTRAINER TO WATER TREATMENT AT NAGPUR (INDIA),
Central Public Health Engineering Research Inst., Ahmedabad (India).
M. Parabrahman, J. S. S. Lakshiminarayana, and M. V. Bopardikar.
Water Research, Vol 1, No 3, p 225-231, March 1968. 1 fig, 6 tab, 7 ref.

Descriptors: *Water treatment, *Phytoplankton, Turbidity, Diatoms, Efficiency, Chlorine.
Identifiers: *Microstrainer, *Suspended solids, *Algal counts, *Quality, Filtrability index.

The efficacy is dealt with of microstraining in the treatment of lake waters for drinking purposes. One Glenfield Standard unit, having a drum 2 1/2 ft. diameter and 2 ft wide enclosed by a mild steel tank was installed on the bank of Ambazari lake (India). The flow of wash water as well as microstrained water was measured with 'V' Notchweirs. Analyses and the methods employed were similar to APHA Standard methods, 1955. Filtrameter was used to determine the filtrability index (FI) and Laemocytometer was used for algal counts. There were no differences in pH, chlorides, and alkalinity between raw and microstrained waters tested. On an average, the turbidity of the water varied from 10.4 to 500 ppm and that of microstrained water from 7 to 2 ppm. The percentage reductions in suspended solids due to microstraining ranged from a minimum of 8.3 to 8.7. The average monthly reduction in FI ranged from 62.7 to 81.5. The percentage reduction in algal growth due to microstraining varied from 75 to 94. On the whole, microstraining works well for algae removal. Reduction in the chlorine demand of the raw water was noted if it was microstrained. (Shankar-Texas)

SEPARATION OF PHENOLS IN WATERS BY THIN LAYER CHROMATOGRAPHY,
National Research Centre, Cairo (Egypt). Water Pollution Dept.
Osman M. Aly.
Water Research, Vol 2, p 587-595, 1968. 3 fig, 3 tab, 36 ref.

Descriptors: *Phenol, *Chromatography, *Silica, Chlorination, Analytical techniques, *Potable water, Odor, Taste.
Identifiers: *Thin layer, *Technique, *Solvent system, Gel plates, RF values.

The separation of phenol in natural and waste water by thin layer chromatography to erradicate the objectionable taste and odors they impart to water especially after chlorination is described. Phenols are separated on thin layers of silica as their 4-aminoantipyrine or p-nitrophenylazo dyes. The antipyrl dyes are prepared by the condensation of phenols with aminoantipyrine in the presence of alkaline oxidizing agents. The azo dyes are prepared by coupling of phenols and p-nitrobenzene diazonium fluoborate. The antipyrine dyes were chromatographed on neutral silica gel plates and p-nitrophenylazo dyes on basic silica gel plates. Plates were developed by the ascending

technique at room temperature. (20-25 deg C). After chromatography, the plates were dried and the spots were colored. Solvent systems used in the technique are listed. The RF values of 4 aminoantipyrine derivatives of various phenol and p-nitrophenylazo dyes derived from different phenols are presented. It is concluded that a wide variety of phenols could be separated and identified by combination of two methods. The above technique was used for the identification of chlorination products of phenols in waters. (Shankar-Texas)

PROSPECTS FOR TREATING WATER FROM NUCLEAR ELECTRIC POWER STATIONS WITH PULVERIZED IONITES,
O. I. Martynova, N. P. Subbotina, and A. S. Kopylov.
Available from the Clearinghouse as JPRS-49539, $3.00 in paper copy, $0.65 in microfiche. Translated from Atomnaya Energiya. Translation JPRS-49539 2 Jan 70, 9 p, 9 ref.

Descriptors: Nuclear power plants, *Radioactive wastes, Filters, Ion exchange, Resins.
Identifiers: Ionites, USSR.

The purification of reactor water at atomic power stations whose principal purpose is the removal of corrosion products forming in the first loop and reducing the radioactivity of water, must ensure the removal of impurities present in coarsely dispersed, colloidal and ionized states, and therefore provision is made for both the clarification and ionization of water. Thus a discussion of the use of ionite filters is presented.

ADVANCES IN WATER POLLUTION RESEARCH.

Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, 1969. 936 p.

Descriptors: *Water resources, *Water pollution control, *Research equipment, *Analytical techniques, Water quality, Dissolved oxygen, Biochemical oxygen demand, Suspended load, Wastes, Sewage, Algae, Microorganisms, Phosphates, Hydrogenation, Aeration, Flocculation, Filtration, Model studies, Computers, Nutrients, Eutrophication.
Identifiers: *Water pollution research.

This volume contains the 53 original papers presented at the Fourth International Conference on Water Pollution Research held in Prague in April, 1969. Among the topics discussed are the self-purification of polluted rivers that have been artificially canalized, the factors that influence pollution under these conditions, and methods for predicting the extent of pollution and the distribution of dissolved oxygen in rivers. Computers may be used to analyze various alternative means of obtaining river water of required quality. The most important contribution towards pollution control is made by purifying sewage and other waste water. Purified sewage is an important source of the mineral nutrient requirements of microrganisms especially algae, and pollution control must include nutrient removal from effluents. (Woodard-USGS)

THE COURSE OF SELF-PURIFICATION PROCESS OF CANALIZED HIGHLY POLLUTED RIVERS,
Water Protection Research Section, Breslau (Poland).
Henry Manczak.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 1-13, 1969. 13 p, 10 fig, 14 ref, append.

Descriptors: *Self-purification, *Canals, *Water pollution, *Rivers, Impounded waters, Ice, Low flow, Biochemical oxygen demand, Dissolved oxygen, Equations, Path of pollutants, Streamflow.
Identifiers: Odra River (Poland).

The Odra River in Poland has a canalized water course during the navigable season, and is a free-flowing natural river in the post-navigable period. These circumstances made it possible to study the differences in self-purification of an impounded and free-flowing water course at the time of ice covering, when the river is free of ice, and also during low flow in the summer with a higher water temperature. Within a distance of 264 km along the river, 120 control stations were located, where 1440 samples were taken. The time of passage had been previously determined by means of a radioactive tracer (Br-82). (Woodard-USGS)

BOUNDARY LAYER EFFECT ON THE COURSE OF THE SELF-PURIFICATION OF SMALL STREAMS,
Hydraulic Research Inst., Brno (Czechoslovakia).
Vladimir Novotny.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 39-50, 1969. 12 p, 3 fig, 3 tab, 18 ref.

Descriptors: *Water pollution, *Boundary layers, *Effects, *Self-purification, *Streams, Mass transfer, Oxygen, Diffusion, Streambeds, Banks, Foreign research.
Identifiers: Deoxygenation coefficient, Czechoslovakia.

The relationship between the deoxygenation coefficient of rivers and the hydraulic conditions of flow was studied. Every mass transfer between benthic organisms and flowing water must take place through the diffusive boundary later. The velocity of the slowest process during the mass transfer is then the limiting factor for the intensity of the biochemical activity of these organisms; this also determines whether the processes in the benthal layer are aerobic or anaerobic. In the same way changes of the chemical composition of water may be explained. The classification of rivers into categories according to the degree of self-purification makes it possible to compare values for the deoxygenation coefficient in observation and theory in order to test whether the relationships obtained are in good agreement with reality. (Woodard-USGS)

WATER QUALITY PROTECTION PLANS IN RIVER BASINS,
Institute of Hydrotechnical Research, Bucharest (Rumania). Surface Water Lab.
Radu Antoniu.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969; London, Pergamon Press, Ltd, p 23-29, 1969. 7 p, 3 fig, 7 ref.

Descriptors: *Water quality control, *Watershed management, *River basins, *Standards, *Legislation, Water pollution, Biochemical oxygen demand, Dissolved oxygen, Foreign research, Water management (Applied), Water law.
Identifiers: *Romania.

In Romania, a law was enacted on 'Quality Conditions of Surface Waters' to initiate the elaboration of plans for protection of water quality in the river basins of the country. The scientific basis for control measures in the water quality protection is provided by research conducted since 1960 in the Surface Water Laboratory at the Institute of Hydrotechnical Research, Bucharest. These investigations include physical, chemical, biological and bacteriological studies in the main river basins of the country, and the development of new standards and guidelines. Categories in determining the water quality requirements of a stream are potable water supplies; water used for urban or recreation purposes; and irrigation and industrial water supplies. The basic indicators used in water quality protection plans for the rivers Olt, Arges, and Siret were 5-day biochemical oxygen demand, dissolved oxygen, and toxic substances. A drawing showing major water uses and sources of pollution in the Olt River Basin and a graph showing values of BOD and DO proposed for the year 1980 are included. (Woodard-USGS)

STREAM REAERATION USING MOLECULAR OXYGEN,
Crown Zellerbach Corp., Camas, Wash. Dept. of Manufacturing Services.
Herman R. Amberg.
In: Advances in Water Pollution Research, Proceedings 4th International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, p 291-298, 1969. 8 p, 2 fig, 3 tab, 5 ref.

Descriptors: *Reaeration, *Dissolved oxygen, *Oxygenation, *Streams, Diffusion, Application methods, Feasibility, Costs, Oregon, Louisiana, Water pollution treatment, Water pollution control, Water quality control.
Identifiers: *Molecular oxygen.

Experiments were designed to determine the feasibility of adding substantial quantities of dissolved oxygen to streams by means of two different aeration methods. In the Willamette River in Oregon, molecular oxygen was vented into the water passing through a power turbine. In the Pearl River in Louisiana oxygen was diffused through a multiport header on the bottom of the stream. Addition of oxygen to a power turbine resulted in oxygen absorption efficiencies of 39% when the water coming to the turbine was 81% saturated. Addition of oxygen to the turbine was relatively simple and inexpensive, whereas the use of a diffuser header resulted in a much lower oxygen absorption efficiency and was much more complicated and expensive. It is doubtful whether oxygen absorption efficiencies in excess of 20% can be attained with a well designed diffuser header placed along the stream bottom. Oxygen requirements and costs for various oxygen addition rates for power turbine and aeration header applications are tabulated. (Woodard-USGS)

COLE V PENNSYLVANIA PUB UTIL COMM'N (ADMINISTRATIVE CONTROL OF WATER SUPPLY AND QUALITY).

146 Pa Super 257, 23 A2d 121-124 (1941).

Descriptors: *Pennsylvania, *Regulation, *Water supply, *Administrative agencies, Utilities, Water works, Pipes, Reservoirs, Filtration, Pumping, Costs, Judicial decisions, Legal aspects, Water management (Applied), Water purification, Filters, Public health, Permits, Water quality control, Administrative decisions, Water treatment.

Plaintiffs were receiving raw, unfiltered water from a water supply company at little or no cost. The water company's permit from defendant Public Utility Commission to supply water was given upon condition that all water supplied be filtered. Plaintiffs were connected into the company's mains at a point above its filtration plant. Upon discovery of non-compliance with the permit and refusal of the water company to build a line back from its filtration plant which would enable plaintiffs to receive filtered water, defendant ordered plaintiffs' water supply discontinued. Plaintiffs asked defendant to require the water company to continue service to them. The Commission held that it was unlawful for the company to serve unfiltered water to the public and that it was unreasonable, in light of the expense involved, to require the company to serve filtered water to plaintiffs. Plaintiffs appealed to the superior court, which held that the question to be decided was an administrative one which was within the sound judgment and discretion of defendant, and its decision, which was based upon substantial evidence, was not to be disturbed. (Barnett-Florida)

ANNEBERG V KURTZ (RIGHT TO MAINTAIN A PRIVATE NUISANCE OBTAINED BY PRESCRIPTION).
28 SE2d 769-773 (Ga 1944).

Descriptors: *Georgia, *Prescriptive rights, *Canneries, *Pollution abatement, Easements, Downstream, Non-navigable waters, Decomposing organic matter, Legal aspects, Relative rights, Riparian rights, Riparian waters, Watercourses (Legal), Legislation, Disposal, Pollutants, Water pollution effects, Water pollution sources, Mills, Damages, Remedies.
Identifiers: *Nuisance (Private).

Plaintiff lower riparian landowner sought to enjoin defendant upper riparian cannery from polluting the non-navigable stream flowing across both lands. Plaintiff also sought damages alleged to have occurred from the resultant interference with operation of her grist mill. Defendant, who had discarded tomato peels and other debris into the stream for thirty-three years, contended he had thereby acquired a prescriptive right to so sue the stream and the land through which it flowed. The appellate court held that the right to maintain a private nuisance can be acquired by prescription and that the defendant had acquired such a prescriptive right. The decree appealed from was affirmed. (Price-Florida)

THERMAL POLLUTION, THE SHARP HORNS OF A NATIONAL DILEMMA,
Consolidated Edison Co. of New York, Inc., New York.
Charles F. Luce.
Water Spectrum, Vol 2, No 2, p 19-23, Summer 1970. 3 fig.

Descriptors: *Thermal pollution, *Electric power industry, *Electric power demand, *Cooling water, *Impaired water quality, Environment, Ecology, Powerplants, Water cooling.
Identifiers: *Closed cycle dry cooling.

Dealing with increasing thermal pollution problems, the author had nine propositions as follows: (1) We must protect the quality of waters. (2) The Nation's demand for electric energy will continue to increase at a rapid rate and this demand must be met. (3) To some extent, to build a power supply will impinge upon the environment. (4) The question of how much alternation of the ecology we are willing to accept as the price of a new power supply is the key question. (5) The resolution of tese questions should be the same whether the electric utility is investor-owned or publicly owned. (6) Nuclear generating stations do not present a new thermal discharge problem. (7) In meeting the power demand, the cooling capacity of many waters will be exceeded in the near future. (8) Eventually it will be necessary to develop closed cycle dry cooling devices. (9) Research is needed in developing less expensive and less bulky cooling facilities. It is emphasized that it is important to determine the actual ecological changes caused by thermal discharge. (Osborne-Vanderbilt)

USES OF WASTE HEAT,
Oak Ridge National Lab., Tenn.
Sam E. Beall.
Oak Ridge National Laboratory Review, Vol 3, No 4, p 9-14, Spring 1970.

Descriptors: *Thermal pollution, *Greenhouses, Water temperature, Powerplants, Distillation, Algae, Aquiculture, Fish, Shellfish, Crustaceans, Oysters, Seasonal.
Identifiers: *Waste heat, Thermal efficiency, Heat consumption.

Waste heat from powerplants which would normally add to the problem of thermal pollution can be reused for a profit. One use of this waste heat would be as a substitute for electricity in low-temperature industrial uses. Waste heat can be used for air cooling in ammonia or lithium bromide air conditioning systems during the summer when thermal releases need to be reduced the most. Another use of waste heat would be in the evaporation of waste water to allow reuse of the valuable water. Similarly, distillation of salt water or brackish water could make use of waste heat. The best possible use would be in the heating and cooling of greenhouses and poultry houses located on the reactor exclusion area. However, aquiculture pond heating promises large profits in the high yields of fish, shellfish, and crustaceans. Further study on the subject of waste heat reuse is being done in the Pacific Northwest where irrigation uses are being considered. (Osborne-Vanderbilt)

COMPUTER MODEL OF CONNECTICUT RIVER POLLUTION,
United Aircraft Corp., East Hartford, Conn. Research Labs.
Thomas E. Hoover, and Robert A. Arnoldi.
Journal of Water Pollution Control Federation, Vol 42, No 2, Part 2, p R67-R75, Feb 1970. 4 fig, 1 tab, 11 ref.

Descriptors: *Computer models, *Pollutant identification, *Biochemical oxygen demand, *Dissolved oxygen, *Temperature, Connecticut, Physical properties, Equations, *Digital Computers, Delaware River, *Mathematical models, *Simulation analysis.

The object of the study was to adapt the Deleware River program to produce a computer model of the Connecticut River within the state of Connecticut. This model would make use of the best information available describing physical conditions, such as flow volumes and sounding depths, as well as the latest pollution data describing DO, BOD, and temperature. Such a model made it possible to predict the effect of waste water input, artificial aeration, and temperature on the overall water purity. Equations describing aeration, photosynthesis, and bacterial decay were used in the model to calculate changes in DO and BOD concentrations in time. For model construction, the river was partitioned along its length into thirty-nine sections, each of which was assumed to be completely mixed with a uniform concentration of DO and BOD. This made it possible to use a simple one-dimensional mathematical model suited ideally to digital computation. The predicted DO and BOD concentrations in the Connecticut were presented. (Kriss-Cornell)

EVALUATION OF ALTERNATIVE SOLUTIONS FOR ACHIEVEMENT OF RIVER STANDARDS,
Quirk, Lawler and Matusky, New York.
Thomas P. Quirk, and Leonard J. Eder.
Journal of Water Pollution Control Federation, Vol 42, No 2, Part 1, p 272-290, Feb 1970. 16 fig, 3 tab.

Descriptors: *Mathematical models, *Computers, *Simulation analysis, *Water quality control, *River systems, Biochemical Oxygen demand, Dissolved oxygen.

The objectives of the study were: (1) the determination of the river's physical characteristics; (2) development of a mathematical simulation model of the river to predict BOD and DO profiles under any condition of flow, temperature, or waste discharge; (3) application of the simulation model to investigate in detail: (a) BOD assimilation capacity under critical weather and flow conditions and (b) the effects of sludge deposits, hydro-turbine venting and flow augmentation; (4) development of the comparative economics of alternative solutions for achievement of proposed water quality standards. The river studied was approximately 170 miles (274 km) in length with a drainage area of 3,500 sq miles (9,065 km). The major river characteristics involved were summarized. The composite effect yielded a discontinious river system physically, hydraulically, and biologically, requiring lengthy calculations for manual determination of assimilation capacity. Development of a mathematical simulation model and computer solution was indicated. A system analysis approach was utilized and the general procedure was described. Component models for oxygen input and oxygen consumption was shown and were grouped in terms of the basis used for flow regimen description. A composite model for river simulation was constructed by summing the components shown and the simulation as seen by the computer was illustrated. (Kriss-Cornell)

ECONOMICS OF THERMAL DISCHARGES,
Colorado State Univ., Fort Collins.
George Lof, and John Ward.
Industrial Water Engineering, Vol 7, No 1, p 12-18, Jan 1970. 5 fig, 10 ref.

Descriptors: *Economics, *Downstream, *Cooling water, Water quality, Chemicals, *Capital costs, *Operating costs, *Temperature.
Identifiers: *Thermal discharges.

Economic implications of thermal discharges were examined. The discharges from power plants and the potential effect that the discharges have on downstream water-users, that is, on downstream water used for cooling purposes, were described. It was pointed out in the literature that the temperature of water used for cooling purposes was often of more significance that the composition and chemical quality of water. The main objective was to indicate the approximate range of costs involved in

completely preventing thermal discharge; i.e., by circulating water through cooling towers, and to show the approximate costs to a downstream power plant being forced to use cooling water containing thermal discharges from an upstream electric station. The cost of cooling water recirculation included capital costs, primarily of the cooling tower installation, and operating costs, which were the make-up water, chemicals, and power for operating fans and pumps. The capital costs were dependent upon water flow required, prevailing wet bulb temperature of the air, the water temperature change through the tower, and the temperature of water delivery from the cooling tower to the condenser. The capital cost of the cooling tower installation was estimated from charts and tables and an example was given. Economic consequences of thermal discharge, such as water loss by evaporation, were discussed. (Kriss-Cornell)

WATER QUALITY CONTROL IN CALIFORNIA,
California State Water Resources Control Board, Sacramento.
Norman B. Hume.
ASCE Proceedings, Journal of the Sanitary Engineering Division, Vol 96, No SA4, Paper 7448, p 873-884, August 1970.

Descriptors: *Water quality control, *Legislation, *California, Water pollution control, Aesthetics, Water law, Water management (Applied), Water pollution, Water quality, Waste disposal.
Identifiers: Water quality legislation.

The Porter-Cologne Water Quality Control Act, effective January 1, 1970, completely revises California's 20 yr-old water pollution control law. Esthetics and protection of fish and wildlife have been added to beneficial uses of water to be protected. Area-wide planning for the solution to water pollution problems is encouraged. The interrelationships of water quality and water quantity as expressed by water rights are recognized. The State Water Resources Control Board now administers the related functions of water rights determination and water quality control. The State Board establishes policy and guidelines for nine Regional Water Quality Control Boards. The regional boards adopt water quality control plans and establish waste discharge requirements to meet the water quality objectives enunciated in the water quality control plans which must be approved by the State Board. Violators of waste discharge requirements may now be assessed civil penalties of up to $6,000 per day for each day of violation. (Knapp-USGS)

Identifiers: St. Lawrence Basin, North America.

Economic and other losses due to pollution in North America are examined including the socio-economic costs of improvements using existing technology. Canadian experiences in the Province of Ontario portion of the Great Lakes-St. Lawrenc Basin are reviewed as an example of the alternatives being considered in water management to bring the forces of improved technology to bear on augmenting the water supply through pollution control. The power and potential of basin-wide water management is considered as a device to achieve the often conflicting objectives of economic growth and maintenance of quality of the environment. 06. WATER RESOURCES PLANNING

6A. Techniques of Planning

TIME-CAPACITY EXPANSION OF URBAN WATER SYSTEMS,
Stanford Research Inst., Menlo Park, Calif.
Russell F. Scarato.
Water Resources Research Vol 5, p 929-936, October 1969, 8 p, 4 fig, 8 ref.

Descriptors: *Costs, *Capital investment, *Economics, *Water resource development, Water supply, Interest rate, Water demand, Planning, Financing, Budgeting, Water treatment, Capital costs, Rate of growth, Model studies, Technology, Optimization, Cost minimization, Pipelines.
Identifiers: *Economies of scale, *Water investment, *Pipeline size, Discount rate, Excess capacity.

The criteria for providing insight into the timing and capacity expansion decisions of a water facility are developed in this paper. A time-capacity expansion model is applied to two independent decisions: pipelines and water treatment. The model is a general minimum cost types, applied to time and size component expansion needed to meet an exogenously determined water system growth rate. It analyzes the economic impact of both the economies of scale in construction and the real cost of capital. The economic effects of timing and sizing decisions on total costs are plotted for various interest rates and levels of economies of scale. The model used is the one developed by Manne. As adapted by the author, the model shows that capital savings are available in urban water investments by establishing the initial design size and timing specifications of a proposal after quantitatively analyzing the effects of economies of scale and cost of capital under conditions of growth. (Murphy-Rutgers)

AN APPLICATION OF SPATIAL EQUILIBRIUM ANALYSIS TO WATER RESOURCE ALLOCATION,
Guelph Univ. (Ontario); and University of New England, Armidale (Australia).
J. C. Flinn, and J. W. B. Guise.
Water Resources Research Vol 6, No 2, p 398-409, April 1970.

Descriptors: *Water supply, *Prices, *River basin, *Optimization, Model studies, Economic analysis, Distribution, Social aspects, Maximization, Demand, Planning, Marginal cost, Agricultural water, Industrial water, Water pricing, Decision-making.
Identifiers: *Spatial equilibriom, *Social welfare.

The purpose of this paper is to demonstrate that the interregional equilibrium models developed by Takayama and Judge may be adapted to determine the efficient allocation and pricing of water in a river basin. It is assumed that the authority responsible for the allocation and pricing seeks a policy that will ensure that social welfare in relation to the available water supply is maximized. The capacity of the authority to supply water within any time period is assumed to be constrained by the physical structure of the system. The potential usefulness of such a model is demonstrated and the results discussed. The authors show that models of this type have considerable potential for empirical research in the field of water resources. (Murphy-Rutgers)

ECONOMETRICS OF JOINT PRODUCTION: A COMMENT,
Columbia Univ., New York.
V. K. Chetty.
Econometrica, Vol 37, No 4, p 731, October 1969. 1 ref.

Descriptors: Statistical methods, Least squares method, Regression analysis.
Identifiers: *Econometrics, Canonical correlation, Joint production.

In a recent paper, H D Vinod has suggested the use of canonical correlation techniques for the estimation of joint production functions. He has also argued that the least squares estimates of the joint production functions are inconsistent. In this note, it is demonstrated that the canonical correlation and the least squares methods yield the same estimates of the joint production functions, and that his proof of the inconsistency of the least squares estimates is erroneous. This article would be of interest to the water researcher attempting to develop a joint production model for water supply. (Loeb-Rutgers)
W70-08706

A NOTE ON ECONOMETRICS OF JOINT PRODUCTION,
Chicago Univ., Ill.
Potluri Rao.
Econometrica, Vol 37, No 4, p 737-738, October 1969. 3 ref.

Descriptors: Economics, Technology.
Identifiers: *Econometrics, *Joint production, Canonical correlation, Restrictions, Multiple products, Aggregation, Transformation curve.

In a recent paper, H C Vinod suggested a canonical correlations technique for estimating joint production processes. Estimates from such a procedure have economic interpretation only under certain restrictive assumptions. The purpose of this note is to point out these restrictions. Joint production includes two cases: (1) when there are multiple products, each produced under separate production process; and (2) when there is joint production, i.e., when several outputs are produced from a single production process. This may prove useful in the water area when applying econometric methods to estimate relations that reflect the joint production aspect of water supply. (Loeb-Rutgers)
W70-08707

ANALYSIS OF INVESTMENT RETURNS BY COMPUTER,
Michigan Univ., Ann Arbor.
James C. T. Mayo, and David Knoll.
The Engineering Economist, Vol 12, No 4, p 229-239, Summer 1967. 2 fig, 8 ref, 1 append.

Descriptors: *Computers, Costs, Investment, Computer programs.

Identifiers: *Investment returns, *Internal rate of return, Rate of return, Multiple rates, Pure investment, Mixed investment.

In the theory of financial management, the internal rate of return is frequently regarded as the true rate of return. This is because the rate is supposed to be independent of the firm's cost of capital, and, therefore, internal to the investment. However, as Teichroew, Robicheck, and Montalbano point out, this assumption of independence does not hold for all investments. If the cash expenditures of an investment are not restricted to the initial period, the investment return may vary directly with the firm's cost of capital. Moreover, these subsequent outlays may cause the project to have multiple internal rate of returns. Teichroew, Robicheck, and Montalbano have provided the theoretical concepts for understanding investments with multiple internal rate of returns and for calculating the functional relationship between project return and cost of captial for such investments. This paper presents a computer program of implementing Teichroew's, Robicheck's, and Montalbano's theoretical analysis and to illustrate the usefulness of the program with meaningful examples. This article has relevance to water investment and rate of return problems. (Loeb-Rutgers)

MODELING AND PREDICTING HUMAN RESPONSE TO THE VISUAL RECREATION ENVIRONMENT,
Northwestern Univ., Evanston, Ill., and Corps of Engineers, Washington, D.C.
George L. Peterson, and Edward S. Neumann.
Journal of Leisure Research, Vol 1, No 3, p 219-237, Summer 1969. 5 fig, 4 tab, 5 ref.

Descriptors: *Forecasting, *Preferences, Swimming, Model studies, Statistical methods, Lake Michigan, Photography, Beaches, Recreation, Recreation facilities, Psychological aspects, Estimating.
Identifiers: *Modeling, *Human response, Natural beaches, Crowding, City swimming beaches, Subjective responses, Recreation environment, Factor analysis.

The purpose of this paper is to develop and apply a conceptual and methodological approach for analyzing subjective response to the appearance of the recreation environment. The conceptual framework employs a mathematical preference model to hypothesize and quantify a man-environment relationship. To obtain data for the model, recreation environments were sumulated by photos and responses classified by techniques of psychological measurement. The preference functions should be sensitive to differences in characteristics of alternative environments as well as to differences in people's responses to the same environmental conditions. It is hypothesized that such responses are influenced by measurable factors such as life style, social rank, culture rank, culture, and personality. The model is demonstrated using Lake Michigan beaches. Results show that two groups with different preferences are identifiable. The larger group prefers scenic natural beaches and the smaller prefers city swimming beaches. The study shows conflicting user preferences for the characteristics of beaches. Studies of this nature would be helpful to the water planner in determining the types of recreation facilities that should be provided. (Loeb-Rutgers)
W70-08709

THE ANALYSIS AND EVALUATION OF PUBLIC EXPENDITURES: THE PPB SYSTEM, A COMPENDIUM OF PAPERS SUBMITTED TO THE SUBCOMMITTEE ON ECONOMY IN GOVERNMENT OF THE JOINT ECONOMIC COMMITTEE.
Joint Committee on Economics (U.S. Congress). Subcommittee on Economy in Government.
Available from the Superintendent of Documents, Wash. D.C.: Vol 1, $2.75, Vol 2, $0.75, Vol 3, $1.75. Economic Joint Committee, Joint Committee Print, US Government Printing Office, Washington, DC, 1969. 124 p, 3 vols.

Descriptors: *Planning, *Budgets, *Economic evaluation, *Forecasting, Government, Resource allocation, Prices, Costs, Benefits, Economic efficiency, Decision-making, Water pollution optimization, Risk, Uncertainty, Data collection, Regional analysis.
Identifiers: *Programing, Budgeting, Institutional factors, Multiple objectives, Agency experience, Social overhead.

This is a three volume report on the use of the Planning, Programming and Budgeting (PPB) System in the analysis and evaluation of government expenditures. The study is divided into six parts. Part I considers the issues of economics and equity pertinent to governmental market decisions. The papers in Part II attempt to isolate the factors effecting governmental efficiency in expenditures. In Part III a few of the key problems in applying economic analysis in the public sector are discussed. Part IV is a comprehensive discussion of the PPB System in the Federal Bovernment. The papers in Part V appraise and evaluate the structure and performance of PPB to date. Those in Part VI direct attention to the major issues for policy analysis in each of the primary functional areas of the Federal budget. The large role played by government in the water resources area makes the PPB System described of use in the analysis and evaluation of government water resources investments. (Murphy-Rutgers)
W70-08721

SYSTEMS FOR ANALYSIS: PPB AND ITS ALTERNATIVES,
Brookings Institution, Washington, D.C.
Allen Schick.
In The Analysis and Evaluation of Public Expenditures: The PPB System, a compendium of papers submitted to the Subcommittee on Economy in Government of the Joint Economic Committee, US Government Printing Office, Washington, DC, 1969, Vol III, p 817-834.

Descriptors: *Systems analysis, *Economic evaluation, *Government, *Budgeting, *Planning, Programing, Management, Economic efficiency, Social aspects, Costs, Benefits, Decision-making, Time.
Identifiers: *PPB System, Program effectiveness, Public benefits, Crosswalk system, Two-track system, Policy planning.

The author examines the strength and weakness of the conception of the Planning-Programing-Budgeting (PPB) system relative to alternative approaches to public expenditures analysis. This topic represents an important method of evaluating public water resources investments. The paper considers several difficulties relating to the purpose and scope of policy analysis: (1) The budget process is evaluated as being nonanalytic or antianalytic, (2) Is a systems approach the most effective way to enhance the analytic caliber of public choices. The author feels it may be efficacious to promote analysis without regard for its systems character, (3) Assuming a system approach is justified, the author tries to determine what the mission and scope should be, (4) Finally the author then investigates whether the scope and focus of the analysis should be public benefits or program effectiveness. (Murphy-Rutgers)
W70-08722

TODAY'S PPBS: THE FATAL TRIUMPH OF FINANCIAL MANAGEMENT OVER ECONOMICS,
Veterans Administration, Washington, D.C.
Samuel M. Greenhouse.
In the Analysis and Evaluation of Public Expenditures: The PPB System, a Compendium of papers submitted to the Subcommittee on Economy in Government of the Joint Economic Committee, US Government Printing Office, Washington DC, 1969, Vol III p 886-898.

Descriptors: *Systems analysis, *Economic evaluation, *Planning, *Programming, *Budgeting, *Government, Forecasting Economic analysis, Decision-making, Management, Costs, Benefits, Value, Prices, Economic efficiency.
Identifiers: *PPBS, Marginal utility, Market system, Executive branch, Opportunity cost.

The emergence of the government as an economic enterprise calls for the development of procedures for the economic evaluation of government enterprise activities. In the area of water resources the government is often the largest investor so that a proper method of evaluation should be of interest to the water researcher. The author shows that an economic form of planning-programming-budgeting system (PPBS) is the procedure needed to replace the financial management type of PPBS presently in use. The marginal utility theory of value, because it provides the government with a conceptual basis upon which to appraise the benefit of an enterprise's individual offerings, is essential to an economic PPBS. Applying this theory calls for identifying the Federal enterprise's final outputs and the customers who receive them. In the last section the paper recommends a specific design including a standardized government-wide program structure and substructure for the economic PPBS. (Murphy-Rutgers)

PUBLIC EXPENDITURE ANALYSIS AND THE INSTITUTIONS OF THE EXECUTIVE BRANCH,
Laird Systems, Los Angeles, Calif.
Fred S. Hoffman.
In The Analysis and Evaluation of Public Expenditures: the PPB System, a compendium of papers submitted to the Subcommittee on Economy In Government of the Joint Economic Committee, Vol, 3 p 925-942, U.S. Government Printing Office, 1969.

Descriptors: *Planning, *Budgeting, *Programing, *Government, *Decision-making, Benefit-cost analysis, Forecasting, Social aspects, Economic efficiency, Multiple-purpose projects, Resource allocation, Risk, Income, Data processing.
Identifiers: *PPB, Executive branch, *Five-year plan.

There are large impediments to sound and objective economic analysis of public water resource investments. This paper, analyzes; 1- the origins of systematic analysis in the Federal Government, 2- the appropriateness and value of this kind of analysis, and 3- the obstacles in the executive branch that are being faced in the introduction of the planning, programing, budgeting, (PPB) system. The author discusses the problems raised by multiobjective programs, the lack of sound theory and the political sensitivity of many programs. The paper concludes with a discussion of a number of suggestions designed to increase the effectiveness of benefit cost information in the decision process. The general discussion of budgeting problems makes this paper relevant to researchers interested in the problems of financing and budgeting water projects. (Murphy-Rutgers)
W70-08724

THE STATUS AND NEXT STEPS FOR PLANNING, PROGRAMING, AND BUDGETING,
Bureau of the Budget, Washington, D.C.
Jack W. Carlson.
In the Analysis and Evaluation of Public Expenditures: The PPB System, a compendium of papers submitted to the Subcommittee on Economy In Government of the Joint Economic Committee, Vol. II, U. S. Government Printing Office, 1969.

Descriptors: *Planning, *Budgeting, Decisionmaking, *Programing, *Government, Forecasting, Economic evaluation, Financing, Costs, Benefits, Economic efficiency, Data collection, Resource allocation, Social aspects.
Identifiers: *PPB, *Program structure, Education, Issue letters, Financial planning.

The purposes of the Planning--Programing-Budgeting system (PPBS) are to aid decision-makers in more effectively allocating limited public resources, to reduce the portion of the budget that is uncontrollable, to understand the actual impact of public programs, to assure the orderly presentation of relevant analysis for decision making, to identify programs that no longer serve national objectives, to integrate long-range objectives with current-year budgets and to connect planning and budgeting with actual performance. These are vital aims in the evaluation of public water resource projects, making this paper of interest to the water researcher. The author argues that PPB has been moderately successful and will contribute a great deal to public policy decisionmaking in the future. In a set of thirteen attachments to the paper, a number of displays pertinent to the structure and functioning of the PPB System are presented. (Murphy-Rutgers)
W70-08725

THE PLANNING, PROGRAMING, AND BUDGETING SYSTEM IN THE DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE: SOME LESSONS FROM EXPERIENCE,
Brookings Institution, Washington, D.C.
Alice M. Rivlin.
In: The Analysis and Evaluation of Public Expenditures: The PPB System, a compendium of papers submitted to The Subcommittee On Economy In Government of the Joint Economic Committee, Vol 3, p 909-922, U.S. Government Printing Office, 1969.

Descriptors: *Economic evaluation, *Planning, *Programing, *Budgeting, Decision-making, Systems analysis risk, Measurement, Statistics, Education, Project planning, Project purposes, Government.
Identifiers: *Health, Education, and Welfare, *PPB, Planning cycle, Five year plan.

Many of the problems involved in evaluating government programs in the area of health, education and welfare are similar to those encountered in water resources. Thus an insight into the evaluation of the former should be some help in studying budget problems for water projects. The author believes that systematic analysis and program evaluation are important components of an effective agency and efficient programs. The paper describes the evolution of systematic analysis in the Department of Health, Education, and Welfare, describing the program budget and information system, the quantitative evaluation of program accomplishment, the analysis of alternative policy actions and the development of a five year plan in the context of the planning cycle. This type of analysis is able to improve the decision-making process by largely reducing the element of uncertainty involved. The author concludes by stating the necessity of systematic analysis for effective planning and evaluation of government projects. (Murphy-Rutgers)
W70-08726

PRESCRIPTION FOR AN EFFECTIVE GOVERNMENT: ETHICS, ECONOMICS, AND PPBS,
Institute for Defense Analysis, Arlington, Va.
Paul Feldman.
In the Analysis and Evaluation of Public Expenditures: the PPB System, a compendium of papers submitted to the Subcommittee on Economy in Government of the Joint Economic Committee U S Government Printing Office, Washington, D.C., 1969, Vol III, p 865-885.

Descriptors: *System analysis, *Economic evaluation, *Budgeting, Decision-making, Planning, Forecasting, Economic justification, Government, Taxes, Cost, Benefits, Cost-benefit analysis, Financing, Competition.
Identifiers: *PPB, *Ethical criterion, *Market imperfections, Equilibrium.

This article indicates that since the inception of Planning-Program-Budgeting (PPB) there has been little modification in the substance of budget decision-making. PPB has been used to evaluate government water resource investments and this article should be relevant to the water researcher. The author discusses the reasons for the failure of PPB and points out the necessity of defining an ethical basis for government behavior without which PPB is useless. The paper then specifies an ethical code and draws conclusions regarding the desirable activities of government. A specific proposal is presented which applies these conclusions to the operation of the PPB system. The author finds that government should remove market imperfections and that when government undertakes expenditures it should attempt to distribute the tax burden in accord with the distribution of benefits. The new structure proposed for the PPB system indicates what standards should be used for measurement and in what direction the analysis should proceed. (Murphy-Rutgers)
W70-08727

ECONOMIC ANALYSIS IN NATURAL RESOURCE PROGRAMS,
George Washington Univ., Washington, D.C.
Jack C. Knetsch.
In: The Analysis and Evaluation of Public Expenditures: the PPB system, a compendium of papers submitted to the Subcommittee on Economy in Government of the Joint Economic Committee, U.S. Government Printing Office, Washington, D.C., Vol. III, p. 1087 to 1101.

Descriptors: *Economic analysis, *Cost-benefit analysis, *Natural resource development, *Government, Social aspects, Recreation, Pollution, Economic justification, Demand, Economic efficiency, Planning, Budgeting, Taxes, Forecasting.
Identifiers: *Market criteria, *Nonmarket values.

In this paper the author applies the concepts and techniques of benefit-cost analysis to additional public expenditure issues in natural resources programs. Although most public sector action in the natural resource field is a result of market failure, the author asserts that market criteria can be developed and applied to expenditure policy in this area. The author also appraises the demand studies done in the natural resource area and makes suggestions for improving procedures. He points out the problems related to those outputs of public projects which are difficult to quantify and measure and suggests some principles for improving the estimates of economic demands. The author then discusses the question of divergencies between social costs and benefits and those which fall on a single individual. He argues that the purely local or secondary benefits of public investment projects should not be counted in a national efficiency criterion. Although concerned with all natural resources, the authors comments are directly applicable to water resources. (Murphy-Rutgers)

A BRANCH-AND-BOUND ALGORITHM FOR MULTI-LEVEL FIXED-CHARGE PROBLEMS,
Research Analysis Corp., McLean, Va.
Arnold P. Jones, and Richard M. Soland.
Management Science: Theory, Vol 16, No 1, p 67-76, September 1969. 1 fig, 2 tab, 9 ref.

Descriptors: *Optimization, *Mathematical models, *Linear programming.
Identifiers: Branch-and-bound algorithm.

Multi-level fixed-charge problems were mathematical optimization problems in which the separable portion of the objective function was the sum of piecewise continuous functions of a single variable. A description of a branch-and-bound algorithm that found a global solution to the problem was given. Several representative applications were described as examples. The algorithm had the feature that a good feasible solution was generated at the start. Moreover, at each step of the algorithm an additional feasible solution was generated for comparison with the best solution found previously. A linear mathematical function was used to illustrate the multi-level fixed-charge problem. Then the branch-bound algorithm using subsets where the solution value is less than or equal to the lower bound for every subject was described in order to find an optimal solution to the problem. Extensions of the work described was discussed. Numerous water resources problems contain fixed charge components, and techniques such as those described in this paper should be helpful in solving them. (Kriss-Cornell)

COMPUTER AIDS IN CRAG WATER PLAN,
Clark and Groff Engineers, Salem, Oreg.
Lloyd K. Clark, Andrew M. Klein, and Carter H. Harrison.
Water and Wastes Engineering, April 1970, Vol 7, No 4, p 49-51. 2 fig, 2 tab.

Descriptors: *Computer programs, *Digital computer, Design, Planning, Water Resources, Mathematical models, *Costs, *Optimization, Water demand.
Identifiers: Portland (Ore), Vancouver (Ore).

A computerized economic analysis was used to formulate a long-range regional water plan for the Portland-Vancouver area of Oregon and Washington. Each of four rivers in the four county area could supply twice the total demand anticipated by the year 2000 but the problem was to determine which of many sources might best serve each area. All regional planning in the Portland-Vancouver area was co-ordinated by the Columbia Region Association of Governments (CRAG). A long-range plan showing how the areas municipal water needs could be met up to the year 2000 with water demands expected to average almost 300 mgd and to peak at over 700 mgd was commissioned by CRAG. The demands will be met by potential sources that were listed. Future water requirements were based on future population density. A total of 90 water-use areas and 30 sources were developed and a digital computer was employed. The objective was to serve each water-use area at the lowest average cost. The computer approach consisted of four programs to increase efficiency. One program stored population and water-demand projections, another stored data on the sources of supply. The last two programs compared alternate ways of serving the water-use atea. Five major cost items were focused on : (1) transmission line construction; (2) treatment plant construction; (3) treatment plant

operation and maintenance; (4) source of supply costs; and (5) pumps and power. Advantages and disadvantages to the computer approach were given. (Kriss-Cornell)

ECONOMIC EVALUATION OF A WATER RESOURCES DEVELOPMENT PROJECT IN A DEVELOPING NATION,
California Univ., Berkeley.
Fereidoun Mobasheri.
Water Resources Center Contribution No 126, Hydraulic Engineering Laboratory, Univ of Calif, Berkeley, July 1968. 191 p, 14 fig, 30 tab, 79 ref, 2 append.

Descriptors: *Optimization, *Linear programming, *Dynamic programming, *Cost-benefit analysis, *Social aspects, *Water resources development, *Economics, Synthesis, Multiple-purposes project, Irrigation water, Constraints.
Identifiers: Sensitivity analysis, Parameters.

An economic evaluation criterion was synthesized using the concept of benefit-cost analysis for estimating the social benefit and cost of a water resources development project in a developing country. The concept was modified so that multiple national goals and structural disequilibrium of the economy were considered. Shadow prices were used to measure economic value of production factors when there was a disequilibrium between demand and supply. The synthesized economic evaluation criterion was applied to a hypothetical multiple purpose water resources project. Using three design variables, a multi-level optimization technique was developed. The direct search technique combined with a parametric linear program and a dynamic program found the optimum combination of design variables to maximize the present net value of social benefit. The linear program found optimum allocation of annual supply of irrigation water among various crops to maximize the benefit from irrigation. The dynamic program determined optimum schedule of monthly releases from the reservoir to maximize return from power while mandatory releases, irrigation supply, and other physical constraints of the system were satisfied. A sensitivity analysis was carried out to determine optimum design changes as economic parameters were varied. (Kriss-Cornell)
W70-08854

ECONOMIC EVALUATION OF A WATER RESOURCES DEVELOPMENT PROGRAM IN A DEVELOPING NATION - CHAPTER V - MODIFICATION OF BENEFIT-COST ANALYSIS, SYNTHESIS OF A NEW CRITERION,
California Univ., Berkeley.
Fereidoun Mobasheri.
In: Water Resources Center Contribution No 126, Hydraulic Engineering Laboratory, Univ of Calif, Berkeley, p 36-77, July 1968. 1 fig, 53 ref.

Descriptors: *Cost-benefit analysis, *Water resources development, *Social aspects, Mathematical model, Equations, Synthesis.
Identifiers: Economic parameters, Shadow prices, Balance of payments.

Necessary modifications of the benefit-cost criterion for a water resources development project in a developing country were studied. The concepts of the social rate of discount and social opportunity cost of capital were introduced. An economic model was developed for measuring these two economic parameters. The problem of under-employment of unskilled agricultural labor was studied. Equations were developed for calculation of the shadow price for unskilled labor. The problem of balance of payments was introduced and equations were developed to show the effect of the development of a water resources project on the balance of payments. These modifications were then combined and an economic evaluation criterion was synthesized. (Kriss-Cornell)

ECONOMIC EVALUATION OF A WATER RESOURCES DEVELOPMENT PROJECT IN A DEVELOPING NATION - CHAPTER VI - OPTIMUM DESIGN OF A MULTIPLE PURPOSE WATER RESOURCES PROJECT,
California Univ., Berkeley.
Fereidoun Mobasheri.
In: Water Resources Center Contribution No 126, Hydraulic Engineering Laboratory, Univ of Calif, Berkeley p 78-123, July 1968. 9 fig, 22 tab, 18 ref.

Descriptors: *Optimization, *Linear programming, *Dynamic programming, *Mathematical models, Cost-benefit analysis, Design, Multiple purpose projects.
Identifiers: *Direct search technique, Economic parameters.

A hypothetical water resources project was developed when the criterion function synthesized for economic evaluation was used for calculation of social benefit cost of the project. A mathematical model was developed for optimum design of the project. Three economic parameters - the annual rate of gross national project growth, the degree of underemployment of unskilled labor and shadow foreign exchange rate, were parametrically varied to find how optimum design was affected by economic parameters. The optimization algorithm used to determine efficient allocation of available resources required to maximize net return was linear programming. Dynamic programming determined optimum operation of the project. Direct search for the optimum scale of development was obtained through the linear and dynamic program's subroutines. A sensitivity analysis performed determined changes in the optimum design as economic parameters were allowed to vary. Seven optimum designs were determined for seven combinations of the three economic parameters. (Kriss-Cornell)

WATERSHED MODELING BY ELECTRONIC ANALOG COMPUTER,
Utah Water Research Lab., Logan.
J. Paul Riley, and Duane G. Chadwick.
Typescript, 1968. 27 p, 10 fig, 11 ref.

Descriptors: *Analog computers, *Simulation analysis, *Hydrologic data, Watersheds (Basins), River basins, *Mathematical models, Optimization, *Water supply, Utah.
Identifiers: Sevier River, Circle Valley.

Assessment of the downstream consequences resulting from changes at specific locations in a hydrologic system to increase water supply was studied at Utah State University using electronic analog simulation. First a general introduction to simulation and a description of a hydrologic model were given. Specifically, the approach to hydrologic simulation at Utah State University was to subdivide the river basin into relatively large but meaningful components, describe their operation and fundamental processes as functions of data ordinarily available, verify, and improve definition by using more and smaller control volumes and increments. An actual hydrologic unit was then simulated. Results were obtained by the simulation of a subbasin of the Sevier River drainage in central Utah. It is referred to as Circle Valley and contains approximately 93,000 acres of mountain watershed and agricultural land. A hydrologic flow diagram where each block represents a basic hydrologic process expressed in mathematical terms was presented. A computer model synthesized these relationships and an analog flow chart for the model was shown. Mean monthly outflow values for 1962 were computed and observed. Analog simulation of other watershed areas was also attempted. (Kriss-Cornell)

FEDERAL EVALUATION OF RESOURCE ALLOCATION INVESTMENTS: A CASE STUDY,
Cornell Univ., Ithaca, N.Y.
Robert J. Kalter.
Water Resources and Marine Sciences Center and Department of Agricultural Economics, Cornell University, Ithaca, New York, February 1970. Tech Report No 24, AE Res 313. 89 p, 20 tab, 1 append.

Descriptors: *Resource allocation, *Investment, *Optimization, *Research and development, *Economic efficiency, Project planning, *Evaluation, West Virginia.
Identifiers: Empirical testing, Task force, Data problems, Stonewall Jackson Reservoir.

The report presented the results of a research effort whose principal objective was to empirically test the procedures recommended for evaluation of public resource investments by a Special Task Force of the Water Resources Council. The main recommendations of that task force included a broadening of the traditional framework of project analysis beyond economic efficiency to include additional criteria of regional development, environmental enhancement, and well-being of people. Since the methodology outlined for implementation by the task force was not often fully developed or was, at times, inconsistent with theoretical principles, four criteria for project evaluation were presented. In addition, alternatives in plan formulation and a system of accounts necessary to display evaluation results were developed. Each major section included subsections on conceptual foundation for evaluation of the particular objective, methodology necessary and appropriate for such evaluation, data needs and possible data sources for empirical implementation, consideration of actual data sources and a summary of specific data problems, empirical testing of the methods proposed with realistic hypothetical data and appropriate display of findings. Tests were conducted on the proposed project of the U.S. Army Corps of Engineers on the West Fork River, West Virginia known as the Stonewall Jackson Reservoir. The project involved a concrete dam and reservoir at Brownsville, WV which was multipurpose in nature. (Kriss-Cornell)

FACILITIES DESIGN - A PROBLEM OF SYSTEMS ANALYSIS,
Cornell Univ., Ithaca, N.Y.; and Birmingham Univ. (England).
Bryon W. Saunders.
Typescript for International Conference on Production Research, University of Birmingham, Birmingham, England, April 6-10, 1970. 12 p, 9 ref.

Descriptors: *Optimization, *Systems analysis, *Resources, *Waste treatment, *Pollution abatement, *Population, *Decision making, *Facilities, *Design, Water costs.

The problem of how to measure the internal activities of the manufacturing system which must be correlated with the externalities in the larger total ecosystem in order to achieve the necessary optimization was presented. Examples of waste and pollution were given to indicate the magnitude of the problem. The two most directly related factors causing the problem were suggested to be overpopulation and inadequate and inappropriate decision criteria in the form of product cost minimization. Overpopulation, within certain areas and regions, creates facilities design conditions and increasing rates of use of basic resources. It has many interesting facets that need research as 'systems' problems in such areas as clean air, water, oxygen, land, recreation, etc. It was postulated that the population problem therefore is the underlying cause of all others. Secondly, it was suggested that industry is a significant contributor to the problems because of its decision criteria. An example was given of the pollution of a Norwegion Valley. Inadequate systems designs have developed and therefore better criteria, more efficient measures of effectiveness, and development of studies that will replace empiricism and intuition with known measurements that will allow optimization of the total ecosystem leading to an improved 'quality of life' for all must be established. (Kriss-Cornell)

MATHEMATICAL MODELING IN HYDROLOGY,
International Association of Scientific Hydrology, Gentbrugge (Belgium).
D. R. Dawdy, and G. P. Kalinin.
Bulletin of the International Association of Scientific Hydrology, Vol XV, No 1, March 1970, p 145-154. 10 p, 24 ref.

Descriptors: *Mathematical models, *Hydrology, *Computers, *Data processing, Simulation analysis, *Parametric hydrology, *Stochasic processes, Systems analysis, *Water resources development, Design.

The report was prepared on behalf of the committee on Mathematical Models in Hydrology of IASH. The successful development of branches of hydrology such as hydrologic forecasting, hydrological calculations, theory of water resources control and mathematical processing of observation data by use of application of physical and mathematical methods and use of computers was discussed. Topics included were: (a) scientific data processing; (b) solution of the equations of mathematical physics; (c) semi-empirical hydrologic simulation; (d) theory and practice of water resources control; and (e) the shortcomings of present methods to the development of theoretical and applied hydrology and methods of runoff control. The three working groups of the committee, which stressed applications of particular mathematical tools rather than the discipline in which a particular problem occurred, were then presented. They were (1) Parametic Hydrology concerning deterministic models; (2) Stochastic hydrology concerned with probabalistic models such as chain simulation models or gueueing models; and (3) Water Resources Systems concerned with decision theory in planning and design and applications of operations research to the water resources field. A general picture of what has been done and what yet remains to be done in the area of mathematical models in hydrology was given. (Kriss-Cornell)

SURFACE IRRIGATION USING KINEMATIC-WAVE METHOD,
Utah Water Research Lab., Logan.
Cheng-lung Chen.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR1, Paper 7134, p 39-46, March 1970. 2 fig, 8 ref.

Descriptors: *Mathematical models, *Surface-groundwater relationships, *Irrigation design, Drainage, Infiltration, Overland flow, Soil water movement, Groundwater movement, Irrigation practices, Irrigation ditches.
Identifiers: *Kinematic wave models.

In the kinematic-wave method, one-dimensional unsteady mathematical models for flow in surface irrigation consist of the equation of continuity for the surface flow, the simplified equation of motion, a uniform-flow formula for the surface flow, the simplified flow equation for the subsurface flow, the infiltration equation or an empirical formula, and appropriately prescribed initial and boundary conditions. The kinematic-wave method alone is valid only for supercritical flow. The complete model may be solved to yield a general solution that depends on the solution form of the cumulative depth of the subsurface flow at the head ditch. A particular solution for a constant infiltration rate reduced from the general solution is shown to be compatible with that obtained from the modified Lewis-Milne equation. (Knapp-USGS)

ELKHART LAKE, WISCONSIN COMPREHENSIVE PLAN.
Wisconsin State Dept. of Local Affairs and Development, Madison. Bureau of Local and Regional Planning.

Available from the Clearinghouse as PB-189 006, $3.00 in paper copy, $0.65 in microfiche. Final report, ELVPC-70-3, Jan 1970, 188 p.

Descriptors: *Wisconsin, *City planning, Recreation, Water pollution, Land use, *Planning, Maps, Economics.
Identifiers: Elkhart Lake (Wisconsin).

Elkhart Lake is a small recreation and tourist-oriented cast central Wisconsin community. Although recreation activities have shown some growth during the summer months, very little other industry exists in the village and growth has been moderate for the past several decades. It is anticipated that this trend will continue. A vital concern of local officials and citizens is the protection and preservation of Elkhart Lake, the village's primary recreational and scenic resource. Although little progress has been made to date, village officials and local interest groups are attempting to halt pollution of the lake through provision of sanitary sewer facilities to lake-shore properties, and restrictions on use of the lake for recreational activities.

Identifiers: Orographic precipitation.

Life in the desert, as elsewhere, needs water for existence. By definition, deserts are dry, but life does survive, and man has used desert areas for his purposes for millenia. Man's capability to use the desert is changed as he gains new technology and new sources of energy that make new water supplies available to him, but his impact on the ecology of the desert also is different. The sources of water in the desert and how these sources are being used are reviewed. Large, complex irrigation systems existed 5000 yr ago, but new technological capabilities exists, including hydroelectricity, large dams, large and efficient earth moving equipment, and improved agricultural practices. Using modern technology, much can be done to permit further use of the attractive desert environment; great care and forethought are required, lest use becomes exploitation and the ecological consequences outweigh the benefits. (USBR)

THE BRANDYWINE PLAN,
Pennsylvania Univ., Philadelphia.
John C Keene, and Ann Louise Strong.
Journal of the American Institute of Planners, Vol 36, No 1, p 50-58, January 1970. 2 fig, 1 photo.

Descriptors: *Water resources, Eminent domain, Easements, Regulation, Data Collections, Communication, Political aspects, Legal aspects, Economics, Value.
Identifiers: *Brandywine Plan, Urban development, Local institutions, Personality patterns, Objectives, Inducements, Restrictions.

The Brandywine Plan was concerned with a program for protecting water resources and guiding urban development as it would occur over the next fifty years in a rural watershed thirty miles west of Philadelphia. The authors describe the development of the plan and the opposition and rejection of it via the political system, local institutions, the legal system, economic aspects, the personality and value patterns of the watershed residents. In conclusion, the authors recommend that for a proposal such as this to be accepted the following factors must exist: (1) There must be sufficient time available to work out a program that is endorsed by a substantial number of residents. (2) Proponents must be willing and able to proceed with experiments on a small scale so that some of the novelty of the program can be dispelled. (3) Objectives of the program must be modest so as to allow more flexibility in working out a successful compromise of conflicting interests. (4) Positive inducements must be available to balance restrictions perceived by residents. (Loeb-Rutgers)

ENGINEERING ECONOMY IN THE UNITED STATES IN RETROSPECT--AN ANALYSIS,
Stevens Inst. of Tech., Hoboken, N. J.
A. Lesser.
Engineering Economist Vol 14, No 2, p 109-115, Winter 1969, 7 p, 18 ref.

Descriptors: *Economic analysis, *Engineering, *Economics, *Resource development, *Cost-benefit analysis, Mathematical studies, Risk, Marginal utility, Computers, Input-output analysis, Budgeting, Investment, Financing, Bonds, Mathematical studies.
Identifiers: *Engineering economy, *Actuariel mathematics, Business cycle, Welfare economics, Capital rationing.

This article traces and analyzes the evolution of the main streams of thought of engineering economy in the United States. Engineering economy is defined as a guide for the economic selection among technically feasible alternatives for the purpose of a rational allocation of scarce resources. The three separate (but sometimes tangential) streams of thought on this topic are classical engineering economy, benefit-cost analysis and economic analysis. The study of these seems to indicate that resource development should be closely related to engineering economy in the United States. This conclusion is reached after considering both the three main streams of development and such considerations as risk, uncertainty, utility theory, and mathematical or computer models. Due to the importance of water resources in natural resource development, water researchers will find this article of interest. (Murphy-Rutgers)

CRITERIA FOR PUBLIC INVESTMENT: A COMMENT.
Johns Hopkins Univ., Baltimore, Md.

Journal of Political Economy Vol 78, No 1, p 175-177, Jan/Feb. 1970.

Descriptors: *Discount rate, *Economic evaluation, *Cost-benefit analysis government, Time, Income, Economic efficiency, Social aspects, Decision-making, Mathematical studies.
Identifiers: *Private investment, *Government investment, *Social cost, Opportunity costs, Rate of time preference.

The author is concerned with the recent interest shown in using the rate of return on private investments for discounting purposes when evaluating the time streams of benefits and costs generated by public investments. The proper discount rate to use when evaluating water resource investments has created controversy and this clarification of issues should prove valuable to the water resource planner. The paper shows that: (1) The social opportunity cost of transferring funds from the private to the public sector is independent of the source of such fund, i. e. private consumption or private investment. (2) The proper investment criterion for public investment is that the present discounted value, using the rate of return on private investment as the discount factor, of benefits minus costs be non-negative. (Murphy-Rutgers)

ANALOGUE COMPUTING FOR PROJECT EVALUATION,
Imperial Chemical Industries Ltd., Ill.
David W. Gillings.
The Engineering Economist Vol 11, No 2, p 1-11, Winter 1966 11 p, 1 tab, 4 fig.

Descriptors: *Economic evaluation, *Project planning, *Computers, Economics, Profits, Digital computers, Analog computers, Income, Competition, Prices, Interest rate, Costs, Demand, Investment.
Identifiers: *Project evaluation, *Rate of return, *Cash flow.

Methods of profitability estimation based on discounted cash flow principles are now well established and widely applied. If the full benefit of using comprehensive methods is to be derived, there must, however, be extensive calculation. These methods should explore all of the alternative technical proposals for meeting the specified aim of the project and all the alternative conditions of the market in which the project will have to be operated. This can easily be accomplished through the use of computers. The author describes the application of computers to these computations and gives an example of an industrial problem. Some of the advantages are pointed out and other possible lines of application described. The importance of project evaluation and economic forecasting in the water resource area make this article valuable (Murphy-Rutgers)

PLANNING IN RURAL AREAS,
Cornell Univ., Ithaca, N.Y.
Alan J. Hahn.
Journal of the American Institute of Planners, Vol 36, No 1, p 44-49, January 1970.

Descriptors: *Planning, *Rural areas, Governments, Costs, Demand, Cities, Zoning, Leadership, Natural resources.
Identifiers: Economic development, Urban poverty, Rural opposition, Rural values, Industrial development, Rural activity patterns.

Planning in rural areas is becoming increasingly important. First, there is the rising national concern with economic development of depressed rural areas. Second, there is recognition that urban poverty and related problems are, at least in part, a consequence of conditions in rural areas. Finally, the outward movement of dissatisfied urbanities is extending beyond areas that can accurately be called suburban, and into countryside and jurisdictions that are rural. These trends result in demands on the planning profession for application of its methods and expertise to rural communities. Nevertheless, planning in rural areas is often unsuccessful. A major obstacle is the recalcitrance of rural citizens, leaders, and government. Their acceptance of planning as an appropriate local public activity is absent, or half-hearted at best. The purpose of this paper is to explore reasons for this and suggest some solutions. It draws heavily on the experience with a regional development educational project in the Central New York Region, a five-county area around Syracuse, New York. This article may prove helpful to the planner involved with water resources development in rural areas. (Loeb-Rutgers)

NATURAL RESOURCES AND RESEARCH ADMINISTRATION,
Economic Research Service, Washington, D.C.
George A. Pavelis.
Journal of Soil and Water Conservation, Vol 24, No 4, p 127-131, July-August 1969. 16 ref.

Descriptors: *Natural resources, Management, Planning, Environment, Decision making, Economics, Communication.
Identifiers: *Research administration, Research, Resource management, Objectives, Cooperation.

Natural resource professionals often ask how public research organizations can focus their talents and resources more precisely on the realities of solving practical management problems. They question why decades of continuing and publicly supported research in all areas of agricultural science at state universities and by the U S Department of Agriculture have not produced a body of knowledge and experience specific and versatile enough to solve most problems encountered. These questions encompass the larger matter of how research and planning are related elements in determining how our natural environment should be managed. The author concludes that important avenues of improvement lie in clearly defining the objectives sought in making management decisions or in setting up research studies, in developing analytical information tailored to these objectives, and in developing responsive research organizations. The catalyst for progress in all three directions are free communications and cooperation among conservation minded individuals, planning technicians, their research associates in universities and government agencies, and the research organizations themselves. A METHOD TO ANALYZE THE EFFECTS OF FLUCTUATING RESERVOIR WATER LEVELS ON SHORELINE RECREATION USE,
Waterloo Univ. (Ontario).
Reiner Jaakson.
Water Resources Research Vol. 6, No. 2, p. 421-529.

Descriptors: *Reservoirs, *Recreation, *Floods, *Water level, Optimization, Economic justification, River basins, Planning, Dams, Water supply, Data collections, Mapping, Beaches, Beach erosion, Computers, Maximization.
Identifiers: Buffalo Pound Lake, Lake Diefenbaker, Backshore.

This paper presents a method whereby the optimum water level for a reservoir can be identified based on an analysis of recreation potential of the shoreline at different lake levels. The author feels that the recreation segment of many multipurpose projects forms one of the more active basic economic catalysts for regional growth and that this justifies the maintenance of constant or near constant levels during the recreation season. The three stages involved in the analysis were field data collection, mapping and quantification. The methodology allows economic comparisons of the value of maintaining constant lake levels with the value of maintaining flood storage levels. (Murphy-Rutgers)

THE CONVENTIONAL WISDOM IN WATER PHILOSOPHY,
University of Southern California, Los Angeles; and Arizona State Univ., Tempe.
John M. Bruner, and Martin T. Farris.
Water Resources Bulletin, Vol 5, No 4, p 43-48, December 1969. 5 ref.

Descriptors: *Water policy, Investment, Water utilization, Water management, Water supply, Demand, Prices, Water allocation, Economics.
Identifiers: *Conventional wisdom, *Water philosophy, Water projects, Water images.

The National Academy of Sciences recently warned against the commitment of substantial investment funds for water projects without careful consideration of scientific, engineering, economic, and social perspectives which, in their estimation, should qualify major water management decisions. There is little doubt that investments are being made and contracted for that do not auger well for economic development. The objective of this paper is to attempt a partial explanation of actual and potential inefficiencies in water management by describing and lending empirical support to the existence of a barrier to effective water management. This barrier can be termed 'conventional wisdom in water philosophy.' The contention here is that for a variety of reasons, a conventional wisdom regarding water has evolved, and that it has crystalized into a widely held philosophy toward water that has exceedingly important policy implications. In addition, it appears that the principal effect of this philosophy is to limit the range of choice in water policy proposals, and to introduce a predisposition toward certain types of proposals to the exclusion of others. (Loeb-Rutgers)

entifiers: *St. Louis, Missouri, *Production func-on, Labor, Industrial development, Fiscal health.

his paper attempts a consideration of local urban overnments and presents an urban public services rojection model and a regional planning model to valuate alternative plans in terms of their net fiscal ealth results. Input-output techniques are em-oyed in each model. This article is of interest to ie water researcher not only for its discussion of ater and sewerage services, but also for the ieoretical insight it provides in the use of input-utput techniques for regional planning purposes. he first model treats government as a productive gent and assumes the existence of a linear omogenious production function. The local overnment services are disaggregated, according uniformity of demand into five sectors, one of hich is the water and sewerage sector. Using St. ouis, Missouri as a case study, control totals for ach sector were estimated, inputs allocated to the pplying industrial sector and output allocated to ie service recipients. Another model is then resented which seeks to explain the implications f exogenous and local private sector forces for scal health of the government. In the first stage ie impact of changes in final demand on output nd income is estimated with the second stage esti-ating the revenue and expenditure implications. Murphy-Rutgers)

This paper examines the problem of social choice along the lines developed by Arrow. All configura-ions, or states of the economy, that can be com-pared in terms of preference and indifference by in-dividuals are socially ordered. Then the question of whether or not to undertake a particular public project can be settled by using the social ordering to compare, in terms of social preference and indif-ference, the configurations that would accompany the two options. Ideally a society could use the so-cial ordering to choose the best of all feasible con-figurations. Arrow's technique of requiring the so-cial ordering to depend upon the indifference maps of the individual economic units and to satisfy cer-tain conditions claimed to be generally accepted are used. This paper derives the existence of a class of social orderings, each member of which satisfies two fundamental democratic requirements as well as Arrow's conditions 1, 2, 4, and 5 and a weak ver-sion of his Condition 3. Only orderings in a slightly more general class satisfy all of the seven condi-tions. The use of social ordering criteria is made implicitly in the water area when deciding whether or not to undertake a particular public project. (Loeb-Rutgers)

THE CONSISTENCY AND EFFICIENCY OF GENERALIZED LEAST SQUARES IN SIMULTANEOUS EQUATION SYSTEM WITH AUTOCORRELATED ERRORS,
Bristol Univ. (England).
M. R. Wickens.
Econometrica, Vol 37, No 4, p 651-659, October 1969. 12 ref, 1 append.

Descriptors: Statistical methods, Economics.
Identifiers: *Consistency, *Efficiency, *Generalized least squares, *Simultaneous equations, *Autocorrelated errors, Autoregressive process, Two stage least squares, Three stage least squares, Estimators, Madansky type estimator.

Several existing single equation estimators, designed for the case where the structural disturbances are generated by a first order autoregressive process, are generalized for situations where the autoregressive process is of higher order than one. These generalized estimators are shown to be consistent, both when the parameters of the generating process are known and unknown, and their asymptotic relative efficiencies are compared. Three full information estimators are also examined. They are shown to be consistent with asymptotic efficiencies ranked like their single equation counterparts. Among the results derived are the consistency of 2SLS and 3SLS in this situation and the overall relative efficiencies of the 'Theil-Fisher' type estimators compared with the 2SLS-3SLS and 'Madansky' type estimators. This article is of general interest to water research projects employing simultaneous equation models of estimation. (Author)

BEHAVIOR TOWARDS RISK WITH MANY COMMODITIES,
Yale Univ., New Haven, Conn.
Joseph E. Stiglitz.
Econometrica, Vol 37, No 4, p 660-667, October 1969. 1 fig.

Descriptors: *Behavior, *Risks, Prices, Income, Economics, Social values.
Identifiers: *Commodities, *Indifference map, Consumer behavior, Risk neutral, Price ratios, Utility, Consumer behavior, Ordinal utility, Cardinal utility, Quadratic utility function, Risk aversion, Engel curves, Time preference, Income-consumption curves, Bernoulli utility function.

In the recent development of the theory of consumer bahavior, there have been two seemingly disjoint strands: the ordinal utility theory of consumer's choice with many commodities and the Von Neumann-Morgenstern cardinal utility theory of consumer behavior under uncertainty where individuals maximize their expected utility. It has not been sufficiently realized how intimately related these two theories are. The purpose of this paper is to show what restrictions on the indifference map (e.g., on the income-consumption curves) are implied by alternative assumptions about consumer behavior under uncertainty and, conversely, what restrictions on consumer behavior under uncertainty are implied by alternative assumptions about the indifference map. The importance of the results obtained in this paper is threefold: first, they suggest further reasons for avoiding particular parameterizations of attitudes towards risk. Second, they provide a way of ascertaining some information about an individual's attitudes towards risks by looking at Engel curves. Third, if the different commodities are interpreted as consumption in different periods, then the techniques developed here can be used to infer restrictions on consumer time preference from certain assumptions about saving behavior under uncertainty and vice-versa. This would prove useful in the water area when investigating demands for water supplies under conditions of risk and uncertainty. (Loeb-Rutgers)

ECONOMICS AND A NEW SOCIAL SCIENCE THRESHOLD,
Resources for the Future, Inc., Washington, D.C.
Edgar S. Dunn, Jr.
Southern Economic Journal, Vol 36, No 4, p 353-364, April 1970. 9 ref.

Descriptors: Economies, Resources, Diffusion.
Identifiers: *Social science, Developmental problems, Metaphors, Growth, Information, Stage theory, Social system learning, Evolution, Social learning.

The author contends that the major social problems of our era are developmental problems and these are exacerbated by the inbalance in our understanding and practice of the process of social learning as it applies to deterministic physical systems in contrast with nondeterministic creative social systems. This condition is further exacerbated by our adherence to several limited, if not unrealistic, metaphors of social change. A science paradigm is emerging that sees the classical experimental method and the classical science metaphor as demonstrating limited applicability to the more general task of problem solving associated with social system development. The emerging social learning metaphor is trying to make manifest a more general and inclusive process of evolutionary experimentation that is more nearly identifiable with the root process of social system problem solving. The author contends that if economies is to continue making contributions to the domain of economic and social development, it must apply itself to the task of improving our understanding and practice of the process of social system learning. This general reasoning could be extended to the economics of the water area as it relates to the social system. (Loeb-Rutgers)

AN ECONOMICALLY MEANINGFUL AND WORKABLE SYSTEM FOR CALCULATING FLOOD INSURANCE RATES,
Chicago Univ., Ill.
Howard Kunreuther, and John Sheaffer.
Water Resources Research Vol 6, No 2, p 659-667, April 1970.

Descriptors: *Flood plain insurance, *Risks, *Floods damage, Cost, River, Economic efficiency, Flood frequency, River basin, Management, Government supports, Social aspects, Statistics, Flood-proofing.
Identifiers: *Flood Insurance Act, *Insurance rates.

This paper focuses attention on the operating issues related to the establishment of flood insurance premiums for individual residential structures. The proposition presented is that rates on new as well as on existing houses can be determined quickly and economically on the basis of individual characteristics and conditions rather than on an average rate for a widely varying zone. An individual rating basis would not require a change in the dual system of premiums, acturial rates for new structures and subsidized rates for existing structures, provided for in the Flood Insurance Act of 1968. The customizing of individual rates will eliminate the adverse selection feature of the present method where damage is averaged over a region and may also expedite the extension of flood insurance coverage. (Murphy-Rutgers)

MULTIDIMENSIONAL RISK AND THE MODIGLIANI-MILLER HYPOTHESIS,
Robert W. Resek.
The Journal of Finance Vol. XXV No 1, p 47-51, March 1970.

Descriptors: *Capital, *Costs, Debt, Risk, Economic evaluation, Optimization, Interest rate, Investment, Forecasting, Efficiency, Taxes.
Identifiers: *Modigliani-Miller Hypothesis, *Dept equity ratio, *Leverage, Bonds, Stocks, Default.

What is known as the Modifliani-Miller hypothesis states that the average cost of capital to any firm is completely independent of its capital structure. This has obvious implications for firms in the water

resource area with large capital investment and a long paypback period. The paper considers this proposition and shows that, under the general circumstances hypothesized by its authors the proposition in not true. They consider the different ways of raising capital and, because of the possibility of default on bonds in a world with taxes find the cost of capital to a firm likely to be affected by its financial structure. The conclusions of this paper point out the necessity for the water resource utility to consider varying its financial structure to minimize capital costs. (Murphy-Rutgers)

ENVIRONMENTAL PROBLEMS,
Rutgers - The State Univ., New Brunswick, N.J.
Betty Ray Wilson.
Philadelphia, J. B. Lippincott Co. 1968, 183 p.

Descriptors: *Thermal pollution, *Water quality, *Environmental effects, Air pollution, Data processing, Pesticides, Desalination, Government, Financing, Fish, Management, Herbicides, Costs, Insecticides, Rivers, Population, Radiation, Waste disposal, Wells, Transportation, Reservoir, D.D.T., Urban renewal, Model studies.
Identifiers: Environmental synergisms, Housing.

This book is the result of a conference at Rutgers University on April 24 to 26, 1967 and concerned with encouraging college faculties to stimulate students to enter into careers in the environmental area. The book represents a selection of problems currently important and representative of the entire field of environmental quality control. It discusses the nature of environmental health sciences, the dimensions, issues and determinants of urban development, the overall behavior of man in his society and the problem and effects of pesticides in the environment. Of particular interest for the water researcher are the chapters dealing with the economic, biological and physical problems involved in thermal pollution and its effect on the environment. The book concludes with two chapters on the problem of environmental synergisms. (Murphy-Rutgers)

WATER FOR THE YEAR 2000,
Lawrence Burgess.
American Water Works Association Journal, Vol 62, April 1970, p 211-214.

Descriptors: *Water resources development, *Natural resources, *Non-structural alternatives, *Planning, Water demand, Water supply, Legislation, Cities, Area development, Federal government, Multiple-purpose projects, Project purposes, Water policy, Politcal aspects, Regulation, Water quality control, Pollution abatement, Water pollution, Water Quality Act, Water Resources Planning Act, Costs, Environmental effects, Ecology, Population, Aesthetics.

Water resources were first developed in the United States by private interests seeking to promote small-scale enterprises. Later, the federal government began large-scale water resource development in such fields as flood control, reservoirs, channel improvement, irrigation, transportation and water power. Unfortunately, most such projects were carried out to alleviate particular water problems, and comprehensive planning for water resource development was frequently missing. The river basin approach did not effectively integrate agriculture, mining, forests and urban areas in the development. In planning for future needs, more comprehensive planning is imperative. Consideration must be given not only to meeting the greater demand for water but to relating water resource development to standards of environmental quality. Consideration must be given such aspects of the environment as aesthetics, pollution abatement, and the prevention of overcrowding. Technology must serve, not dictate future development. (Hubener-Florida)

ON THE CHOICE OF RISK LEVELS IN MANAGERIAL DECISION-MAKING,
Kent State Univ., Ohio.
B. L. Myers, and A. J. Melcher.
Management Science: Applic, Vol 16, No 6, p B-31-B-39, Oct 1969. 5 tab, 15 ref.

Descriptors: Risks, Management, Decision making, Planning, Costs, Variables.
Identifiers: Alpha and beta values, Errors.

The purpose of the study was to develop a set of factors which would enable on to answer questions regarding specific alpha and beta values, whether they should be large or small errors, and to what kinds of decisions are the errors related. The set of factors found useful in thinking through the difficulties encountered were: (1) number of alternatives, (2) planning horizon, (3) past success of decision-maker, and (4) cost-revenue consequences of an action. The difference between the expected costs of proposed projects and the expected costs associated with reducing error levels was highlighted since the difference has led to some confusion in establishing error levels. It was hypothesized that several variables may be used to generate the error levels. (Kriss-Cornell)

RATIONAL URBAN PLANNING: PROBLEMS AND PROSPECTS,
Darwin G. Stuart.
Urban Affairs Quarterly, Vol 5, No 2, p 151-182, Dec 1969. 1 fig, 32 ref.

Descriptors: *Planning, *Mathematical models, Budgeting, *Constraints, Economics, Resources, Programs, *Analytical techniques, *Decision-making.
Identifiers: Rational Urban Planning, Goals, Urban problems, Community objectives.

The efficiency of comprehensive rational planning as a strategy for dealing with complex urban problems was examined. Implications of six basic steps involved in this rational process, in terms of the practical problems and tasks involved, were discussed. First, community objectives were identified. Then existing government programs and policies were cited. The basic analytic framework and mathematical models were developed for inputs and outputs. Relative goal achievement was stratified according to effected economic activities, social groups and spatial locations. Weights were assigned to community objectives and finally preferred alternatives were identifiedsubject to budget constraints. Many difficulties and weaknesses were identified because ofthe enormous informational requirements of the method. As an alternative the Lindbom Strategy of 'successive limited comparison' or 'disjointed incrementalism' was presented as a behavioral method of governmental, policy-making. Objectives and policies are chosen at the same time. Finally, a third general model which represents a middle-range compromise between the other two was proposed as a program-policy trade-off model. Using the Model Cities Program as an example, it was recommended as a workable alternative to comprehensive rational planning. Has 31 references. (Kriss-Cornell)

HYDROLOGIC ENGINEERING TECHNIQUES FOR REGIONAL WATER RESOURCES PLANNING,
Corps of Engineers, Davis, Calif. Hydrologic Engineering Center.
Augustine J. Fredrich, and Edward F. Hawkins.
Water Resources Bulletin, Vol 6, No 2, p 249-260, March-April 1970. 4 fig, 12 ref.

Descriptors: *Hydrology, *Engineering, *Regional analysis, *Planning, *Computers, Reservoirs, Water resources development, Hydrographs, California, Northeast USA, Missouri, River Basin.

The Hydrologic Engineering Center has been involved in aiding in the development of some hydrologic techniques for use in regional planning studies. Most of the new techniques emphasize computational procedures developed specifically for use with electronic computers. Many studies have been recently completed or are in progress. Three such studies were dealt with in detail. First, the initial effort in regional analysis was the formulation of procedures for determining standard flood estimates for southern California coastal streams using generalized criteria. Techniques developed were readily adaptable to the computer and determined representative unit hydrographs, losses and standard project precipitation for any location in the study area. As a result of the recent drought in the Northeastern United States, a study was made to evaluate present and future water supply reservoirs in that region. The study consisted of computerized studies of the hypothetical operation of a large number of reservoirs as a system. They were on many different streams throughout the region and had varying constraints. A third example given was the development of a computer-aided screening procedure for use in evaluating several hundred potential reservoir sites for the Missouri River Basin Comprehensive Framework study. Physical, hydrologic and climatologic data in estimating reservoir storage requirements throughout the basin were used. From this study there seem to be many potential areas of application for new hydrologic engineering techniques for use in regional water resources planning. (Kriss-Cornell)

UTILITY MEASUREMENT IN PUBLIC HEALTH DECISION MAKING,
California Univ., Berkeley.
David H. Stimson.
Management Science: Applic, Vol 16, No 2, Oct 1969, p B-17-B-30. 14 p, 1 tab, 3 fig, 44 ref.

Descriptors: *Decision making, *Resource allocation, *Model studies.
Identifiers: Tasks, Objectives, Maximizing effectiveness.

The Churchman-Ackoff approximate measure of value method was used to measure the utilities of objectives of decision makers in a large public health agency. The utilities thus obtained formed part of a model of a resource allocation problem faced by the agency in its role as allocator of a federal grant. A comparison of the normative solution derived from the model with the solution already decided upon by the agency tended to support the hypothesis that the members of the agency chose among alternatives as if they were maximizing expected utility. The first task given to the subjects used in the experiment was the assigning of values to seven objects used in the model. The second task was to compare the assignment of numerical values to objectives implicit in the choices of the first task with the ratings of the objectives in the second task in order to get a unique set of values for the objectives. The third task was designed to obtain the efficiency of each alternative to achieve each objective. The criterion used for the selection of alternatives in the model was the maximization of effectiveness. (Kriss-Cornell)

PRIME-ALBERTA'S BLUEPRINT FOR WATER DEVELOPMENT,
Department of Agriculture, Edmonton (Alberta). Water Resources Div.
Reginald E. Bailey.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 227-234, 1969. 3 fig.

Descriptors: *Water resources development, *Inter-basin transfers, Water conveyance, Water transfer, Water management (Applied), Planning, Irrigation water, Domestic water, Municipal water, Industrial water, Water supply.
Identifiers: *Alberta (Canada).

The program of the Alberta Water Resources Division to guide the development of the province's water resources is described. The greatest requirements for water are in southern Alberta where irrigation, industrial, domestic and municipal demands are well established. The largest rivers, however, are in the north carrying their water to the Arctic Ocean away from the centers of population. About 89 percent of the total water flowing through Alberta is carried by these northward flowing rivers. The remaining 11 percent must serve 85 percent of the population. The solution to this problem of distribution is the diversion of northern waters southward where they are more urgently needed. Basin by basin, a transfer of northern waters to the south is planned. In many cases short gravity diversions are possible. In all cases only surplus water from storage reservoirs will be diverted, thus protecting downstream users dependent upon present supplies. NEW JERSEY WATER SUPPLY COMM'N V STATE WATER POLICY COMM'N (WATER RATES FOR SURFACE AND SUBSURFACE WATER SUPPLIES).

129 N J L 326, 29 A2d 617-620 (1943).

Descriptors: *New Jersey, *Water rates, *Subsurface waters, *Water supply, Legislation, Diversion, Cities, Regulation, Judicial decisions, Legal aspects, State governments, Administrative agencies, Rivers, Water management (Applied), Local governments, Water allocation (Policy), Eminent domain, Water utilization, Percolating water, Wells, Surface waters.

Defendant commission pursuant to statute passed two resolutions establishing: (1) a minimum rate to be charged for the diversion of surface water in excess of a statutory minimum; and (2) fixing a different rate for water diverted from subsurface, well or percolating water supplies. Plaintiffs, public bodies organized for the purpose of providing a public water supply, objected to the Commission's resolutions. It was contended that the rate exceeded that allowed by law. Plaintiffs also argued that the statute was unconstitutionally discriminatory in not providing a uniform rate for both the diversion of surface and subsurface waters. Upon consideration of the statute involved, the court held that the commission had fixed a rate in excess of that allowed by law for the diversion of waters. However, the statute was constitutional in that there was such a substantial difference between the respective conditions relating to surface and subsurface waters as would sustain a difference in rate for diversion from each. THE RELEVANCE OF BENEFIT COST ANALYSIS FOR ECONOMIC DEVELOPMENT,
Rhode Island Univ., Kingston.
David W. Fischer.
Engineering Economist, Vol 15, No 2, p 63-80, Winter 1970. 18 p, 20 ref.

Descriptors: *Benefit-cost ratios, Economics, Project planning, Costs, Foreign countries, Bibliographies, United States, *Social values, Public works, Payments, Investment, Decision making, Projects, Theory.
Identifiers: *Benefit-cost analysis, *Economic growth, Incentives, Developing countries.

The Western World's benefit-cost analysis is assumed a viable concept for planning economic development. Such an analysis relies heavily upon a theoretical base bearing little relationship to the overall context of development decisionmaking. An effort is made to denote the factors distorting the theoretical results of benefit-cost analysis. The structure of the economy obviates the direct applicability of such models; the values inherent in the Western World's benefit-cost approach rest in the economic context where they were formulated, with hidden costs for underdeveloped economies. COST-SHARING FOR FEDERAL WATER RESOURCE PROGRAMS WITH EMPHASIS ON FLOOD PROTECTION,
Central Connecticut State Coll., New Britain.
James C. Loughlin.
Water Resources Research Vol 6, No 2, p 366-382, April 1970.

Descriptors: *Cost-sharing, *Government, *Water resource development, Optimization, Economic efficiency, Project costs, Planning, Flood control, Federal government, Financing, Water law, Benefits, Cost-benefit analysis, Recreation, Drainage, Reservoirs, Economic justification.
Identifiers: *Equity, *Efficiency, *Cost distributions.

The purpose of this paper is to highlight the inefficiencies and inequities that can arise under existing cost-sharing provisions for federally assisted water resource programs. The author points out that differences in cost-sharing may cause (1) other than the least-cost alternative to be chosen; (2) the optimal scale may not be chosen; and (3) there may be less than optimal use of existing capacity. The equity problems of differing cost-sharing arrangements include: (1) DIFFERING PATTERNS OF REIMBURSABLE COST DISTRIBUTIONS FOR SIMILAR PROGRAMS, (2) the tilting of project costs toward nonreimbursable functions, and (3) the arbitrary nature of existing cost-sharing provisions. Case studies pertaining to flood control are presented to illustrate several of the above points. A uniform cost-sharing policy for flood protection is also proposed. (Murphy-Rutgers)

A WELL SUPPLY IS BEST FOR VICKSBURG,
Allen and Hoshall, Memphis, Tenn.
Lorin B. Allen.
The American City Vol LXXXV, No 5, p 125-129, May 1970.

Descriptors: *Costs, *Economic evaluation, *Water supply, *Rivers, *Well water, Transportation, Filtration, Water quality, Pollution, Hardness, Treatment cost, Benefits, Temperature, Aeration, Filtration, Lime, Reservoir, Instrumentation, Storage, Soil analysis.
Identifiers: *Vicksburg, Consistency, Automation

This paper discussed the economic and hydrological factors involved in the choice between using a well or a river as the municipal water supply in the city of Vicksburg, Mississippi. The cost of the well water was found to be greater than that of the river. However, the quality of the well water was better and more consistent than that of the river and was less susceptable to the possibility of future pollution. In addition, the well water made for simpler plant control, thus cost-benefit analysis dictated that well water be used. The treatment process is described in detail with special attention given to the plant design and distribution system. (Murphy-Rutgers)

STRUCTURE OF PUBLICLY-OWNED WATER UTILITIES,
Fristoe Goddard Keig.
American Water Works Association Journal, Vol 62, Apr 1970, p 215-219.

Descriptors: *Public utilities, *Water works, *Municipal water, *Cities, Urbanization, Water rates, Water utilization, Local governments, State governments, Legislation, Use rates, Costs, Economics, Budgeting, Cost sharing, Water policy, Comparative costs, Financing, Administration, Taxes, Political aspects, Coordination, Supervisory control (Power).

The vast majority of water systems serving municipalities in the United States are publicly owned and regulated primarily by city councils. These councils must approve the budget, rate structure, and extension policies of the utility. Except as to extension policies outside city limits and the rates charged in those areas, very few states regulate municipally-owned water utilities. Some problems arise in attempting to operate the municipal water systems as business enterprises. There are problems of coordination and cooperation with other departments whose functions involve use of municipal water. Often the necessary cooperation is lacking. Secondly, a municipal water system may be used to subsidize other governmental functions, thus reducing the expansion capability of the system and affecting its ability to set fair rates. There are also problems with political influence in personnel policies, extension policies and rate determination. The foregoing problems are not as prevalent in independently owned or state-regulated utilities. (Hubener-Florida)

IS WATER DIFFERENT,
Department of Energy, Mines and Resources, Ottawa (Ontario). Policy and Planning Branch.
Frank Quinn.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, 1969, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 243-246, 1969. 9 ref.

Descriptors: *Water distribution (Applied), *Water allocation (Policy), *Water law, *Administration, *Water policy, Water demand, Water utilization, Equitable apportionment, Legal aspects, Planning, Water rights, Water requirements.
Identifiers: *Water resources policy.

At one time, most of nature's resources were made readily available to users on the Western frontier, as part of a public policy which encouraged settlement and development. Today only water remains so free to its developers and, at the same time, so dependent on governmental regulation. The costs of manipulating this resource which appears and reappears through the range of competing human pursuits and natural balances, have indeed become more, rather than less, difficult to evaluate. Analogies may be expedient; but it appears at best premature, and at worst irresponsible, to suggest that water can be marketed as a commodity essentially no different from a bushel of wheat or a barrel of oil. CHESAPEAKE AND O RY V SALYER (ACTION FOR DAMAGES CAUSED BY PERMANENT STRUCTURE BARRED BY STATUTE OF LIMITATIONS).

272 Ky 171, 113 SW2d 1152-1158 (1938)

Descriptors: *Kentucky, *Flood damage, *Obstruction to flow, *Bridges, Judicial decisions, Legal aspects, Damages, Overflow, Floods, Streamflow, Flow, Streams, Backwater, Structural members, Piles (Foundations), Structures, Barriers, Dams, Structural design, Railroads, Legislation, Land tenure, Remedies.
Identifiers: *Statutes of limitation.

In an action for damages caused by overflow of water, plaintiffs alleged that defendant railroad company's bridge was so improperly constructed as to create an accumulation of drift and debris in a creek thereunder. This accumulation and the resultant obstruction to flow caused a water backup which inundated plaintiffs' lands. Defendant argued that plaintiffs' action was barred by a statute of limitation requiring suit to be brought within five years of the initial damage. The Court of Appeals of Kentucky stated that the statute operated as a bar only where a single recovery was required for all damages, past and future. The statute would not run where recurring recoveries for recurring damages were possible. Where a permanent structure is negligently constructed and cannot be reasonably repaired to avoid recurring injuries, there must be a single and not recurring recoveries. Plaintiffs had proceeded under the theory that the bridge was such a permanent structure incapable of repair. Since plaintiffs could obtain only a single recovery under such theory, this action was held barred by the statute of limitation. (Snow-Florida)

HOBAN V BUCKLIN (PRESCRIPTIVE RIGHTS TO LAKE SHORE).

184 A 362-369 (N H 1936).

Descriptors: *New Hampshire, *Lake shores, *Prescriptive rights, *Recreation, Lake beds, Lakes, Public rights, Boating, Swimming, Navigation, Navigable waters, Remedies, Legal aspects, Judicial decisions, Structures, Docks, Shores, Recreation facilities, Land use, Right-of-way, easements, Relative rights, Land tenure, Real property.
Identifiers: *Injunction (Temporary).

Plaintiff operated a boys camp during the summer season. Incident to the camp's operation, plaintiff used a lake and a portion of the abutting land thereto located on the opposite side of a highway from the camp. Plaintiff's grantor had constructed a wharf and boathouse over the lakebed, which plaintiff used in conjunction with swimming and boating. To that portion of the lakefront which was used in connection with his camp, plaintiff claimed a prescriptive right. Plaintiff contended that his non-occupancy during the periods when the camp was not open could not alone interrupt his continued possession. He did not voluntarily abandon such possession nor did defendant, who claimed title to the property, actually disturb plaintiff's exercise of his right-of-way. The court permitted plaintiff to tack the period of his grantor's adverse use of the lake and adjoining property onto his own holding periods, finding that plaintiff's rights had ripened into an easement by prescription. The court refused to enjoin any temporary trespass, as a legal remedy at law was available to defendant. (Finman-Florida)

Identifiers: *England, *Water Resources Act, River Authority, Licensing.

This study describes and evaluates the policy and institutional aspects of the British system of water management. The legal powers, the administrative structure and the provisions for the financing of water resources are described in historical context with the aim of determing if they provide an institutional setting favorable to water management. As a basis for the evaluation, the concept of water management is examined and elaborated. Its characteristics and the conditions necessary for its effective pursuit are identified and institutional criteria are proposed. The monograph was presented in the belief that the British experience may be instructive in the search for effective policies and institutions to deal with water use and development in the large urbanizing regions of the United States. DANFORTH V UNITED STATES (TAKING OF LAND FOR LEVEE CONSTRUCTION).

105 F2d 318-321 (8th Cir 1939).

Descriptors: *Missouri, *Mississippi River, *Levees, *Easements, Alluvium, Floods, Flood control, Flood protection, Embankments, Legislation, Judicial decisions, Legal aspects, Federal government, Land tenure, Mississippi River Basin, Historic flood, Floodways, Diversion structures, Damages, Diversion.

Appellant owned land a few miles inland from the Mississippi River. The federal government constructed levees on a part of appellant's land to aid in flood control. Appellant contended that this was a taking of his property within the provisions of the Mississippi River Flood Control Act of 1928. The Act provided for purchase of flowage rights for 'additional destructive flood waters that will pass by reason of diversions from the main channel of the Mississippi River.' The court, in holding for the United States, stated that the construction of a set-back levee did not constitute a taking of appellant's property. Further, the government acquired a flowage easement over appellant's lands for water that would be diverted there by the set-back levee. The levee would not divert any additional water from the main channel of the river and, therefore, appellant was not entitled to compensation under the Act. (Hubener-Florida)

LYNN V UNITED STATES (EMINENT DOMAIN: COMPENSATION FOR OBSTRUCTION OF LAND DRAINAGE CAUSED BY INCREASED BACKWATER LEVEL).
110 F2d 586-590 (5th Cir 1940).

Descriptors: *Drainage, *Subsurface drainage, *Backwater, *Eminent domain, Dams, Subsurface runoff, Tennessee, Tennessee River, Tennessee Valley Authority Project, Federal government,

looding, Project planning, Surface drainage, rainage waters, Watersheds (Basins), Surface runoff, Relative rights, Judicial decisions, Drainage ystems, Compensation, Obstruction to flow, iddance (Legal aspects), Repulsion (Legal spects), Easements, Water level fluctuations.

n an action to recover the value of easements, laintiff contended that the United States had, by aising the level of the backwater of a Tennessee 'alley Authority dam, obstructed the drainage of is land. The land was drained by a system of natual underground caves, by underground drains, and y surface drainage. The obstruction caused surace water to be impounded so as to permanently amage his property. Plaintiff contended that he ad an implied easement to discharge his drains hrough lands previously deeded by him to the Jnited States and that obstruction to drainage mounted to the taking of property, the easement, vithout compensation. The court held that plaintiff lid have an easement and that such was property vhich could not be taken without compensation. Iowever, the United States, in exercising its power ver navigable streams, may raise the level thereof nd thereby obstruct the drainage of surface waters n nearby lands. Even though damages occur, the and is not taken, in the constitutional sense, unless he waters of the river are backed upon the land. The damages caused by the obstruction to the drainage was not a taking of property, and plaintiff was not entitled to compensation. (Snow-Florida)
W70-08749

UNITED STATES V BAILEY (REAL PROPERTY VALUATION IN CONDEMNATION PROCEEDINGS FOR TENNESSEE VALLEY AUTHORITY PROJECT).
115 F2d 433-434 (5th Cir 1940).

Descriptors: *Tennessee Valley Authority Project, *Condemnation, *Property values, *Land appraisal, Federal government, Judicial decisions, Adjudication procedure, Legal aspects, Eminent domain, Condemnation, Governments, Value, Compensation, United States, Crop production, Evaluation, Real property, Land use, Forests, Land, Cultivated lands, Irrigable land, Arable land.

Plaintiff United States government proceeded against defendant landowner to condemn land for use by the Tennessee Valley Authority. The sole issue was the value of three tracts of land, which were a mixture of creek bottom land, timber land, open hillside and minimal improvements or cultivation. Although defendant contended that the land was suitable for cultivation, his failure to cultivate it for 38 years supported plaintiff's evidence that the best use of the land was for growing timber. Lacking evidence of similar sales involving willing buyers and sellers, the court held that evidence of prices paid by plaintiff in similar nearby condemnation proceedings was inadmissable. The award made by the commissioners appointed by the district court was affirmed. (Liptak-Florida)
W70-08750

UNITED STATES V WEST VIRGINIA POWER CO (LEGALITY OF MULTIPLE PURPOSE PROJECT CONSTRUCTED PURSUANT TO EXECUTIVE ORDER).
122 F2d 733-739 (4th Cir 1941).

Descriptors: *West Virginia, *Eminent domain, *Federal project policy, *Condemnation, Flood control, Reservoirs, Dams, Water conservation, Channel improvement, Navigation, Federal government, Watershed management, Judicial decisions, Legal aspects, River regulation, Watercourses (Legal), Legislation, Compensation, Electric power production, Standards, Projects.

Petitioner United States brought action against the West Virginia Power Company to condemn land for the erection of a flood control, power and navigation dam and reservoir. Defendants contended that the executive order to construct the project was void, as the project had neither been authorized by Congress nor had it met the recommendations of the Chief of Engineers of the Army. Defendants further contended that the project was unconstitutional since it was a multiple purpose project. The court held that the executive order authorizing the project was not bound by the conditions within the recommendations of the Chief of Engineers, and consequently the order was valid. Furthermore, in subsequent legislation the project had been approved by Congress. The project was, therefore, within the requirements of the National Industrial Recovery Act. The project was held not to be affected by certain requirements pertaining to state-federal cooperation as it had been specifically exempted by Congress. In addition, the court held that it is for Congress to determine what type of project will best serve the constitutional purpose it is pursuing. The judgment for defendants was reversed, and the lower court ordered to pass on the government's motion for immediate possession. (Price-Florida)
W70-08751

UNITED STATES V TILLEY (THE RIGHT TO SEEPAGE AND THE ASSIGNMENT OF APPROPRIATIVE RIGHTS).
124 F2d 850-864 (8th Cir 1941).

Descriptors: *Nebraska, *Appropriation, *Federal-state water rights conflicts, *Seepage, United States, Federal government, Judicial decisions, Legal aspects, Legislation, Natural flow doctrine, Preferences (Water rights), Prior appropriation, Public rights, Relative rights, State governments, Federal jurisdiction, Unappropriated waters, Watercourses (Legal), Irrigation, Irrigation systems, Irrigation programs, Return flow, Water reuse, Reclamation, Contracts.
Identifiers: *Public waters.

Two issues involving federal-state water rights conflicts were raised by this case: (1) whether defendant engineer for the state of Nebraska had transfered to plaintiff United States its appropriative rights to the natural flow waters of the North Platte River; and (2) whether defendant had the right to interfere with plaintiff's collection of seepage waters from irrigation lands located in plaintiff's North Platte Irrigation Project. Plaintiff and defendant had entered into a contract wherein plaintiff had agreed to release from its stored sources into the North Platte River an amount of water which, added to the water defendant would be entitled to be appropriation, would aggregate 180,000 acre feet per year. Delivery of such water would be accepted as full satisfaction of all of defendant's right to water of the North Platte River. The court held that since the contract did not expressly assign defendant's appropriative rights to plaintiff, the contract did not transfer such rights to plaintiff. As to the second issue, the court held that Nebraska law allowed an appropriator of public waters for use in an irrigation project to collect seepage waters upon any land under such project and to re-use them. The United States, as any other appropriator, was protected by this law. (Clarke-Florida)
W70-08752

UNITED STATES V ELLIOTT (OWNERSHIP OF BEDS OF NON-NAVIGABLE WATERS).

131 F2d 720-724 (10th Cir 1942).

Descriptors: *United States, *Boundary disputes, *Ownership of beds, *Riparian rights, Boundaries (Property), Contracts, Federal government, Federal jurisdiction, Judicial decisions, Land tenure, Legal aspects, Legislation, Proprietary power, Public rights, Relative rights, Reservation doctrine, Riparian land, Riparian waters, Usufructuary right, Non-navigable waters, Islands, Rivers.

In 1832 defendant United States granted to the Seneca Nation a tract of land whose boundary on the east was described as 'all land on the west side of the Grand River, a non-navigable stream.' Plaintiff acquired from the Senecas title to an island entirely located west of the midline of the river. Defendant claimed that such title was invalid because the land granted to the Senecas extended only as far as the west bank of the river. The court held that a grant of land bounded on a non-navigable stream carries the exclusive right and title of the grantee to the center of the stream unless the terms of the grant clearly denote the intention to stop at the edge of the stream. The language of the treaty did not indicate such an intent. Consequently, plaintiff's title to the island was upheld. (Clarke-Florida)
W70-08753

UNITED STATES V COMMODORE PARK, INC (RIGHT OF THE UNITED STATES TO TAKE PROPERTY FOR THE IMPROVEMENT OF NAVIGATION).
324 US 386, 65 S Ct 803-806 (1945).

Descriptors: *United States, *Virginia, *Riparian land, *Riparian rights, Federal government, Streams, Alteration of flow, Dredging, Navigation, Eminent domain, Landfills, Real property, Judicial decisions, Legal aspects, Dams, Shores, Planning, Non-structural alternatives, Regulation, Compensation, Fishing, Tidal waters, High water mark, Low water mark, Navigable waters.

Defendant United States conducted a dredging operation in a tidewater navigable bay and deposited the dredged matter in a navigable arm of the bay, thereby destroying its navigability. Plaintiff, who owned property along the arm, brought action for damages resulting from the 'taking' of his riparian right of access to the navigable waters. Defendant's answer alleged that plaintiff's riparian right of access to the navigable waters was subordinate to the government's plenary authority over navigable waters of the United States in aid of navigation or commerce. The district court held the entire project had no substantial relation to navigation or commerce and awarded damages for plaintiff. The Circuit Court of Appeals affirmed, but the United States Supreme Court reversed, stating that the dredging was done in aid of navigation and that the United States does have the power to control and regulate navigable waters in the interest of navigation and commerce without payment of compensation. As against the demands of commerce, riparian landowners whose lands are invaded have no right for compensation for the loss of access to navigable waters even though such loss may cause a decrease in the value of their property. (Barnett-Florida)
W70-08754

STEWARD V UNITED STATES (TITLE TO SWAMP LAND ADJACENT TO GOVERNMENT HOLDINGS).
316 US 354, 62 S Ct 1154-1159 (1942).

Descriptors: *United States, *Islands, *Tidal marshes, *Boundary disputes, Land tenure, Boundaries (Property), Bays, Marshes, Swamps, Bodies of water, Coastal marshes, California, Governments, Legislation, Federal government, Public lands, Relative rights, Judicial decisions, Legal aspects, Military aspects, Beds under water, Surveys, Mapping, Real property.
Identifiers: *Swamp Lands Act of 1850.

The United States sought to quiet title to an area of tule marsh adjacent to an island owned by the government in a bay. The government had purchased title to the island and claimed that the land in question was part of the purchase because it was joined to the island by a narrow neck. Defendants claimed title to the swamp under the Swamp Lands Act of 1850 and argued that it was not part of the original grant under which the government claimed title to the island. Defendant claimed that the connecting neck was often under water at high tide, and therefore the government's claim could not extend to land beyond the high water mark. The U. S. Supreme Court, accepting the findings of

fact of the trial court, found that the government's claim ran only to the high water mark and thus did not extend to the area separated by high tide from the island. The Circuit Court decision for the government was reversed. (Barker-Florida)
W70-08755

UNITED STATES V CHICAGO, M, ST P AND P RR (FEDERAL COMPENSATION FOR CONDEMNATION OF FLOODED LANDS BELOW HIGH WATER MARK: IMPROVEMENT OF NAVIGATION).

312 US 592, 313 US 543, 61 S Ct 772-776 (1941).

Descriptors: *United States, *Condemnation, *Navigable rivers, *Compensation, Eminent domain, Mississippi River, Right-of-way, Riparian rights, Riprap, Bank protection, Embankments, Shore protection, Navigable waters, Navigation, Railroads, Water levels, High water mark, Low water mark, Easements, Relative rights, Ownership of beds, Judicial decisions, Legal aspects, Flooding, Federal government.

Plaintiff United States brought a condemnation action to acquire the right to flood a right-of-way and embankment owned by defendant railroad companies. Plaintiff claimed the right through its power over commerce and navigability of rivers. Defendants operated a railroad track and telegraph line on the west bank of the Mississippi River, and part of their right-of-way lay between the high and low water marks. Defendants claimed ownership to the low water mark and argued that the government must compensate them if the water level was raised through a plan to improve the navigability of the river. The government claimed the right to raise the water level to the ordinary high water mark without compensation to riparian owners. The U. S. Supreme Court held that the government's interest in navigation included all the lands below the high water mark and that exercise of power within those limits was not an interference with private property rights. No compensation was awarded. (Barker-Florida)
W70-08756

UNITED STATES V APPALACHIAN ELECTRIC POWER CO (DAM CONSTRUCTION: INTERFERENCE WITH NAVIGATION AND COMMERCE).
311 US 377, 61 S Ct 291-312 (1940).

Descriptors: *United States, *Navigable rivers, *Hydroelectric project licensing, *Dam construction, Interstate, Governments, Administrative agencies, State governments, Interstate rivers, Surface waters, Electric power, Legislation, Legal aspects, Political aspects, Navigation, Damsites, Virginia, West Virginia, Hydroelectric plants, Judicial decisions, Multiple-purpose projects, Dams, Supervisory control (Power), Navigable waters, Eminent domain.

The United States sought to enjoin the construction of a dam and an electric power plant on a river which flowed through Virginia and West Virginia. The United States claimed the construction was proceeding without the grant of a license for such by the Federal Power Commission pursuant to control by the federal government over navigable rivers and interstate commerce. Defendant electric power company argued that the river was not navigable and thus no license was required. Defendant further argued that even if the river were navigable and the license were necessary, the provisions of the license as offered were illegal and unconstitutional in that they usurped state regulation and amounted to an uncompensated taking. The United States Supreme Court found that the river was navigable and that the provisions of the license were wholly within the bounds of congressional control over navigation and interstate commerce. The lower court decisions in favor of defendant were reversed. (Barker-Florida)
W70-08757

CHESEBRO V LOS ANGELES COUNTY FLOOD CONTROL DIST (ASSESSMENTS OF LANDS BY DRAINAGE DISTRICTS).
306 US 459 S Ct 622-625 (1939).

Descriptors: *United States, *Drainage districts, *Assessments, *Costs, Judicial decisions, Legal aspects, Administrative agencies, Flood control, Operation and Maintenance, Regulation, Benefits, Drainage systems, Financing, Taxes, Legislation, California, Cost allocation.

Plaintiff owned taxable real property within defendant flood control district but outside certain drainage districts that were transferred to defendant pursuant to statute. Plaintiff contended that the statute, which authorized the administrative board of the district to levy special assessments on his land within the flood control district for the purpose of paying the debts and obligations of other special assessment districts without regard to the accrual of benefits to the lands assessed, would deprive him of his property without due process of law in violation of the 14th amendment. From a denial by the Supreme Court of California to restrain this assessment on his land, plaintiff appealed to the Supreme Court of the United States. In affirming, the Supreme Court held that in the absence of flagrant abuse or purely arbitrary action, a state may establish local districts to include lands that it finds will be specially benefited by drainage, flood control or other such improvements. Furthermore, to acquire, construct, maintain and operate such burdens on those lands deemed benefited. (Barnett-Florida)
W70-08758

IN RE COUNTY DITCH NO 50, FARIBAULT COUNTY (PARTIES DIRECTLY AND INDIRECTLY AFFECTED BY LATERAL DRAIN AND DITCH IMPROVEMENT PROCEEDINGS).
177 NW2d 54-56 (Minn 1970).

Descriptors: *Minnesota, *Laterals, *Ditches, *Adjudication procedure, Drains, Drainage, Administrative agencies, Administrative decisions, Tile drainage, Tile drains, Tiles, Surface drainage, Surface runoff, Surface waters, Local governments, Judicial decisions, Runoff, Outlets, Outlet works, Drainage effects, Water control, Legal aspects, Riddance (Legal aspects), Land tenure, Remedies.
Identifiers: *Improvements (Drainage).

Plaintiff landowners appealed from an order of defendant county commission approving construction of a lateral drain which sould empty into an existing county ditch. Plaintiffs contended that the existing ditch, which adjoined their property, was inadequate to handle the increased flow of water from the proposed lateral drain, thereby requiring that they be given statutory notice of improvement proceedings and an opportunity to intervene. Defendant contended that plaintiffs were only indirectly affected and that only those who lived alongside the proposed lateral drain were proper parties to improvement proceedings. The court discussed and distinguished apparently conflicting authority and held that plaintiffs were only indirectly affected by the proposed drain and were not proper parties to improvement proceedings since the lateral drain would replace an existing private tile drain. If, however, the lateral drain had required a new outlet into the existing ditch, landowners along the ditch would be proper parties and notice would be required. The court also noted that plaintiffs still had an adequate remedy through petition for separate proceedings for improvement of the existing ditch. (Liptak-Florida)
W70-08759

PIGORSH V FAHNER (RIGHT TO USE AND OWNERSHIP OF NON-NAVIGABLE WATERS).

177 NW2d 466-470 (Mich Ct App 1970).

Descriptors: *Michigan, *Public rights, *Riparian rights, *Non-navigable waters, Easements, Judicial decisions, Legal aspects, Legislation, Local governments, Ownership of beds, Preferences (Water rights), Prescriptive rights, Proprietary power, Recreation, Relative rights, Riparian land, Riparian waters, State governments, Usufructuary right, Water rights, Watercourses (Legal), Lakes, Navigable waters.

Plaintiffs fenced off the entrance road to their private lake. They had allowed their friends and neighbors access to the lake, without express permission, for more than ten years. Defendant city officials removed the fence, contending that plaintiffs had dedicated the road to public use. Plaintiffs sought to enjoin defendants from further similar action. While suit was pending, plaintiffs spread dirt fill into the lake. The state then intervened as a party defendant on two grounds: (1) that plaintiffs violated a statute requiring a permit to deposit dirt fill in any navigable water body, and (2) that the public had a right to use of the lake for recreational purposes because it was navigable. The court refused both the state's contentions, holding that the term navigable waters means waters capable of being used by the public as thoroughfares for the purposes of commerce, travel and transportation. Plaintiff's lake was landlocked, and consequently was subject to their exclusive use and possession. It was clearly non-navigable and not subject to public use. The court further held that the access road may well have been dedicated to public use, but since its only useful purpose was to provide access to the lake, which was inacessible to the public, defendants could have no valid reason to pursue this claim. (Clarke-Florida)
W70-08760

ESSEX CO V GOLDMAN (ENFORCEMENT OF COVENANT TO PURCHASE WATER).
258 NE2d 526-530 (Mass 1970).

Descriptors: *Massachusetts, *Water costs, *Rent, *Industrial water, Water users, Water demand, Costs, Mills, Industrial plants, Facilities, Canals, Dam design, Surface waters, Mill dams, Water supply, Land use, Judicial decisions, Legal aspects, Canal design, Canal construction, Water utilization.

Plaintiff dam owner and water supplier sought enforcement of a covenant to pay rent for water supplied by plaintiff to land owners. Plaintiff had built a dam and canals in order to supply water for mill operation and had created a perpetual covenant for the rents to run with the land where the mills were located. Defendants, ultimate grantees of the land on which a mill was located, who did not use the water for mill operation, argued that the covenant was personal to the original grantees and thus not in force as to them. Defendants further claimed that abandonment of the use of land for mill operation constituted a radical change and that therefore the covenant was not binding. The Supreme Judicial Court of Massachusetts, affirming the trial decision for plaintiff, ruled that the covenant to pay rent for water ran with the land and was not personal in nature. The court also held that non-use of the water for mill power was not an abandonment since the water was still used for industrial purposes. (Barker-Florida)

IOYER V NEW YORK (WATER SEEPAGE AMAGE FROM STATE BARGE CANAL PERATIONS).

) NYS2d 203-208 (Ct Cl 1944).

escriptors: *New York, *New York State Barge anal, *Explosives, *Canal seepage, Damages, eepage, Dams, Dikes, Canals, Drainage, Ditches, urface drainage, Construction, Operations, Land se, Farms, Judicial decisions, Remedies, Legal spects, Excavation, Crop production, Adjudica- on procedure, State governments, Maintenance.
lentifiers: Negligence, Causes (Legal).

laintiff landowners sought to recover damages to ieir property allegedly caused by defendant's egligent operation of the New York State Barge anal. Plaintiffs claimed that water seepage from rainage ditches which flowed into the Canal was aused by defendant's blasting operations and ailure to properly maintain the ditches. It was urther alleged that such seepage diminished the roductivity of plaintiffs' property. Defendant ar- ued that its blasting in constructing a distant dike ould not have affected the ditches and further laimed that title to the ditches had been trans- erred long before the seepage occured, thus relieving the state of maintenance responsibility. The Court of Claims of New York, dismissing plaintiffs' laim, ruled that in an action for water seepage damage from negligent operations of a canal, it must be shown that the state's operation directly contributed to the damage. The court held that the evidence was insufficient to support the claim. (Barker-Fla)
W70-08763

IN RE WATERFRONT AND HARBOR, EAST RIVER, BOROUGH OF MANHATTAN, CITY OF NEW YORK (COMPENSATION FOR CONDEMNATION).

268 App Div 131, 49 NYS2d 474-477 (1944).

Descriptors: *New York, *Cities, *Condemnation, *Riparian rights, Condemnation value, Compensation, Eminent domain, Legal aspects, Value, Water resources development, City planning, Riparian land, Governments, Construction, Docks, Relative rights, Highways, Road construction, Land use, Remedies, Judicial decisions, Property values.

In a condemnation proceeding by the City of New York for the construction of a marginal street to improve the waterfront, the landowners affected complained of uncompensated damage. Although the original plan for the marginal street was the basis of the condemnation, the landowners showed that the city contemplated a further taking in order to construct an elevated street. It was shown that the additional taking changed the property of the landowners from waterfront to inland property. The Supreme Court of New York, Appellate Division, ruled that where the original condemnation plan for the construction of a marginal street to improve the waterfront also contemplated a further taking for the construction of an elevated highway, waterfront property owners whose land was thus changed to inland property were entitled to compensation for the extinguishment of their riparian rights. (Barker-Florida)
W70-08764

NIGHTINGALE V STATE (CLAIM FOR DAMAGES DUE TO EROSION CAUSED BY CANAL OPERATION).
46 NYS2d 525-528 (Ct Cl 1944).

Descriptors: *New York, *Erosion, *Alteration of flow, *New York State Barge Canal, Canals, Damages, Remedies, State governments, Streams, Diversion, Jucicial decisions, Legal aspects, Flow rates, Legislation, Flow augmentation, Land tenure, Water transfer, Bank erosion, Accretion (Legal aspects), Intake gates, Structures, Bank erosion, Adjudication procedure.

Plaintiffs claimed that increased flow through the New York State Barge Canal had resulted in erosion of plaintiff's land adjoining the canal. The court found that, while some of the increased flow was due to seasonal rainfall, the state had contributed to the flow by diverting additional water from a near-by stream. The court held that it was unnecessary to show negligent operation of the canal; plaintiffs needed only show that through the use and management of the canal the state had damaged them. This was proven to the court's satisfaction. The fact that some part of the damage had resulted from natural causes was held not to be a bar to recovery. However, the damages had to be apportioned between natural causes and state canal operation. As the damage was a continuing wrong, plaintiffs were not bound by a short statute of limitations. The court allowed recovery. (Caldwell-Florida)
W70-08765

IN RE WATERFRONT AND HARBOR OF CITY OF NEW YORK (MUNICIPAL ACQUISITION OF WATERFRONT PROPERTY).
30 NYS2d 187-192 (Sup Ct 1941).

Descriptors: *New York, *Cities, *Condemnation, *Bulkheads, Eminent domain, Damages, Legal aspects, Rivers, Cranes, Docks, Bulkhead line, City planning, Water resources development, Legislation, Governments, Judicial decisions, Land tenure, Project planning, Remedies, Piers, Condemnation value.

The city of New York brought proceedings for the acquisition of waterfront property on the East River. The city based its action on a resolution which recommended the acquisition for the purpose of a marginal street in the interests of commerce and navigation. Owners of the property objected and argued that the proceeding was in fact one of condemnation, under which the city should offer compensation for interference with their bulkhead rights. The original bulkhead grants contained the rights of wharfage and cranage. The city claimed that because those rights had never been exercised, there was no interference therewith. The Supreme Court of New York ruled that the action was not one of condemnation, but also held that damage was done the landowners when the city took away their bulkhead rights. Therefore, the city had to pay for those damages. (Barker-Florida)
W70-08766

ROBB V STATE (NEGLIGENT CANAL STRUCTURE AS CAUSING SEEPAGE FLOODING GRAVEL PITS).
262 App Div 37, 28 NYS2d 107-108 (1941).

Descriptors: *New York, *Groundwater movement, *Canal construction, *Canal seepage, Percolation, Flood damage, Canal embankments, Groundwater barriers, Overlying proprietor, Surface-groundwater relationships, Legal aspects, Judicial decisions, Water table, Damages, Drainage, Gravels, Land tenure, Relative rights, Canals.

Plaintiff landowner claimed that negligent construction and maintenance of defendant's nearby canal had caused canal waters to seep onto his farm and flood gravel pits thereon. The trial court found that the canal seepage had raised the water level and had prevented normal drainage of plaintiff's land and gravel pit. Reversing per curiam, the appellate court held that the evidence established only that canal waters exerted pressure upon the soil beneath the canal. Such pressure prevented the groundwater from normally draining beneath the plaintiff's land. Under such circumstances, an adjacent landowner is not liable for interference with underground waters. (Caldwell-Florida)
W70-08767

VANNECK REALTY CORP V CITY OF NEW YORK (CONDEMNATION OF RIPARIAN LAND).
259 App Div 461, 19 NYS2d 544-546 (1940).

Descriptors: *New York, *Condemnation, *Compensation, *Legislation, Local governments, Riparian rights, Boundaries (Property), Eminent domain, Judicial decisions, Legal aspects, Land tenure, Proprietary power, Public rights, Relative rights, Riparian land, Riparian waters, Usufructuary right, Remedies, Highways, Condemnation value.
Identifiers: *Injunction (Prohibitory).

Plaintiff realty corporation sought to enjoin defendant city from condemning a strip of land between plaintiff's land and the East River. Plaintiff claimed that it would be deprived of riparian and wharfage rights appurtenant to its land without just compensation unless the proceedings were enjoined. Plaintiff alleged that defendant intended to use the land for a highway, yet it was proceeding under a section of the Administrative Code which related to acquisition of land for wharf purposes and other improvement of waterfront. The court held that the constitutional right to just compensation for property taken could not be flouted by a taking under the guise of an improvement, if, in fact, the taking contemplates another use. There was no reason, however, why the condemnation court could not consider all matters relevant to the question of whether plaintiff's property, including its riparian and wharfage rights, were being interfered with, even though the taking was for highway purposes. The court dismissed plaintiff's complaint without prejudice to further action. (Clarke-Florida)
W70-08768

HASKELL V STATE (NEGLIGENT OPERATION OF FLOOD CONTROL FACILITIES).

258 App Div 930, 16 NYS2d 550-551 (1939).

Descriptors: *New York, *Flood control, *Flood damage, *Dam failure, Judicial decisions, Legal aspects, Public rights, Relative rights, Riparian land, Riparian waters, Riparian rights, State governments, Usufructuary right, State governments, Watercourses (Legal), Dams, Floods, Lakes, Rivers.

The court concluded per curiam, without a statement of the facts, that damage to plaintiff's cottage property on the shore of Oneida Lake resulted from defendant state's inadequate and negligently maintained flood control facilities at its dam on the Oneida River. (Clarke-Florida)
W70-08769

BENNETT V DELAWARE COUNTY (ACTION TO FORCE CITY AND COUNTY GOVERNMENTS TO REBUILD A WASHED-OUT BRIDGE).
172 Misc 463, 15 NYS2d 591-597 (Sup Ct 1939).

Descriptors: *New York, *Bridge construction, *Local governments, *Remedies, Bridge failure, Flood damage, Bridges, Legislation, Judicial decisions, Legal aspects, Condemnation, Washouts, Cities, Institutional constraints, Streams, Land tenure, Maintenance, Adjudication procedure, Repairing.

Plaintiff, owner of land on both sides of a stream, sought to force defendant city and county governments to rebuild a bridge which had been washed out. The bridge had been the only connection between the two segments of plaintiff's land. Plaintiff argued that the destruction had the same effect as if the bridge had been withdrawn from use by condemnation for unfitness, in which case the

counties were obligated to repair it. The court rejected this argument, and held that the plaintiff could not prevail against the counties concerned since, by statute, the duty to maintain and repair bridges in the area was placed upon the municipalities. The plaintiff could force the municipal government to rebuild the bridge; however, his remedy was an administrative one under a statute providing for petition to the municipality. This remedy was exclusive so that the present action could not be maintained. (Caldwell-Florid)
W70-08770

NEW YORK WATER SERVICE CORP V WATER POWER AND CONTROL COMM'N OF DEP'T OF CONSERVATION.
257 App Div 590, 13 NYS2d 760-765 (1939).

Descriptors: *New York, *Water supply, *Well permits, *Administrative decisions, Water utilization, Groundwater, Legislation, Cities, Judicial decisions, Legal aspects, Domestic water, Water wells, Well regulations, Administrative agencies, Water demand, Water shortage, Decision making, Public benefits, Equitable apportionment, Saline water intrusion, Subsurface waters, Water table, Local governments, Drawdown, Water allocation (Policy).

Petitioner, a public water company, applied to the defendant Commission for temporary authorization to sink wells. This request was grounded on decreased capacity of existing wells due to saline water intrusion and deficient rainfall. The petition was denied, the Commission holding that the request was not justified by public necessity, and that to grant the petition would be inequitable to other municipalities. The court, noting that the Commission had made no factual findings, pointed to expert testimony to the effect that the water supply of Nassau County, which objected to the petition, would not be harmed. Also, the minimum daily water supply in the area was stated to be 165 million gallons daily, while the maximum use, even with the proposed new wells, would be 70 million gallons daily. Any lowering of the water table was stated to be due more to decreased rainfall than to any new consumption of groundwater. Therefore, the court annulled the Commission's decision as arbitrary and capricious, and remanded for further proceedings. (Caldwell-Florida)

HASKELL V STATE (LIABILITY FOR DAMAGES CAUSED BY INADEQUATE DAM DESIGN).
13 NYS2d 192-197 (Ct Cl 1939).

Descriptors: *New York, *State governments, *Flood damage, *Dam design, Judicial decisions, Legal aspects, Natural flow doctrine, Public benefits, Riparian land, Riparian rights, Riparian waters, Usufructuary right, Watercourses (Legal), Flood control, Damages, Overflow, Floodgates, Concrete structures, Dams, Flood protection, Floods, Rainfall, Dam failure, Canals.

Defendant state constructed a dam at the point where Oneida Lake flowed into the Oneida River. The dam contained no floodgates, and during heavy rains much of the riparian land surrounding the lake was flooded. As a result of ensuing damage claims, defendant built floodgates in the dam, and later enlarged them. Plaintiff owned land adjacent to the lake, and during a particularly heavy rainy season, his land was flooded. Plaintiff brought action for damages, claiming that defendant had raised the level of the lake by constructing the dam and had negligently failed to provide for adequate flood control. Defendant claimed that the improved floodgates constituted an adequate flood control device and that plaintiff's land was flooded by excessive rainfall and accumulated surface waters. The court found from the evidence that the floodgates were much too small and inadequate for effective flood control and that defendant had kept the gates partially closed during the heavy rainfall. The court held that lack of adequate flood control measures by defendant caused the flooding of plaintiff's land, and consequently defendant was liable for flood damages resulting thereto. NEW YORK WATER SERV CORP V WATER POWER AND CONTROL COMM'N OF DEP'T OF CONSERVATION (REVIEW OF DECISION DENYING WELL PERMITS TO WATER COMPANY).
9 NYS2d 301-302 and 9 NYS2d 302-303 (Sup Ct 1939).

Descriptors: *New York, *Well permits, *Administrative decisions, *Drawdown, Wells, Administrative agencies, Water demand, Legal aspects, Judicial decisions, Cities, Public benefits, Water supply, Water wells, Decision making, Groundwater, Water allocation (Policy), Well regulations, Public utilities, Local governments, State governments.

Petitioner, a public water company, applied to respondent Commission for the sinking of additional wells to enable it to supply water to its customers. New York City and others filed objections on the grounds that granting such permits would deprive certain city residents of their natural water resources and that the amounts proposed to be taken would exceed the available groundwater capacity of the area. The Commission determined that, upon consideration of the present and future needs for water sources in that area, the proposed plans were unjustified. Holding that the proof submitted in connection with the objections was sufficient, the court affirmed the Commission's determination. (Caldwell-Florida)

IN RE NEPTUNE AVE IN CITY OF NEW YORK (DAMAGES IN CONDEMNATION PROCEEDINGS).
254 App Div 690, 3 NYS2d 825-827 (1938).

Descriptors: *New York, *Cities, *Condemnation value, *Riparian rights, Condemnation, Compensation, Eminent domain, Legal aspects, Value, Appraisals, Water resources development, City planning, Riparian land, Structures, Construction, Governments, Judicial decisions, Permits, Administrative agencies, Regulation, Easements, Relative rights, Remedies.

In a condemnation proceeding by City of New York to acquire title to waterfront property, landowners objected to the appraisals as inadequate. One landowner claimed special damages for the removal of a restaurant he had erected on such waterfront property. The landowner contended that such construction was a valid exercise of his riparian rights and that he had been issued a building permit by the dock commissioner. The Supreme Court of New York held that the appraisals were not sufficiently inadequate to warrant a reversal of the awards by the trial court. As to the restaurant owner, the court ruled that erection of such structure was not a proper exercise of riparian rights, that a permit allowing such construction was beyond the authority of the dock commissioner, and that even if the permit had been legal, it was revocable at will and thus conveyed no right, privilege, or easement which was taken away by the condemnation proceedings. The trial court's judgements were affirmed. (Barker-Florida)

MOYNEHAN V STATE (ESTABLISHING THE STATE'S LIABILITY FOR FLOOD DAMAGE).
1 NYS2d 907-908 (Ct Cl 1938).

Descriptors: *New York, *Overflow, *Creeks, *Rainfall intensity, Rain, Rainfall, Artificial watercourses, Backwater, Canals, Cutoff, Flooding, Non-navigable waters, Obstruction to flow, Streams, Cultivated lands, Natural flow, Water conveyance, Water spreading, Legal aspects, Judicial decisions, Watercourses (Legal), Rainfall-runoff relationships, Flood damage, Damages

Plaintiff's cultivated land was flooded and damaged when a creek, abutting her property and flowing into a canal built by defendant state, overflowed during heavy rains. Plaintiff filed her claim in negligence and trespass against defendant for damages, alleging that the flooding was due to water backing out of the canal into the creek, causing it to overflow. The court stated that to create legal liability against the state, facts must be proved that would create legal liability against an individual or a corporation in like circumstances. There can be no recovery for damages resulting from a public improvement effected under legislation authority in the absence of any trespass or negligence. The court found that defendant had no control over the creek, and consequently could not be held responsible for the damages resulting from overflow without proof of some wrongful act on its part. The court held that the burden of establishing defendant's liability was on plaintiff, and such burden had not been met. The court further held that the overflow and flooding had been caused by the heavy rains. (Price-Florida)

LOHMEYER V STATE (FLOOD DAMAGE CAUSED BY DEBRIS BLOCKING ARCHWAY OF STATE AQUEDUCT).
299 NYS 681-682 (App Div 1937).

Descriptors: *New York, *Aqueducts, *Obstruction to flow, *Flood damage, Damages, Canals, Administrative agencies, Floods, Legal aspects, Judicial decisions, Flow, Flooding, Overflow, State governments, Water conveyance.

Defendant state had maintained a certain aqueduct over the Erie Canal for many years. Over a period of time, several of the archways over the canal became clogged with sand, gravel and other debris. When floodwaters were backed up by the obstruction onto plaintiffs' land, they brought suit for damages. The appellate court held per curiam that the evidence was sufficient to establish that the canal authorities had known about the condition and had been negligent in removing it. The lower court judgment for the plaintiffs was affirmed. (Caldwell-Florida)

NORTHERN NEW YORK POWER CORP V STATE (CLAIMS ARISING FROM DAM CONSTRUCTION WHICH NECESSITATED REBUILDING OF A POWERPLANT).
298 NYS 688-717 (Ct Cl 1937).

Descriptors: *New York, *Canals, *Dams, *Hydroelectric plants, Water utilization, Water rights, Industrial use (Water), Relative rights, Legal aspects, Judicial decisions, Eminent domain, Land tenure, Riparian land, Rivers, Governments, Water allocation (Policy), Compensation, Low flow augmentation, Outlets, Surplus water, Hydraulics, Damages, Water level fluctuations, Intake gates, Power head, Water levels.

Defendant state constructed a new dam to replace its old one across a canal. This necessitated the rebuilding of plaintiff's powerplant to take advantage of the increased operating head provided by the raised water level. Plaintiff claimed damages. The court granted damages for 2 parcels of land taken by the dam construction, but disallowed plaintiff's claim for his expense in relocating and rebuilding his powerplant. Such consequential damages were compensable, the court held, but must be balanced against the benefits the plaintiff received from the new dam. The higher head and increased aperture of the new dam had increased the power potential of plaintiff's mill to such an extent as to more than offset any possible damage. The state filed a cross-claim, alleging that plaintiff was entitled to use only so much water as could

scape through the apertures of the old dam, and ought to charge plaintiff for the excess over that mount he had used from the new dam. The court enied this claim, holding that plaintiff had a right o use all the surplus waters not actually needed for he operation of the canal. (Caldwell-Florida)
V70-08777

ELL V CITY OF NEW YORK (INJUNCTION GAINST BUILDERS OF A SEWER IN A ANAL TO PREVENT DESTRUCTION OF IPARIAN RIGHTS).
50 App Div 564, 294 NYS 852-855 (1937).

escriptors: *New York, *Sewers, *Canals, Riparian rights, Competing uses, Judicial decisions, Legal aspects, Damages, Riparian land, iparian water, Navigable water, Navigation, ewage, Construction, Obstruction to flow, Adjudiation procedure, Cities, Local governments.

laintiff owner and plaintiff lessee of property onting on a canal sought to enjoin defendants, lew York City and its contractor, from laying a ewer in the canal. It was contended that the sewer as to be constructed in such a way as to interfere ith plaintiffs' riparian rights. Plaintiffs alleged that he sewer pipe was being placed at a depth which ould obstruct the free and proper use of the canal nd thereby lessen the value of the plaintiffs' proerty. Defendant contended plaintiffs had not alged sufficient facts to show that the construction f the sewer interfered with their rights of navigaon. The appellate court held that the plaintiffs did ot need to plead the exact measurements of the ewer, that the facts pleaded were sufficient, and hat the lower court had improperly dismissed the omplaint. The judgment below was reversed. Price-Florida)

IOMES, INC V ANDERSON (RIGHT TO DIRECT DRAINAGE WATER ALONG NATUAL COURSE OF FLOW).
35 So 2d 680-684 (Miss 1970).

Descriptors: *Mississippi, *Drainage systems, Natural flow, *Drainage effects, Surface drainage, Construction, Dams, Ponds, Real property, Land enure, Judicial decisions, Legal aspects, Rainfall, Excessive precipitation, Surface runoff, Riddance (Legal aspects), Silting, Drainage water, Conrolled drainage, Relative rights, Remedies.

Defendant owned land adjacent to and at a higher levation than plaintiff's land. In preparation for onstruction of a subdivision, defendant cleared his and and installed a drainage system. The drainage ystem directed surface waters along a watercourse o a pond on plaintiff's land. After heavy rains nuch silt was washed into the pond and damaged a lam which was part of the pond. Plaintiff sought lamages and an injunction requiring alteration of he drainage system so that none of its waters would be directed across plaintiff's land. The lower court held for plaintiff, but the Mississippi supreme court reversed. The court found that the drainage system in no way changed the course of natural drainage flow and only drained defendant's land more efficiently. An upper landowner may increase the flow of drainage water off his land as long as he does not gather it into an artificial channel. Further, plaintiff's damages were cuased by unprecedented heavy rainfalls. That, together with the fact that plaintiff prevented defendant from repairing the dam at gunpoint, precluded any damages. (Hubener-Florida)
W70-08779

BALLARD FISH AND OYSTER CO V GLASER CONSTR CO (COMPENSATION FOR TAKING OF PRIVATE PROPERTY).
424 F2d 473-475 (4th Cir 1970).

Descriptors: *Virginia, *Eminent domain, *Condemnation, *Federal jurisdiction, Compensation, Oysters, Aquatic life, Commercial shellfish, Rivers, Natural gas, Construction, Judicial decisions, Legal aspects, Adjudication procedure, State governments, Right-of-way, Easements, Relative rights.
Identifiers: *Oyster bed.

Plaintiff brought action against defendants, a construction company and natural gas corporation, for damages caused by the laying of a gas pipeline through plaintiff's oyster bed in the James River. Plaintiff alleged that defendants had been authorized by the state to exercise the power of eminant domain, and the occupancy of the oyster bed, without condemnation or acquisition of an easement, constituted an unlawful taking of private property without just compensation. The district court dismissed the action for want of a federal question. The court of appeals reversed and held that a public service corporation acts as an agent of the state when exercising the eminent domain power and must provide compensation for property which is appropriated. The occupancy of the oyster bed was not a simple trespass but a taking of property, and a federal question was raised since no provision was made by the state for payment of compensation. Plaintiff was not required to exhaust state remedies because of the absence of compensation provisions and the failure of the state to institute proceedings. (Hubener-Florida)

VILLAGE OF SCHOHARIE V COONS (ACQUISITION OF EASEMENT BY PRESCRIPTIVE RIGHT).

309 NYS2d 545-547 (App Div 1970).

Descriptors: *New York, *Cities, *Conduits, *Tile drains, Drainage systems, Prescriptive rights, Easements, Legal aspects, Judicial decisions, Drainage water, Surface waters, Water conveyance, Waste water disposal, Land tenure, Relative rights, Discharge (Water), Surface runoff, Flooding, Local governments.

Defendant purchased a tract of land in plaintiff village. Defendant subsequently discovered a tile conduit running across his land which formed part of the surface drainage system of the village. Defendant complained to plaintiff that the tile was discharging detergent from a nearby laundry as well as drainage water onto his land, but received no response. Thereupon, defendant took his bulldozer, crushed the tile and buried it. After flooding occurred because of the destruction of the conduit, plaintiff brought action to require restoration of the conduit, contending that it had acquired a prescriptive easement. The lower court held that hostile, actual, notorious, exclusive and continuous possession was required to establish a prescriptive easement and that plaintiff had not established hostile possession because permission had to be presumed in the absence of written records to the contrary. The appellate court reversed, finding that the easement was hostile since the discharge of water interfered with a landowner's rights in his property. Defendant also had constructive notice of the easement and took title to the land subject to it. (Hubener-Florida)

COX V DRAINAGE DIST NO 27 (NOTICE OF HEARING BY DRAINAGE DISTRICT REQUIRED FOR ADDITIONAL ASSESSMENTS).
187 SW2d 887-891 (Ark 1945).

Descriptors: *Arkansas, *Drainage districts, *Assessments, *Adjudication procedure, Administration, Drainage systems, Judicial decisions, Governments, Legislation, Taxes, Laterals, Financing, Construction, Drains, Ditches, Pipes, Maintenance costs, Replacement costs, Planning, Public benefits, Administrative decisions, Maintenance, Administrative agencies.

Defendant drainage district filed a petition in county court stating that, in order to preserve and maintain the drainage ditches and drainage system constructed by them, it was necessary to issue bonds. The proceeds from the bonds would be used to complete the work of improving, cleaning out, deepening and widening its drains, constructing culverts and openings where needed, and performing other necessary maintenance work. In order to pay the principal and interest of these bonds, it was necessary that a tax be levied on the assessed benefits of the district. Without giving any notice of a hearing on the petition, as required by statute, the county court entered an order granting the petition. Plaintiff landowners of the district appealed to the circuit court which affirmed the county court order. The supreme court reversed, stating that if additional laterals are to be constructed, or if an additional assessments of benefits is required to pay for such improvements, the statutory requirements for notice to the property owner must be observed. OLSON V PRESTON STREET WATER DIST NO 1 (PURCHASE OF WATER PLANT OUTSIDE DISTRICT).
291 Ky 155, 163 SW2d 307-309 (1942).

Descriptors: *Kentucky, *Public utility districts, *Cities, *Municipal water, Local governments, Economics, Public utilities, Water works, Judicial decisions, Legal aspects, Planning, Water supply, Water utilization, Costs, Water costs, Water demand, Legal aspects, Legislation, Supervisory control (Power), Administrative agencies, Administrative decisions.

Plaintiff, as a taxpayer and resident in defendant water district, sued to enjoin the commissioners of the district from putting into effect a plan to buy a water plant which would supply members of the district. The plant was situated partly within and partly outside of defendant district. The court gave judgment for plaintiff, holding that state statute prohibited the district from purchasing a water supply plant that was not located wholly within the district's boundaries. The court acknowledged the many benefits purchase of the existing plant would provide, such as increased water pressure, more efficient circulation, assured sales and reduced insurance rates, and suggested that the district follow prescribed procedures to extend its boundaries. (Hubener-Florida)

NASHVILLE WATER CO V DUNLAP (EMINENT DOMAIN AS AN INDICATION OF PUBLIC PURPOSE).
138 SW2d 424-428 (Tenn 1940).

Descriptors: *Tennessee, *Eminent domain, *Administrative agencies, *Regulation, Administrative decisions, Community development, Condemnation, Contracts, Judicial decisions, Legal aspects, Legislation, Local governments, Public rights, Public benefits, Relative rights, State governments, Taxes, Public utilities, Water works.
Identifiers: *Public purpose.

Defendant, commissioner of the Public Utilities Commission, attempted to regulate plaintiff water company and to assess it for tax purposes. A state statute authorized defendant to so regulate and tax water companies as public utilities. Despite its state charter, which conferred upon it, among other things, the power of eminent domain, plaintiff contended that it was not a water company within the meaning of the statue because it acquired its pipelines from private individuals and corporations which had previously operated as real estate development organizations. The court held that the acceptance of a charter conferring powers of eminent domain is a profession of public purpose. Plaintiff's acceptance of the charter was a voluntary act, and as long as it operated under such charter, it could not claim that its properties were

not affected by a public use. Plaintiff was accordingly found to be a public water company within the meaning of the statue, and thus subject to regulation and taxation by defendant. (Clarke-Florida)

GRAVES V LITTLE TARKIO DRAINAGE DIST NO 1 (FINANCING RECLAMATION PROJECTS).

134 SW2d 70-81 (Mo 1939).

Descriptors: *Missouri, *Administrative decisions, *Drainage districts, *Land reclamation, Boundaries (Property), Community development, Legal aspects, Judicial decisions, Legislation, Proprietary power, Public benefits, Relative rights, Right-of-way, State governments, Water transfer, Taxes, Controlled drainage, Surface drainage, Ditches, Drainage systems, Flood control, Laterals, River systems, Levees, Dikes, Financing

Pursuant to a reclamation plan and statutory authority, defendant drainage district constructed several large drainage ditches and appurtenant works. Between 1910 and 1937 defendant substantially repaired and enlarged the works. The construction was paid for by warrants issued to contractors. The warrants were financed by several levies of a maintenance tax which the district supervisors were statutorily authorized to collect from landowners within the district for the purpose of repairing and improving the works. In seeking to enjoin the collection of the maintenance tax, plaintiff landowners claimed that the improvements to the works were not within the original plan of reclamation and, in fact, constituted the construction of a completely new drainage system. Defendant admitted that the improvements were more than contemplated by the original plan, but claimed that plaintiffs had had full knowledge of the construction of the system as it existed and had benefited from it for twenty-seven years. Defendant pleaded laches and estoppel. The court granted defendant's plea of laches. The court further stated that provisions of drainage acts should be construed broadly and liberally. The court found that most of the construction performed after 1910 was within the powers of the district supervisors to maintain and protect the plan for reclamation. Plantiff's injunction was denied. (Clarke-Florida)

MIDDENDORF V JAMESON (RIGHT TO ISSUE REFUNDING BONDS).
265 Ky 111, 95 SW2d 1057-1059 (1936)

Descriptors: *Kentucky, *Public utility districts, *Depression, *Assessments, Economics, Local governments, Real property, Public utilities, Water works, Judicial decisions, Legal aspects, Financing, Cities, Planning, Income, Interest, Land tenure, Water users, Water supply, Cost repayment, Debt.

Commissioners of a water district issued and sold assessment bonds to pay for the acquisition of a water plant. The bonds were payable solely out of the assessments against property in the water district. Because of the financial depression of the 1930's, the owners in the district were unable to pay assessments. This action was instituted for a declaration of the right of the board of commissioners to issue and sell refunding bonds pursuant to a state statute. The court, interpreting the statute, held that the water district was not subject to the jurisdiction of the Kentucky Public Service Commission and was empowered to issue refunding bonds payable by assessments on property within the district. (Hubener-Florida)

HOGAN V COWART (DUTY NOT TO OBSTRUCT DRAINAGE THROUGH DITCH ACQUIRED BY EASEMENT).
184 SE 884-886 (Ga 1936)

Descriptors: *Georgia, *Obstruction to flow, *Prescriptive rights, *Easements, Real property, Damages, Remedies, Judicial decisions, Legal aspects, Drainage, Drainage practices, Drainage water, Ditches, Surface waters, Excess water (Soils), Water injury, Cultivation, Flow, Relative rights, Repulsion (Legal aspects), Land tenure.
Identifiers: *Trespass (Continuing).

Plaintiff and defendant were conveyed adjoining tracts of land from a common owner. A drainage ditch extended from plaintiff's property through the adjoining land of defendant. For more than twenty years plaintiff and her predecessor in title had continuously used the ditch to drain water from plaintiff's land. By plowing over and filling it, defendant obstructed the flow of water through the ditch, thus preventing drainage of plaintiff's property. Plaintiff sought injunctive relief to prevent future obstruction of the ditch, and sought damages to cultivation caused by such obstruction. As plaintiff's adverse use of the ditch was for more than twenty years, the court found that she had acquired an easement by prescription in such ditch. In granting the injunction and damages, the court held that defendant had committed a continuing trespass in closing the ditch and was therefore liable to the extent of the injuries which plaintiff incurred as a result of the obstruction to flow. (Finman-Florida)

LEGISLATIVE DISCOURAGEMENT OF MAINE'S MARINE INDUSTRIAL GROWTH.

Maine Law Review, Vol 22, 1970. p 265-282.

Descriptors: *Maine, *Harvesting of algae, *Marine algae, *Legislation, Aquatic algae, Ecology, Aquatic plants, Aquatic life, Marine plants, Natural resources, Conservation, Submerged Lands Act, Oceans, Coasts, Beds, Submerged plants, Harvesting, Research and development, Aquatic environment, Economics, Environment.

Existing law in Maine as to the control of the cultivation, conservation, and harvesting of marine algae is embodied in its Research and Development Statute. Under this statute only a limited portion of the state's ocean floor is subject to state control over the utilization of marine algae. The vast majority of the state's ocean floor is unaffected by the statute. The author asserts that this statute is representative of Maine's inadequate and piecemeal treatment in the area of marine resources control. The author attacks Maine's laws as unprogressive and insufficient to recognize the state's responsibility in the area of developing, controlling, and utilizing the resources of its ocean floor. The author calls for a comprehensive and unified program in the entire area of marine resources so as to insure a well-organized and complete development of Maine's ocean resources. (Snow-Florida)

HUEY V STATE (NO RIGHT TO DAMAGES FOR DIVERSION OF UNDERGROUND WATER SUPPLY).
170 Misc 677, 11 NYS2d 195-198 (Ct Cl 1939).

Descriptors: *New York, *Excavation, *Underground streams, *Diversion, Water wells, Obstruction to flow, Foundations, Wells, Land, Acreage, State governments, Bridge construction, Highways, Piers, Water supply, Water demand, Water sources, Livestock, Damages, Appropriation, Right-of-way, Legal aspects, Judicial decisions, Surface waters.

Plaintiff landowner conveyed several acres of land to county authorities who provided this land to defendant state for defendant's construction of a highway. Defendant began excavating for the foundation of a bridge pier, whereupon its contractor struck quicksand and an underground stream. Plaintiff's two wells, which were located one hundred feet and two hundred fifty feet respectively from defendant's excavating operation, ran dry. In a suit for damages, plaintiff claimed the destructio of his two wells amounted to an additional ap propriation of his property and was the direct resu of defendant's construction work. Defendant mair tained its contractor was not negligent nor did h have any knowledge of an underground strean The court held plaintiff could not recover damage to his property, as defendant only performed i duly authorized work on its own right of wa Moreover, the court noted that state law denied lia bility for the diversion of underground wate where there was no adverse effect on surfac waters nearby. (Finman-Florida)
W70-08790

BD OF EDUC V TOWN OF N HEMPSTEA (LIABILITY FOR DIVERSION OF SURFAC WATERS).
259 App Div 732, 18 NYS2d 433-434 (Sup C 1940).

Descriptors: *New York, *Drainage systems *Drainage engineering, Abatement, Drainage ef fects, Remedies, Drainage practices, Drainag water, Drainage, Cities, Construction, Surfac waters, Culverts, State governments, Legal aspects Judicial decisions, Damages, Water injury, Con trolled drainage, Operations, Local governments Surface runoff.
Identifiers: *Nuisance (Continuing), *Trespas (Water).

Defendant construction company built a drainag system for defendant town pursuant to the con struction of city streets. Plaintiff school district al leged that the drainage system was a continuin nuisance, which caused surface waters to accumu late and pass over its lands. Plaintiff brought actio to abate the alleged nuisance and to enjoi trespassing upon its lands. Defendants maintaine that the waters which passed over plaintiff's land had come from a culvert constructed by the state The court stated that even if defendant construc tion company had created a nuisance from whic plaintiff had suffered, it was not liable since it ha dedicated the streets containing the drainag system to defendant town, and such dedication di not carry with it any warranties or inference tha the drainage system was to be continued in any par ticular form. Moreover, the court noted evidenc which showed that the instrumentality from whic waters were cast upon plaintiff's lands was con tructed and controlled by the state. Therefore plaintiff's injunction was denied. (Finman-Florida) W70-08791

BONDY V UTAH CONSTR CO (TUNNEL CON STRUCTION INTERFERING WITH UN DERGROUND STREAMFLOW).

23 NYS2d 125-126 (Sup Ct 1940).

Descriptors: *New York, *Underground struc tures, *Water wells, *Tunnel construction wate demand, Underground streams, Damages, Con tracts, Condemnation, Cities, Legal aspects, Judi cial decisions, Construction, Easements, Land Water supply, Water users, Water shortage Streams, Streamflow, Water injury, Tunnels, Tun neling, Remedies, Subsurface waters.
Identifiers: *Injunction (Temporary).

In order to construct a tunnel, the City of Nev York obtained a tunnel easement in condemnatio proceedings to certain subterranean lands. Defen dant contracted with the city to build such tunnel After commencement of construction by defen dant, wells on plaintiff's lands ran dry. Plaintiff were deprived of water for necessary household purposes, and their buildings were subsequentl rendered uninhabitable. Plaintiffs claimed that de fendant's activities in connection with the con struction of the tunnel caused interference with th subterranean streams of water which fed their well and, therefore, sought a temporary injunctio requiring defendant to immediately supply plain tiffs with water. The court stated that defendan

ıd done nothing except construct a tunnel accord-
g to its contract and pursuant to the right of the
ty, which was obtained in condemnation
roceedings. The rule being well-settled that the in-
rference with subterranean veins of water as the
sult of a lawful use of one's own property was
ımnum absque injuria and could not become the
ound of an action, the court held that plaintiffs
ere not entitled to a temporary injunction. (Fin-
an-Florida)

ow.

aintiff owned farm lands adjacent to defendant
ty's roadway. Prior to defendant's widening and
rfacing the road, there were adequate means of
ainage for excess surface waters that resulted
om heavy rains and from the resulting overflow of
stream which bounded plaintiff's lands. Plaintiff
leged that defendant, when improving the road-
ay, diverted the excess surface water from the
urse of its natural flow by constructing drains
ıd culverts to allow adequate drainage for the
ad. Plaintiff further alleged that defendant
egligently constructed these drainage facilities
ıd as a result caused the diverted waters to be
scharged upon his land, causing damage to the
e and his crops. Defendant contended that the
orm which caused the complained of damages
as unprecendented and constituted an 'Act of
od.' The court, in holding for plaintiff, stated that
ny natural or normal alteration of the surface of
ne's land, resulting in the casting of surface waters
pon the land of another through drains or other
rtificial channels, is a trespass for which damages
ill lie. (Barnett-Florida)

**AYLOR V STATE (RIGHT TO DIMINUTION
F RENTAL VALUE FOR FLOOD DAMAGES).**
9 NYS2d 189-190 (Ct Cl 1946).

escriptors: *New York, *Damages, *Flood
amage, *Rent, Floodwater, Flood control, Flood-
ıg, Lakes, Land, State governments, Legal
spects, Judicial decisions, Buildings, Reservoirs,
osts, Replacement costs, Value, Diversion,
Vatercourses (Legal), Water injury, Surface
aters, Percolation, Real property.

laintiff landowner sought damages to his land and
uildings due to floodwaters from a lake. There was
o question as to the liability of defendant for the
ost of restoration of plaintiff's premises. The
isputed issue was whether or not plaintiff could
eceive damages for the loss of rental of two cot-
ages as a result of such flooding. The court held
hat plaintiff was entitled to damages due to the loss
f rental of the two cottages since they had been
ustomarily used for rental purposes. Moreover,
he court stated that as a general rule, where lands
re flooded by the wrongful diversion of a water
ourse, by collection of surface waters on premises
r by percolation of waters from a reservoir,
lamages are measured by the diminution in the
ınable or rental value of the land to the time of the
ommencement of the action. (Finman-Florida)

TENNESSEE A AND G RY V CARDON (DUTY TO MAINTAIN ADEQUATE DRAINAGE AFTER CONSTRUCTION OF DITCHES).
7 Div 272, 177 So 171-172 (Ala 1937).

Descriptors: *Alabama, *Diversion, *Obstruction to flow, *Surface drainage, Embankments, Erection, Construction, Ditches, Right-of-way, Surface waters, Properties, Damages, Legal aspects, Judicial decisions, Maintenance, Drainage systems, Crops, Overflow, Overland flow, Remedies, Drainage effects, Railroads, Maintenance.
Identifiers: *Railroad roadbeds.

Defendant railroad constructed a roadbed on a right-of-way adjacent to plaintiff's upper lands. In constructing the roadbed, defendant erected embankments but also dug ditches in order to keep surface waters from backing up onto plaintiff's lands. When kept clear of obstructions, the ditches adequately drained surface waters. They became clogged, however, and as a result, surface waters were diverted back upon plaintiff's property, causing damages to his lands and destruction of his crops. Plaintiff contended that after he gave notice of such condition, defendant allowed it to remain. Therefore, plaintiff brought an action for damages. Defendant denied its liability for damages to plaintiff. The court stated that in acquiring the right-of-way, defendant secured certain rights but also assumed corresponding burdens. The court held it was defendant's duty to construct, as well as maintain, a drainage system adequate to allow free flowage of surface waters and to prevent the accumulation of such surface waters upon plaintiff's lands. Since it had failed to execute these duties, defendant was held to be liable for plaintiff's damages. (Finman-Florida)

LEHNER V KOZLOWSKI (RIGHT TO RELOCATE DRAINAGE DITCH ACROSS ADJOINING LAND).

245 Wis 262, 13 NW2d 910-913 (1944).

Descriptors: *Wisconsin, *Obstruction to flow, *Tile drains, *Drainage systems, Relocation, Contracts, Drains, Ditches, Legal aspects, Judicial decisions, Remedies, Drainage, Drainage effects, Construction, Marshes, Overflow, Surface waters, Agriculture, Culverts, Real property, Flow, Flow control, Easements, Relative rights.
Identifiers: *Trespass (Land), Injunction.

With the hope of redeeming some of his marshland for agricultural purposes, plaintiff constructed a tile drain pursuant to a written contract with defendant's predecessor in title. The drain extended from plaintiff's land across the property owned by defendant at the time of trial. In an effort to improve the drainage of surface waters, plaintiff subsequently constructed a new, open ditch across defendant's land without defendant's consent. Such construction caused surface waters to overflow onto a road running through defendant's land, thereby making such road unusable. Defendant constructed a culvert in order to maintain the road in a usable condition, and the culvert caused an obstruction to the flow of waters through the new ditch. As a consequence, plaintiff commenced suit to enjoin the obstruction. In constructing the new ditch, plaintiff contended he was acting within the scope of the written contract, which granted plaintiff an easement for the purpose of establishing a drainage system across defendant's land. The appellate court, in affirming the lower court decision for defendant, held that the contract had created a drainage easement. However, plaintiff was bound by his earlier choice of atile drain and could not construct an open ditch in a new location. In so doing, plaintiff trespassed on defendant's land. (Finman-Florida)

LAND MANAGEMENT IN MUNICIPAL WATERSHEDS,
W. W. Jeffrey, and B. C. Goodell.
American Water Works Association Journal, Vol 62, june 1970, p 380-384.

Descriptors: *Forest management, *Watershed management, *Water yield, *Land management, Reservoirs, Flooding, Clear-cutting, Vegetation effects, Recreation, Hydrologic cycle, Habitat improvement, Municipal water, Water pollution, Multiple-purpose projects, Water conservation, Public health, Water quality, Water pollution sources, Flow augmentation, Land management, Wildlife management, Lumbering, Sediment control, Watersheds (Basins), Reforestation, Evapotranspiration control.
Identifiers: *Catchments basins, *Logging.

With the need for more and better planning of watershed areas, the concept of multiple use land management has become necessary. The purpose of this concept is to combine multiple uses that are compatible on the same land areas. Emphasis herein is placed on land use in forested municipal watersheds. Timber resources are highly compatible with water production of high quality and adequate quantity. Deforestation of a watershed, in a well-planned scheme, can be beneficial by increasing the water yield of that area. The removal of trees stops the evapotranspiration process and removes the major interceptors of rain and snow, thus allowing a greater water yield. Proper synchronization of deforestation can also improve the stream-flow regime and allow for proper forest conservation as well. A major factor to guard against in such procedures, however, is the impairment of water quality by the soil disturbances associated with logging. Other safeguards against pollution sources such as herbicides, fertilizers and machinery wastes must be utilized. The recreational use of watersheds is found to be compatible with the objective of quality water production and should be prohibited. Selected experiences in timber resource management on municipal watersheds are also examined. (Barnett-Florida)

PLANNING FOR WATER QUALITY EMERGENCIES,
T. F. Craft.
American Water Works Association Journal, Vol 62, March 1970, p 181-184.

Descriptors: *Future planning (Projected), *Water pollution control, *Water management (Applied), *Water supply, Planning, Decision making, Impaired water quality, Water demand, Fluctuation, Flow control, Disasters, Watersheds (Basins), Surveys, Waste disposal, Treatment facilities, Pipelines, Water pollution, Farm wastes, Radioactive wastes, Watershed management, Water purification, Coordination, Pollution abatement, Water utilization.

Planning is essential to any type of endeavor, especially in the area of water quality control. Immediate steps should be taken by responsible persons to prepare for disasters and other emergencies which might affect the available water supply. Floods, upstream pollution and spillage of pollutants into reservoirs are examples of these items. To initiate a water quality control program, a comprehensive survey of the watershed concerned should be undertaken to pinpoint possible trouble spots. Treatment plants, pipelines, petroleum tanks and farm chemical concentrations are among items which should be included in such a survey. Steps to combat pollution from each potential source should be planned in detail, and materials adequate for any emergency should be stockpiled. Officials must be trained to recognize an emergency when

one occurs. Continual coordination between responsible persons is necessary to insure the effectiveness of any plan. (Caldwell-Florida)

AN ENVIRONMENTAL COMMON LAW FOR MICHIGAN,
Joseph L. Sax.
L Quadrrangle Notes, Vol 14, Spring, 1970, p 27-32.

Descriptors: *Michigan, *Ecology, *Remedies, *Legislation, Environmental effects, Local governments, State governments, Administrative agencies, Legal aspects, Environment, Public health, Public rights, Relative rights, Public benefits, Natural resources, Resource development, Economics, Jurisdiction, Political aspects, Adjudication procedure.

House Bill 3055, recently introduced into the Michigan state legislature, is based on a model environmental quality bill drafted by Professor Sax. The bill authorizes the Attorney General, local governments and private citizens to go into court and challenge activities which infringe upon the right of the public to a clean, healthy and attractive environment. Such a bill would serve as the basis for the creation of a body of environmental common law more flexible, innovative and responsive than existing agencies and legal remedies. Too often agencies become single-minded about the scope of their functions, and citizens are thwarted in their legal efforts either by lack of standing to sue or by judicial deference to the agencies. The proposed bill can further expand the public suit concept whereby private citizens sue on behalf of the public to enjoin public nuisances. Heretofore, such suits have been directed largely against such targets as prostitution or gambling establishments. The right to such a suit should be available to a party who can show a reasonable likelihood of an adverse effect of some particular activity on the state's resources or environment. (Hubener-Florida)

AIR AND WATER POLLUTION: WHAT TO DO WHILE WAITING FOR WASHINGTON,
John C. Esposito.
Harv Civ Rights - Civ Lib L Rev, Vol 5, p 32-52, 1970. 90 ref.

Descriptors: *Water pollution, *Air pollution, *Pollution abatement, *Water pollution control, Impaired water quality, Water pollution treatment, Water pollution sources, Treatment facilities, Water pollution effects, Legal aspects, Industrial wastes, Costs, Pollutant identification, Judicial decisions, Administrative agencies, Capital costs, Public rights, Public benefits, Environmental engineering. Environmental sanitation, Governments, Regulation, Remedies.

Efforts must be made to expand judicial remedies for air and water pollution because corrective legislation is unlikely to be forthcoming in the near future. Pollution abatement is unprofitable for corporate poluters, and so such a program must be forced on them by external pressures. Private nuisance or trespass suits brought as class actions may become effective deterrents to polluters due to the large amounts of total claims. Some cases have held that failure to keep up with recent developments in pollution control devices rendered the polluter liable for punitive damages. Using a product liability theory against producers of pollution-generating items such as automobiles might yield results. Stockholder suits also promise to be effective. Courts could take a leading role in abating pollution by closely scrutinizing administrative action and issuing mandamus and injunction writs to force necessary action. It could be argued that a constitutional right to be free from pollution exists, based on the 9th amendment and the due process clause of the 14th amendment. Traditional tendencies of courts to favor business interests would militate against these arguments, however. (Caldwell-Florida)

THE RIPARIAN RIGHTS DOCTRINE IN SOUTH CAROLINA,
Edward P. Guerard, Jr.
South Carolina Law Review, Vol 21, 1969, p 757-770. 57 ref.

Descriptors: *South Carolina, *Riparian rights, *Reasonable use, *Water rights, Water policy, Ownership of beds, Prior appropriation, Prescriptive rights, Relative rights, Riparian rights, Riparian land, Riparian waters, Water utilization, Natural flow doctrine, Competing uses, Water allocation (Policy), Water resources development, Water supply, Natural watercourses, Watercourses (Legal), Water demand, Navigable waters, Water pollution, Non-navigable waters.

The doctrine of riparian rights, as adopted by the South Carolina courts, gives an inherent right to the flow of a stream in its natural course to the owner of lands bounded or traversed by such stream. Riparian rights of a proprietor exist only as to natural watercourses, a course which has defined banks and beds, notwithstanding whether or not it may at times be dry. If a natural watercourse does exist so as to invoke the applicability of the riparian rights doctrine, the extent of these rights depends on whether the stream is navigable or non-navigable, which in turn determines the ownership of the beds of such waters. Beds of tidal navigable watercourses are property of the state subject to the rights of the federal government. The ownership of the beds of non-navigable and navigable non-tidal waters lies in the owners of the adjoining properties. The riparian doctrine is further qualified by the reasonable use doctrine which determines the extent of the right of a riparian to use the water. Each riparian has equal right to make reasonable use of water subject to equal rights of other riparians to make a reasonable use. (Snow-Florida)

THE LIMITS OF CONTINENTAL SHELF JURISDICTION: SOME POSSIBLE IMPLICATIONS OF THE NORTH SEA CASE JUDGMENT,
R. Y. Jennings.
International and Comparative Law Quarterly, Vol 18, Oct 1969, p 819-832. 28 ref.

Descriptors: *Continental shelf, *International law, *Ownership of beds, *Judicial decisions, International waters, Beds under water, Continental margin, United Nations, Legal aspects, Conferences, International commissions, Exploitation, Boundary disputes, Boundaries (Property), Adjudication procedure, Continental slope, Geology, Geomorphology, Oceans, Topography, Marine geology.

The North Sea Case has implications concerning fundamental issues of the character and limits of continental shelf jurisdiction. While the Geneva Convention on the Continental Shelf purported to define the limits of the shelf as occurring at a depth of 200 meters, general principles of international law should provide more useful definitions. The case, which resolved a dispute among several European nations and Britain over ownership of the North Sea bed, did not concern itself with general international law principles, but affects them nonetheless. Traditionally, continental shelf jurisdiction has been described as an inalienable appurtenance of the coastal state's sovereignty over its land territory. Geomorphological considerations, that is, the physical identity between land and continental shelf, are of primary importance in determining the extent of the shelf. While the shelf must be adjacent to the coast, absolute proximity is not a factor in determining the extent of the jurisdiction over the shelf. In light of the North Sea Case, the 200 meter test must be considered as holding that a coastal state's jurisdiction over the shelf extends to a depth of 200 meters, and as far beyond that as it can be shown that the shelf is a natural prolongation of the land. (Caldwell-Florida)
W70-08805

INTERNATIONAL PRACTICE REGARDING TRADITIONAL FISHING PRIVILEGES OF FOREIGN FISHERMEN IN ZONES OF EXTENDED MARITIME JURISDICTION,
David W. Windley.
American Journal of International Law, Vol 63, 1969, p 49-503. 51 ref.

Descriptors: *International law, *Law of the sea, *Foreign waters, *Commercial fishing, International waters, Legal aspects, Continental shelf, Oceans, Aquatic life, Marine fisheries, Legislation, Atlantic Ocean, Treaties, Trawling, Fisheries Regulation, Crabs, Tariff, Jurisdiction, Political aspects, Fishing, Fish, Relative rights.
Identifiers: *Comity.

In recent years many nations have for various purposes extended their sovereignty or exclusive control beyond the three mile territorial sea traditionally claimed. Often the purpose is to preserve exclusive fishing rights for the coastal state or to regulate the activities of foreign fishermen. The displaced fishermen have no privilege beyond what international comity can preserve for them. Thus, at times, coastal nations recognize each other's traditional or historic fishing rights on a basis of reciprocity. In other cases governments do not recognize historic rights but, nevertheless, agree to fish in each other's coastal water pursuant to mutually acceptable provisions. The United States maintains exclusive fishing rights in a nine mile zone contiguous to its three mile territorial sea. However, it recognizes traditional fishing rights in the contiguous zone. The United States has made agreements with Russia, Japan and Mexico controlling traditional fishing rights and exploitation of the continental shelf. Some South American nations, to control foreign fishing, claim sole sovereignty over waters up to 200 miles from their coast. Also discussed are other agreements on fishing rights. They involve such countries as Russia, Iceland, Japan, South Africa, Australia and New Zealand. (Hubener-Florida)

INTERNATIONAL LAW AND 'THE INTERESTS': THE LAW OF THE SEABED,
Louis Henkin.
American Journal of International Law, Vol 63, 1969, p 504-510. 11 ref.

Descriptors: *Appropriation, *International law, *Jurisdiction, *Ownership of beds, Boundaries (Property), Beds under water, Boundary disputes, Equitable apportionment, Federal government, Federal jurisdiction, Governments, Legal aspects, Legislation, Political aspects, Submerged Lands Act, Treaties, International waters, Foreign waters, Oil industry, Preferences (Water rights), Priorities, Oceans, Continental shelf, Continental slope.
Identifiers: *Mineral rights.

One of the least settled areas of international law concerns coastal nations' rights to the seabed. The basic legal issues are simply stated: how far do, and should, the exclusive rights of coastal states extend, and what legal regime should govern exploitation beyond the limits of national jurisdiction. The United States has been the first to consider these questions, but it has reached no concrete conclusions. Different interests have pressed for different official positions. The National Petroleum Council advocated a position that the legal continental shelf should extend to the full limit of the continental

nd mass. If all coastal nations adopted this policy, ıe quarter of the total ocean bed would be ap-ropriated. The International Law Commission and e International Court of Justice would severely nit coastal boundaries. One major concern is that e accepted extension of national jurisdiction for ıe purpose tends to become jurisdiction for all rposes. A presidential commission has recently roposed an 'intermediate zone' in which the astal state would have the exclusive right to ex-oit the resources, subject to the regime that is to vern all the seabed beyond national jurisdiction. entifiers: *Outer Continental Shelf Lands Act.

efendants wished to commercially develop as urist attractions two reefs located 4 1/2 miles outheast of Florida. Plaintiff United States notified efendants: (1) that they were precluded from un-rtaking any construction in the navigable waters the United States without the approval of the epartment of the Army; (2) that the Depart-ent's authority extended to fixed structures cated upon the Outer Continental Shelf; and (3) at the reefs were located within the Outer Con-ental Shelf. Nevertheless, defendants began con-ruction. Plaintiff brought suit for trespass on overnment property and for violation of section 0 of the Rivers and Harbors Act of 1899 and sec-on 4 (f) of the Outer Continental Shelf Lands Act f 1953, both of which required authorization of ıe Department of the Army before artificial struc-ures could be erected on the outer continental elf. The court held that the United States did not old title to the continental shelf, only jurisdiction f the seabed. Consequently, there was no trespass, ut defendants clearly violated the statutes since ıe reefs were found to be part of the seabed rather an islands. (Clarke-Florida)

dentifiers: *Seabeds.

n United States v Louisiana, 394 U. S. 11 (1969), decree was sought to determine the line marking he seaward limit of the inland waters of Louisiana. The United States contended that the Submerged ands Act of 1953 had given to Louisiana, by quit claim deed from the United States, lands extending three miles from the state's coastline into the Gulf of Mexico. Louisiana contended that this Act did not apply to it since the boundaries of its inland waters had already been delineated by the Submerged Lands Act of 1895 and since the inland water line so delineated was a historic boundary. The Supreme Court distinguished the two Acts in that the 1895 Act was concerned with navigational waters, whereas the 1953 Act pertained to boundary matters. As to Louisiana's claim to the historic boundaries, the Court held that historic title can be claimed only when the coastal nation has traditionally asserted and maintained dominion with the acquiescence of foreign nations. In connection with this case, the Court further held that: (1) dredged channels do not constitute inland waters; (2) low tide elevations are part of the coastline; (3) a bay must be at least a semi-circle, and islands can be included as part thereof; and (4) islands realistically part of the coast can be headlands to a bay. REFLECTIONS ON RIPARIANISM,
T. E. Lauer.
Missouri Law Review, Vol 35, 1970, p 1-25.

Descriptors: *Social aspects, *Riparian rights, *Competing uses, *Watercourses (Legal), Civil law, Industries, Judicial decisions, Legal aspects, Natural flow doctrine, Prior appropriation, Water tights, Relative rights, Municipal water, Reasonable use, Obstruction to flow, Water pollution, Water utilization, Water resources development, Governments, Water resources, Permits, Regulation, economics, Resource allocation, Legislation.

'Reflections on Riparianism' suggests possible legal solutions to the rapidly deteriorating water situation in the United States. It discusses in detail the legal technicalities of riparianism, its virtues and its drawbacks, and it explores alternatives to the riparian system including prior appropriation, the permit system, economic determinism, quantifying the water right, water development and a modified riparian system. The author concludes that an updated and modernized riparian system would be the best legal means for pre-serving and equitably distributing present and future water resources. (Clarke-Florida)

TERRITORIAL SEAS - 3000 YEAR OLD QUESTION.
Journal of Air Law and Commerce, Vol 36, 1970, p 73-104.

Descriptors: *International law, *International waters, *Law of the sea, *Jurisdiction, Oceans, Admiralty, International commissions, Navigation, Legal aspects, Relative rights, Foreign waters, Treaties, Ships, History, United Nations, Bays, Inland waterways, Water rights, Political aspects, Governments, Prescriptive rights, Judicial decisions, Commercial fishing.

Territorial waters, as opposed to international or inland waters, have long been a source of friction in international relations. Historically, the right of all nations to the high seas has been recognized. Several rules concerning jurisdiction over territorial seas have developed, the most common being the three mile 'cannon shot' rule. Difficulties in drawing the 'base line' for the delimitation of the territorial sea arise where states have rough, deeply indented coastlines, and in cases of islands or large bays or gulfs. The extent of jurisdiction over territorial waters has been historically conceived of as actual ownership, subject to the right to innocent passage of foreign vessels. Presently, the plethora of limits claimed by various nations causes much international dispute. Most nations claim three mile limits, but some claim four, twelve, and even two-hundred miles. Several international conferences have failed to solve the problem. Much legal and political turmoil could be avoided by an international agreement on some standard, such as a six mile limit with a six mile contiquous zone where the coastal state would have exclusive fishing and exploitation rights. (Caldwell-Florida)

THE CONSTITUTIONAL SANCTITY OF A PROPERTY INTEREST IN A RIPARIAN RIGHT.
Washington University Law Quarterly, Vol 1969, p 327-338.

Descriptors: *Riparian rights, *Permits, *Regulation, *Administrative agencies, Compensation, Prior appropriation, Control, Legal aspects, Legislation, Competing uses, Water utilization, Reasonable use, Water allocation (Policy), Water rights, Administration, Economics, Non-structural alternatives, Public benefits, Public rights, Usufructuary right, Water users.

As a water supply sufficiently abundant for all needs has disappeared in the Eastern United States, the justifications for the traditional riparian doctrine have also decreased. State legislation has been widely proposed to meet the increasing need for administrative supervision of all future water allocation. Much proposed legislation, based on the Model Water Use Act, changes the riparian system by the creation of a permit system. Existing uses of water would be allowed to continue, but future uses could only be instituted by obtaining a permit. Broad discretion would be accorded agencies in establishing priorities in the issuance of permits. The permits should be of a fixed duration sufficient to provide investment security. The agency would have power to issue a permit for water use without regard to common law restrictions on the riparian's use. Modifications of riparian uses in the nature of regulations should be permitted under the police power with no compensation required. If the modification amounted to a taking of property, compensation would be required to satisfy due process. The historical test, however, has required compensation for any diminution of value of a property right caused by government regulations. (Hubener-Florida)

NARAMORE V STATE (DAMAGES FOR NEGLIGENT OPERATION OF BARGE CANAL).
285 NY 80, 32 NE2d 800-802 (1941).

Descriptors: *New York, *Dams, *Damages, *New York State Barge Canal, Canals, Channels, Engineering structures, Ice, Melting, Sluices, Structures, Regulation, Surface waters, Damsites, Mill dams, Barriers, Judicial decisions, Legal aspects, State governments, Discharge (Water), Open channels.

Plaintiff land owner brought action against defendant state for damages allegedly arising from the negligent operation of a barge canal. Defendant had opened the sluice gates at two points on the canal and thereby raised the level of water in a creek which flowed across plaintiff's land. Plaintiff had constructed a dam on the creek for the operation of a flour mill. Ice had formed on the water in

the creek and around the abutments of the dam. Plaintiff claimed that the higher water level raised the ice against the dam, thereby causing it to topple over. Defendant claimed plaintiff was negligent in not cutting a channel in the ice as had been done in previous years, and that plaintiff had been on notice of the impending water release. The Court of Appeals of New York ruled that plaintiff could not have known the release would happen so early in the year and that the need for the channel only arose when a thaw threatened to raise the water level. The judgment of the trial court for the plaintiff was reinstated. (Barker-Florida)
W70-08822

PEOPLE V MCDONNELL (PROTECTION OF PUBLIC RIGHTS IN CANAL).
262 Ill 114, 199 NE 93-96 (1935).

Descriptors: *Illinois, *Navigable waters, *Canals, *Public rights, Inland waterways, Ownership of beds, Navigation, Transportation, Real property, Land use, Jurisdiction, State governments, Federal government, Legislation, Water pollution, Waste disposal, Developed waters, Watercourses (Legal), Judicial decisions, Legal aspects.

Plaintiff citizens, through the state attorney general, sought to enjoin defendant's encroachment upon the bed of a canal and his disposal of garbage and other refuse into the canal. Defendant claimed title to a tract of land along the canal. Defendant also asserted that: (1) little water remained in the canal; (2) the canal was filled in, in many places; and (3) the state had abandoned the canal by not using it for 35 years. Plaintiffs contended that defendant's activities were a public nuisance and constituted an encroachment upon state property. The court, in holding for plaintiffs, found that the canal had been constructed by the state under the authority of the federal government and was a navigable body of water. Although the canal was an artificial waterway which was at present unnavigable, the state retained the power to preserve the canal for future transportation. No federal or state act had been passed expressly abandoning the canal. The canal could not lose its status as a navigable waterbody without an express act of Congress. The state, by statute, was empowered to protect public rights in the canal. (Hubener-Florida)

BOSTON AND A RR V COMMONWEALTH (CONTRACT FOR LAND TO CREATE A RESERVOIR).
6 NE2d 613-618 (Mass 1937).

Descriptors: *Massachusetts, *Administrative agencies, *Claims (Contracts), *Supervisory control (Power), Reservoirs, Contracts, Water supply, Reservoir storage, River basin development, Railroads, Water districts, Flooding, Submergence, Dam construction, Damstes, Municipal water, Land tenure, Land use, State governments, Administrative costs, Administrative decisions, Judicial decisions, Legislation, Legal aspects.

Plaintiff railroad brought action against the Commonwealth of Massachusetts to recover damages from an alleged breach of contract. Plaintiff contracted with the Metropolitan District Water Supply Commission, which purported to act for the Commonwealth, for the abandonment of plaintiff's railroad running through the Swift River Valley, wherein a storage reservoir was to be created. The property of the plaintiff railroad was included in the area to be flooded by the reservoir and upon which a dam was to be erected. Plaintiff removed all railroad appurtenances, did all things required of it under the contract, and delivered a deed conveying the land to the Commission. The Commonwealth, however, declined to remit the amount specified in the contract. It contended that the Commission was not authorized by statute to make any such binding contract without the approval of the Governor and Council, which approval was not obtained. The court, interpreting the applicable statutes, held that the Commission had sufficient authority to make contracts for the securing of additional water supply for the metropolitan water system and could bind the Commonwealth even without approval by the Governor and Council. INSTITUTIONS FOR EFFECTIVE MANAGEMENT OF THE ENVIRONMENT.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

Washington, D.C., National Academy of Sciences - National Academy of Engineering, January 1970. 62 p.

Descriptors: *Environment, *Institutions, *Management, Environmental effects, Institutional constraints, Organizations, Administration, Planning.
Identifiers: *Environmental policy.

It is concluded that present institutional arrangements for effective environmental management are inadequate. A much greater emphasis on environmental monitoring is essential, as is the development of an Environmental Quality Index as a management tool, the establishment of a Board of Environmental Affairs within the Office of the President and a National Laboratory for Environmental Science. There is a need for continuing systematic analysis in support of efforts to deal with the environment and the national policies affecting the environment, and a new Institute for Environmental studies has been proposed to meet this need. Theoretical and experimental investigations of the seismic effects of underwater explosions of dynamite charges are described. Acoustic efficien

was determined in a broad frequency band. In e seismic frequency band, the partition of energy tween the shock wave and bubble pulses, the ismic effects of cavitation due to ghost reflection the air-water interface, and the damage caused marine life were determined. The seismic effi- ency of charges of the order of 100 gm can be nsiderably increased by dividing the charges and shooting at depth. Two or three properly spaced gm charges of dynamite, shot at a depth of about m, give the same result as a single charge of out 5 to 15 kg shot at a depth of 1 m. Marine sec- ons comparing caged charge shooting with con- ntional shooting in the same area are shown. (K- pp-USGS)

escriptors: *Aerial photography, *Water sources development, *Glacial drift, *Terrain alysis, Geomorphology, Photogrammetry, Sur- eys, Mapping, Glaciation.
entifiers: Aerial photography interpretation.

haracteristics of landscape indicators of ground- aters are described for photointerpretation. Four acial types of landscape, including hilly-moraine, rumlin, morainic plain and terminal-moraine; ree water-glacial types of landscape, including ame (and os), lake-glacial plain and outwash ain; the karst erosion type of landscape; and eashores are described. Interpretation of water-re- ted features of these types of terrain on aerial notographs is discussed. (Knapp-USGS)

NSTRUMENTATION AND OBSERVATION ECHNIQUES.

roceedings of Canadian Hydrology Symposium o 7, Victoria, British Columbia, scheduled for lay 14-15, 1969; held Oct 8-9, 1969, National esearch Council of Canada, Subcommittee on ydrology, 2 Vol, 1969. 343 p.

escriptors: *Conferences, *Instrumentation, Remote sensing, *Hydrologic data, Mapping, ata collections, Surveys, Water levels, Meteorolo- y, Water resources, Hydrogeology, Geophysics, elemetry, Data processing, Data transmission, ata storage and retrieval, Soil moisture, Ground- ater, Surface waters, Climatology.
dentifiers: Canada.

he primary purpose of the Seventh Canadian ydrology Symposium was to provide Canadian ydrologists with a reference work of not only raditional instruments and techniques but also a eference relative to those instruments and echniques now in the experimental and develop- ent stage. A second objective, as in previous sym- osia, was to stimulate an information exchange nd in this regard most of the program time was al- oted to discussion. The program included 15 original papers allocated to two sessions. The first session was devoted to instrumentation with emphasis on meteorological, soil moisture, ground- water, surface water, sedimentation and water quality instruments, and the second session con- centrated on new techniques. Included in this latter category was a paper on tracers and two panels with papers related to automatic stations and remote sensing techniques. (Knapp-USGS)

REVIEW HYDROMETEOROLOGICAL IN- STRUMENTATION,
Department of Transport, Toronto (Ontario). Meteorological Branch.
D. J. McKay.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 1-20, Vol 1, 1969. 20 p, 17 ref.

Descriptors: *Instrumentation, *Data collections, *Hydrologic data, Precipitation gages, Rain gages, Precipitation (Atmospheric), Telemetry, Snow sur- veys, Nuclear moisture meters, Air temperature, Winds, Solar radiation, Sampling, Humidity, Data processing.
Identifiers: Hydrometerological instrumentation, Canada.

Instrumentation designed to measure precipitation, temperature, and evaporation, are thoroughly reviewed and other meteorological instruments required in Canadian hydrological research and operations are discussed. Precipitation gages mea- sure rain or snow, or both liquid and solid precipitation. These instruments range from stan- dard basic equipment to sophisticated long-dura- tion recording devices with analog, digital, or telemetry output. Precipitation gages shields are described and the section on snow gages includes a discussion of snow samplers, snow pillows and radioactive measuring techniques. Evaporation in- strumentation includes pans, atmometers, and lysimeters. Measurements of meteorological parameters used in evaporation equations, such as air and water temperatures, wind, humidity and solar radiation are described. (Knapp-USGS)

Descriptors: *Telemetry, *Data collections, *Data transmission, *Hydrologic data, Tides, Water level fluctuations, Water levels, Navigation, Data processing, Data storage and retrieval, Logging (Recording).
Identifiers: Canada.

Several automatic tide and water level recording systems for observations over long periods, for telemetry using permanently rented telephone lines, for interrogation by a simple telephone call and by radio carrier technique, used for several years by the Tides and Water Levels Section of the Department of Energy, Mines and Resources, Canada, are described. In the Canadian Arctic, or in areas with long-sloping foreshores, or for water level measurements at the continental shelf, pres- sureoperated devices were developed, utilizing as much as possible, commercially available com- ponents. Automatic analogue recording devices were modified to make the data output compatible for computer usage. Digital recorders are being in- stalled on a trial basis at tide and water level sta- tions to improve the data gathering and processing procedures. (Knapp-USGS)

Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 295-309, Vol 1, 1969. 15 p, 6 fig, 9 ref.

Descriptors: *Remote sensing, *Infrared radiation, *Radar, Temperature, Instrumentation, Water temperature, Spectroscopy, Mapping.
Identifiers: Microwave radiometry, Canada.

The Airborne Radiation Thermometer provides a fast, relatively accurate and operationally-proven technique for measuring surface water tempera- tures of large bodies of water. The basic theory of the infrared bolometer, some of the instrumenta- tion currently available, operational problems and their solutions and a method for correcting for the environmental error introduced by the atmosphere are discussed. A test and evaluation study of a rela- tively inexpensive analog system is reviewed and followed by a description of highly successful operational surveys which are still being con- ducted. A more sophisticated, and more expensive, infra-red scanner which provides detailed imagery of the surface water temperature patterns and newer microwave techniques are also reviewed and their relative merits discussed. TRACER TECHNIQUES IN HYDROLOGY,
Guelph Univ. (Ontario). Dept. of Soil Science.
D. E. Elrick, and D. W. Lawson.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for

May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 155-187, Vol 1, 1969. 33 p, 1 fig, 2 tab, 119 ref.

Descriptors: *Tracers, *Tracking techniques, *Hydrogeology, Groundwater movement, Soil water movement, Sediments, Sediment transport, Precipitation (Atmospheric), Streamflow, Radioactivity techniques, Dye releases, Dispersion, Mixing, Diffusion, Porous media, Surface waters, Groundwater, Soil water, Instrumentation.
Identifiers: Canada.

Knowledge of water movement in many areas of the hydrological cycle can be aided by the use of tracer techniques. The present state of tracer technology, both radioactive and non-radioactive is reviewed and applications to the transport of water in the atmosphere throughout all areas of the hydrological cycle are discussed. The prerequisites of a good tracer in the atmosphere, soil, rivers, or groundwater are described and the performance of tracers such as tritium, colored dyes, and others is discussed with reference to particular applications. Measurement techniques are emphasized. (Knapp-USGS)

PROJECT CALORIC - AN INVESTIGATION OF HEAT RELEASE PATTERNS ASSOCIATED WITH PRESENT AND PLANNED ELECTRIC POWER PLANTS ON CAYUGA LAKE (Experimental Program),
Cornell Aeronautical Lab., Inc., Buffalo, N.Y.
G. Neumaier, and D. Bock.
Cornell Aeronautical Laboratory, Inc., Final report, Nov., 1969. 61 p, 30 fig, 2 tab, 5 ref.

Descriptors: *Isotherms, *Thermocline, *Data collections, *On-site data collection, *Infrared radiation, *Remote sensing, Electric power plants, Nuclear power plants, Instrumentation, Bouyoucos blocks, Thermometer, Current meter, Digital computer, Telemetry, Computer program.

Experimental results are presented of the 12-month investigation of the heat release patterns associated with the present and planned electric power plants of Cayuga Lake. A detailed description is given of the measuring instrumentation and techniques that were used to obtain the data. The information is presented in two sections: The first, 'Aerial Infrared Measurements, describes the aerial measurement effort and presents the plots of isotherms in the lake. The second 'In-Lake Measurements,' describes the design and utilization of the in-lake instrumentation and presents typical examples of the lake data. (Osborne-Vanderbilt)

AUTOMATIC MASS SPECTROMETRIC ANALYSIS OF THE DEUTERIUM TO HYDROGEN RATIO IN NATURAL WATER,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Chemistry and Materials Div.
W. M. Thurston.
The Review of Scientific Instruments, Vol 41, No 7, p 963-966, July 1970. 6 fig, 5 ref

Descriptors: *Deuterium, *Spectrometers, *Chemical analysis, *Automation, Instrumentation, Water analysis, Stable isotopes, Sampling, Analytical techniques.
Identifiers: *Automatic mass spectrometry, *Mass spectrometers.

A sampling concept to convert liquid water to vapor, without changes in the deuterium to hydrogen ratio, makes possible the construction of an automated mass spectrometer system for determining the deuterium to hydrogen ratio of water samples. The automatic cycle uses an increasing pressure approach to mass spectrometer dosing with excellent suppression of memory effects. Mass-2 ion abundance is used as the pressure sensor to actuate the single control valve in the automatic cycle, coupled with digital readout of the mass-3 ion abundance. A precision of 0.1 ppm at the natural concentration level is achieved with a cycle time of 2 min. The automatic cycle may be applied to on-stream gaseous hydrogen analysis with a precision of 0.1 ppm and a 50 sec cycle time. (Knapp-USGS)

A THREE COMPONENT DRAG PROBE FOR THE MEASUREMENT OF TURBULENT WATER VELOCITY FLUCTUATIONS,
Oregon State Univ., Corvallis. Dept. of Oceanography.
Marshall D. Earle, Jack H. Groelle, and George F. Beardsley, Jr.
The Review of Scientific Instruments, Vol 41, No 7, p 1021-1025, July 1970. 6 fig, 11 ref. Grant GA 998 (NSF).

Descriptors: *Turbulence, *Flowmeters, *Turbulent flow, Velocity, Current meters, Flow, Open channel flow, Instrumentation, Friction, Frequency, Fluid friction.
Identifiers: Turbulence meters, Drag probes.

Two spherical drag probes which use variable inductance devices as displacement transducers were built to measure turbulent water velocity fluctuations. The associated circuitry provides voltage outputs which are proportional to the three components of force acting on the spherical sensor of each probe. The probes respond to the fluid drag force and also to the fluid inertial force in an accelerating flow field. The frequency at which the response is 3dB down is 18 Hz for one probe and 41 Hz for the other. The instruments have been calibrated for oscillating flows with velocities from 10 to 150 cm/sec. Guelph Univ. (Ontario).
Stanley H. Collins.
Proceedings of Canadian Hydrology Symposium No 7, Victoria, British Columbia, scheduled for May 14-15, 1969; held Oct 8-9, 1969, National Research Council of Canada, Subcommittee on Hydrology, p 283-294, Vol 1, 1969. 12 p, 1 fig, 1 ref.

Descriptors: *Aerial photography, *Remote sensing, *Hydrologic data, *Mapping, Data storage and retrieval, Photogrammetry, Water resources development, Rainfall-runoff relationships, Snow surveys, Infiltration, Water yield, Runoff, Streamflow, Flood damage, Evapotranspiration, Precipitation (Atmospheric).
Identifiers: Canada.

The uses of aerial photography in hydrology are reviewed briefly. Photography is discussed in its relationships with other remote sensing techniques and the reasons are given why the photographic techniques of recording, storage and mapping are valuable and why their uses are multiplying. An account is given of the development of new photographic mapping techniques, including a description of the production and properties of orthophotos. Brief mention is made of the new stereorthophotos and their advantages for resource development planning. (Knapp-USGS)

08. ENGINEERING WORKS

8A. Structures

GATES AND RELATED OPERATING EQUIPMENT,
International Power and Engineering Consultants Ltd., Vancouver (British Columbia).
N. H. Latimer, and J. Pocher.
Engineering Journal-Canada, Vol 52, No 10, p 99-108, Oct 1969. 10 p, 10 fig, 4 ref.

Descriptors: *Hydraulic gates, Gate hoists, Intake gates, *Fixed wheel gates, Design, *Radial gates, Spillway gates, Corrosion, Paints, Foreign design practices, Corrosion control, Painting, Protective coatings, Gate seals, *Slide gates, *Handling equipment, Design criteria, Model tests, Hydraulic systems.
Identifiers: Peace River Proj (Canada), Canada, Portage Mountain Dam (Canada).

The design and operating characteristics of the gates and gate operating equipment used on the Portage Mountain Development in Canada are reviewed. The gates described include 13 ft-0 in. wide by 19 ft-6 in. high fixed-wheel intake gates designed for 265-ft head and operated by submerged linear hydraulic actuators, 15 ft-0 in. wide by 32 ft-10 in. high horizontally split draft tube gates, 50 ft-0 in. wide by 62 ft-0 in. high spillway radial gates, and 6 ft-0 in. wide by 8 ft-0 in. high free-discharge spillway slide gates. Material selection and design details of some important elements are outlined and operating experiences are reported on gates in service. Some conclusions are (1) protection against corrosion is important

gate design; (2) weight of paint should be taken nto account when determining hoisting effort, especially for large radial gates such as those used on the Portage Mountain Development where the weight of paint on each gate approached 10,000 lb; and (3) problems and innovations in gate construction should be reported in literature to aid designers. SEMI-CIRCULAR STOPLOGS,
International Power and Engineering Consultants Ltd, Vancouver (British Columbia).
J. J. Sled, and N. Purssell.
Engineering Journal - Canada, Vol 52, No 10, p. 17-124, Oct 1969. 8 p, 8 fig, 3 ref.

Descriptors: *Stop logs, Hydraulic gates, *Handling equipment, Cranes, Design, Construction, Diversion tunnels, Operation and maintenance, Cold weather construction, Model tests, Spillway gates, Installation, Foreign projects, Freezing, *Semicircular sections, River closures, Diversion.
Identifiers: *Closures, *Lifting devices, Peace River Proj, Can; Canada, Icing, Low temperature.

A description is given of the design, construction, and operation of 53-ft-dia semicircular stoplogs used for closing the 48-ft-dia diversion tunnels at the W A C Bennett Dam, Peace River Project, Canada. Handling equipmetnt consists of a specially designed lifting beam capable of automatically engaging and releasing the stoplogs, and a gantry crane for picking up stoplogs from a storage area and placing them in the entrance of any one of the 3 diversion tunnels. Handling equipment and stoplogs are designed for placing during low temperature conditions and at flows of 45,000 cfs through the tunnel that is being closed. The stoplogs are designed for a static head of 141 ft. Semicircular stoplogs were developed and have been used extensively in Sweden, but this use is believed to be the first on a major project in North America. Following completion of the final tunnel plug, the stoplogs and gantry crane were moved to the spillway area where the same system will provide upstream closure of the spillway channel and permit maintenance of the spillway radial control gates. STILLING BASINS WITH WEDGE-SHAPED BAFFLE BLOCKS,
N. Narayana Pillai.
Water and Water Engineering, Vol 73, No 886, p 506-509, Dec 1969. 4 p, 7 fig, 5 ref.

Descriptors: *Stilling basins, Energy dissipation, *Baffles, Hydraulic models, Scour, Shape, Wedges, Hydraulics, Model studies, Hydraulic jump, Froude number, Cavitation, Foreign research.
Identifiers: *Chute blocks, *Baffle piers, Bureau of Reclamation, Bed profiles, India.

Hydraulic model studies were conducted in India to determine the suitability of wedge-shaped baffle blocks in stilling basins. Performance of the wedge-shaped baffle blocks was compared with that of rectangular baffle blocks used by the Bureau of Reclamation in the study of its Stilling Basin III model. The wedge-shaped baffle blocks can be placed farther up the jump than rectangular blocks, increasing the drag and energy dissipation considerably. Stilling basins using the wedge-shaped blocks can be developed to operate efficiently and are shorter in length. Because of the super-cavitating shape of the baffle blocks, susceptibility to cavitation is less. More detailed experiments are necessary to finalize the dimensions of the basins. (USBR)
W70-08676

LOW LEVEL OUTLETS,
International Power and Engineering Consultants Ltd., Vancouver (British Columbia).
W. C. Goines, and E. A. Portfors.
Engineering Journal-Canada, Vol 52, No 10, p 71-75, Oct 1969. 5 p, 6 fig, 2 ref.

Descriptors: Outlets, *Outlet works, Valves, Foreign design practices, Foreign construction, *Energy dissipation, *High pressure valves, *Model tests, *High pressure gates, Hydraulic models, Model studies, Hydraulic design, Performance, Hydraulic gates and valves, Steel linings.
Identifiers: Outlet tunnels, *Hollow cone valves, Deflectors, Canada, Valve vibration, Energy dissipators, W A C Bennett Dam, Canada.

The design and operation of the low level outlets at W A C Bennett Dam in Canada are described. The outlets consist of twin 84-in.-dia hollow cone valves installed in the concrete plugs in 2 of the 3 diversion tunnels. Each hollow cone valve is backed up by two 84-in. ring follower gates designed to close under maximum head and full discharge. Hollow cone valves were selected for the outlets because of the design requirement for high energy dissipation within a relatively short portion of the tunnels for a wide range of flow conditions. The energy dissipation chambers immediately downstream from the concrete plugs consist of 43-ft-dia circular barrel sections incorporating deflector rings that project 4.5 ft inward from the barrel walls. The chambers are steel lined around the full circumference for a distance of 63 ft downstream from the plug and around the lower half for an additional 71 ft. Hydraulic model studies for determining the energy dissipation capability are described and results given. Hydroelastic model tests were run to ascertain response of the hollow cone valve components to flow-induced vibrations. (USBR)
W70-08677

SPILLWAY--PART I AND PART II,
Western Canada Hydraulic Labs. Ltd; and International Power and Engineering Consultants Ltd., Vancouver (British Columbia).
J. W. Ball, P. E. Fawkes, and R. E. Johnson.
Engineering Journal-Canada, Vol 52, No 10, p 76-87, Oct 1969. 12 p, 15 fig, 3 ref, append.

Descriptors: Flood routing, *Spillways, Radial gates, Sluices, Foreign design practices, *Flip buckets, *Model tests, Model studies, *Hydraulic models, Chutes, Transitions (Structures), Hydraulic structures, Pressure distribution, Energy dissipation, Control structures, Groins, Tailwater, Scour, Surges.
Identifiers: *Ski-jump spillways, Spillway piers, Ogee crests, Canada, Chute spillways, Approach channels, W A C Bennett Dam, Canada.

The spillway at W A C Bennett Dam in Canada is one of the largest ski-jump-type spillways in the world. The spillway has a drop of 550 ft and is designed for a maximum discharge of 341,000 cfs. Main elements of the spillway are: an approach channel, three 50-ft-wide ogee sections containing 9 sluices and controlled by three 62-ft-high radial gates, a transition section, a discharge channel, and a steep chute that terminates in a flip bucket. Two papers describe tests of 2 hydraulic models. The inlet model was at a 1:84 scale and included a portion of the dam and reservoir, the approach channel, control structure, transition, and discharge channel. The outfall model was at a 1:96 scale and included the discharge channel, chute, flip bucket, and river tailrace area. Modifications to the approach channel, piers, and transition section resulting directly from the inlet model tests are described. Out-fall model tests resulted in a lower elevation, an increase in the lip angle, and an asymmetrical bowl-shape for the flip bucket. (USBR)
W70-08683

8C. Hydraulic Machinery

PEACE TRANSMISSION LINES, 500KV--DESIGN AND CONSTRUCTION,
International Power and Engineering Consultants Ltd., Vancouver (British Columbia).
J. C. Stevens, and W. P. Johnson.
Engineering Journal-Canada, Vol 52, No 10, p 131-135, Oct 1969. 5 p, 2 fig, 2 tab, 2 ref.

Descriptors: *Transmission lines, *Extra high voltage, Dampers, *Extra long distance, Transmission towers, Guyed towers, Construction, Spacers, Electrical design, Electric insulation, Clearances, Construction costs, Helicopters, Bundled conductors, Electrical insulators, Foreign construction.
Identifiers: *Peace River Proj (Canada), Grille footings, Transmission line hardware, Electric conductors, Suspension insulators, Canada.

Design and construction features of the two 500-kv transmission lines from the Peace River Project in northeastern British Columbia are described. The 2 ehv lines will be capable of carrying the ultimate output of the Gordon M Shrum Generating Station to Southern Canadian power centers. The 576-mile line was energized at 500-kv during 1968. The 548-mile line was put into service as far as Kelly Lake Substation in 1969, with the remaining section under construction. Line parameters, tower and foundation design, conductor hardware, conductors, insulation and clearances, and construction are discussed. The use of guyed towers resulted in appreciable savings compared to all-rigid tower construction. Many miles of the line have been completed for 2 or 3 winters, and the service record is excellent. (USBR)
W70-08672

DC CIRCUITRY IN POWER SYSTEMS PROTECTION,
Northeast Utilities Service Co., Wethersfield, Conn.
T. U. Patel, and N. M. Reid.

Transmission and Distribution, Vol 22, No 4, p 60-63, Apr 1970. 4 p, 3 fig.

Descriptors: *Power system operations, *Reliability, Direct current, *Electric relays, *Faults (Electrical), Supervisory control (Power), Batteries, Fuses (Electrical), Power operation and maintenance, Electric wires, Electrolysis.
Identifiers: *Protection (Electrical), Electric conductors, Power system stability.

Power system protection requires reliability, high speed, stability, and sensitivity. To achieve this, equipment associated with protective schemes must function correctly. Direct-current circuitry performs a major function of the scheme, and care must be exercised in the design, selection, and maintenance of the protective equipment. The protective equipment may be used to isolate a fault only once, so there should be no risk of failure of the d-c circuitry. (USBR)

THE COLUMBIA RIVER DEVELOPMENT--A GEOTECHNICAL REVIEW,
British Columbia Hydro and Power Authority, Vancouver; and Thurber (R. C.) and Associates Ltd., Victoria (British Columbia).
R. C. McMordie, and G. C. Morgan.
Engineering Journal: Canada, Vol 53, No 2, p 9-17, 30, Feb 1970. 10 p, 11 fig, 1 tab, 8 ref, disc.

Descriptors: *Earth dams, *Dam design, *Dam construction, Differential settlement, Dam foundations, Dams, Foreign construction, Cracking, Zoned embankments, Foreign design practices, Dewatering, Cutoff trenches, Soil liquefaction, Underseepage, Underwater construction, Cutoff walls, Impervious blankets, Settlement (Structural), Flexible foundations.
Identifiers: *Columbia River Development, Canada, Dam stability, Canada, Seepage control, Slurry trenches, Embankment subsidence.

The current phase of the Columbia River Development in British Columbia consists of constructing 3 earthfill dams: Duncan, Hugh Keenleyside, and Mica. Some problems in design and construction of the dams and steps taken to cope with the problems are discussed. Problems at Duncan Dam were high foundation seepage and settlement and the possibility of foundation liquefaction. Hugh Keenleyside Dam has a deep, pervious foundation, and the site posed difficult dewatering problems. Problems at Mica Dam stemmed mainly from lack of precedent, particularly the behavior of earth and rockfill materials under high pressures. Control of embankment cracking was an important consideration for all 3 dams. Problems at Duncan were overcome by a reservoir blanket, a partial cut-off constructed by the slurry trench method, relief wells, flat embankment slopes, and control of the rate of embankment construction. At Hugh Keenleyside, a reservoir blanket was used to control seepage, and the need for dewatering was eliminated by constructing that portion of the dam below normal low water by controlled dumping of fill in the river. The approach used to overcome embankment cracking problems was to limit deformation of the fill as much as practicable and to provide in the design for development of cracks. (USBR)

YIELDABLE ROCK BOLTS FOR SHOCK LOADING AND GROUTED BOLTS FOR FASTER ROCK STABILIZATION,
East Rand Proprietary Mines Ltd., Boksburg (South Africa); and Colorado School of Mines, Golden.
W. D. Ortlepp, and John J. Reed.
Mines Magazine, Vol 60, No 3, p 12-17, Mar 1970. 5 p, 8 fig, 5 ref.

Descriptors: *Rock bolts, *Rock mechanics, *Rock excavation, Grouting, Tunnel design, Stabilization, Tunnels, Roof bolts, Tunneling, Foreign design practices, Underground structures.
Identifiers: *Rockbursts, Tunnel supports, Rock dilation, Underground openings, Yielding, South Africa, Rock pressures, Stress waves.

Yieldable rock bolts are effective in reinforcing underground openings against shock loading; fully grouted rock bolts have been very effective for reinforcement against static loading, especially when immediately installed and grouted. Analysis of support requirements shows that the inherent strength of a fractured rock wall tends to provide stability if the fractured rock is held in position and kept intact, even with relatively large displacements in the fractured shell. Design requirements for rock bolts are simple: the support must act quickly and maintain the restraining effect while yielding through appreciable displacements. Rock bolts are capable of supplying the early restraint, but have a limited yield capacity and may fail abruptly at high strain velocities. A yieldable rock bolt was developed and tested for resistance to blasting loads of the same order of magnitude experienced during rock bursts. Results indicate that a tunnel supported by yieldable rock bolts could survive all but the most violent rock bursts. An analysis comparing grouted with ungrouted rock bolts indicates a fully grouted rock bolt installed immediately after rock excavation, even though initially untensioned, should be several times more effective than a tensioned but ungrouted rock bolt. (USBR)

Descriptors: *Subsidence, *Withdrawal, *Aquifers, *California, Water levels, Compaction, Geology, Soil mechanics, Hydrograph analysis, Observation wells, Water utilization.
Identifiers: San Joaquin Valley (Calif), Tiltmeters.

Two continuous-recording liquid-level tiltmeters and three associated borehole extensometers recorded tilt at land surface and compaction in the upper 150 feet of alluvial-fan deposits at the site of the future Wheeler Ridge pumping plant of the California Aqueduct. The location, at the southern end of the San Joaquin Valley, borders on a large bowl of active land subsidence caused by compaction of the confined aquifer system under the stress of artesian-head decline. It is in an area subject also to subsidence due to near-surface hydrocompaction of moisture-deficient fan deposits. It is also an area of potential tectonic movement related to the historically active White Wolf fault. Significant susceptibility to hydrocompaction existed at depths greater than 150 feet. A special array of 24 bench marks installed within a radius of 2,400 feet from the pumping-plant site was leveled six times between August 1965 and September 1966. The areal pattern of tilting determined by the leveling agreed with the tiltmeter data in defining two principal periods of northward tilting per year; these periods coincided with the winter and summer irrigation seasons. In 1966 the total northward tilt was 42 microradians. (Knapp-USGS)

8G. Materials

USES OF METALS IN OFFSHORE STRUCTURES,
Texas A and M Univ., College Station.
L. Dale Webb.
Oceanology International, Vol 5, No 3, p 19-23, Mar 1970. 5 p, 2 fig, 3 tab.

Descriptors: *Metals, Metal coatings, *Corrosion, Fatigue (Mechanics), Chemical degradation, Corrosion control, Brittle failures, Structures, Aquatic environment, *Materials engineering, Structural design, Oceans, Materials stability, Cathodic protection, Pitting (Corrosion).
Identifiers: *Offshore structures, Electrochemical corrosion, Hydrogen embrittlement, Undersea aqueduct (Collective), Stress corrosion.

Materials for offshore structures must withstand design loads and survive the environment for necessary service life with minimal maintenance. Ordinary parameters of strength, density, cost, fabricability, and availability are necessary but not sufficient; environmental conditions must be faced. The offshore is chemical and mechanical. Marine fouling, chemical and electrochemical corrosion, fatigue fracture, hydrogen-embrittlement cracking, stress-corrosion cracking, and brittle fracture are discussed. Two tables compare the properties of metals for offshore structures. General rules for safe design of corrosion-prone structures are: (1) specify the more cathodic metals for critical structural components, (2) strive for a high ratio of anodic to cathodic metal, (3) coat cathodic members, and (4) do not coat anodic members. (USBR)

SPECIAL REPORT: FOUR PROCESSES BOLSTER FUSION WELDING,
Materials Engineering, Stamford, Conn.
John A. Vaccari.
Materials Engineering, Vol 71, No 4, p 40-46, Apr 1970. 7 p, 14 fig.

Descriptors: *Welded joints, Welders, *Welding, Electron beams, Laser, Metals, Metalwork, Metal pipes, Butt joints, Joints, Fabrication, Arc welding.
Identifiers: Welds, *Electron-beam welding, *Laser welding, Gas metal-arc welding, *TIG welding, Narrow gap welding, *Fusion welding.

Substantial progress has been made in recent years with 4 relatively new welding processes: electron beam, laser, hot wire TIG, and narrow gap welding. Advantages of electron beam welding stem from the ability to focus large concentrations of energy on a minute spot. Extremely narrow and deep welds can be made at a single pass and at much higher speeds than can be achieved by arc welding. Electron beam is suitable for welding almost any joint, most metals, a wide variety of dissimilar metals, and many nonmetallic materials. Laser welding is still a specialty process, but is being used in the electronics industry. Welds can be made in any atmosphere and through transparent materials such as inside vacuum tubes. Hot wire TIG welding has a deposition rate 3 to 5 times greater than conventional TIG welding, and is suitable for many steels and titanium and nickel alloys but is not recommended for aluminum and copper. A major commercial use is welding high-temperature, high

pressure pipe. Narrow gap welding is a gas-shielded, multipass, metal arc process designed for narrow welds in 4- to 8-in.-thick plates of ferrous and nonferrous metals. This process has advantages from reduction of the weld size, substantial savings in weld materials, fast welding speeds, and minimal residual stresses and heat-affected zones. (USBR)

RAPID-EXCAVATION CONCEPTS NOW IN FOCUS AS PARAMETERS AND DIMENSIONS EMERGE.

Engineering and Mining Journal, Vol 171, No 1, p 77-81, Jan 1970. 5 p, 3 fig.

Descriptors: *Tunneling, *Tunnel construction, Rock excavation, Costs, *Tunneling machines, Forecasting, Temperature, Automation, Research and development, Refrigeration, Gunite, *Boring machines, Tunnel pressures, Tunnel linings, Engineering geology.
Identifiers: *Rapid excavation, Tunnel supports, Raise boring, Rock pressures, Closed circuit television.

Faster tunneling at lower cost, in soft ground or hard rock, will be characteristic of mining and civil works in the next decade. Vast projects involving tunneling thousands of feet below the ground surface at phenomenal speeds will be possible. The present mode of stress relief and redistribution must be replaced by new methods. As tunneling speed is increased, tremendous increments of energy are expended in the tunnel, raising the temperature to dangerous levels. While refrigeration is the obvious answer, this may not be sufficient. Exhausting the hot air from the heading through an insulated pipe and conducting fresh refrigerated air in through another pipe may be necessary. Possibly, air will be taken into the heading in liquid form and evaporation will absorb the heat generated by the equipment. Another answer to some environmental problems is automation. The tunnel building process of the future could be almost completely automated and monitored by closed-circuit television. The labor force, other than the controllers, would be the troubleshooters and maintenance crews. Much research is in progress for developing techniques and machines for raise boring and tunneling. Some examples of these innovations are given. (USBR)
W70-08674

TUNNELING MACHINE S OF TODAY AND TOMORROW,
Jacobs Associates, San Francisco, Calif.
T. N. Williamson.
Report, National Academy of Sciences - Nat Research Council, Washington, D C, Jan 1970. 20 p, 5 fig, 10 ref.

Descriptors: *Tunneling, *Tunneling machines, Tunnel linings, Cutting, Tunnel construction, Forecasting, Underground structures, Reliability, Overbreak, Belt conveyors, Costs, Economics.
Identifiers: Tunnel supports, *Rapid excavation, Rock breakage, Cost savings, Cutters.
Much interest has been generated in tunnel boring by machine methods because of the increasing need for underground facilities. Developments in tunnel boring machine (TBM) are reviewed, beginning with the first uccessful operation in 1954 at Oahe Dam, S Dak, to the present time. More than half of the TBM applications have had at least a 40% time delay caused by inability to remove the excavated material as fast as it is produced; improvement in methods of concrete lining concurrently with boring is needed. Several advantages of tunnel boring machines are: (1) steel supports can be reduced to almost half, (2) concrete lining is reduced by 50% because of elimination of overbreak, and (3) lost time accidents are about 10% less than those on conventional tunnel jobs. Many developments are predicted for the TBM of the future. (USBR)

09. MANPOWER, GRANTS AND FACILITIES

9C. Research Facilities

UNITED STATES WATER RESOURCES RESEARCH NEEDS,
Illinois Univ., Urbana. Coll. of Agriculture.
Roland R. Renne.
In: Proceedings of Symposium on Water Balance in North America, June 23-26, Banff, Alberta, Canada, American Water Resources Association, Urbana, Illinois, p 310-315, 1969.

Descriptors: *Water requirements, *United States, *Water resources development, *Research and development, Water balance, Water supply, Interbasin transfers, Planning, Research facilities.
Identifiers: *Water resources research.

U. S. overall water supply is considerably in excess of current use and projected demand in 1980 and 2000. Nevertheless, U.S. water problems are numerous, varied, and increasing. Approximately half of the nation will have very serious water problems in 1980 and acute problems in 2000 unless new approaches and significant adaptations of traditional ones are made. Only in the past five years has the U.S. embarked on a systematic, continuing, coordinated water resources research and planning program. Because of current budget and fiscal problems, available funds for needed research and planning are lagging behind recommended levels. Research objectives should be not only to improve methodology and criteria for more productive water resources planning and development but also to determine the kinds and precision of information needed and the analyses to evaluate alternatives. Several water research areas are described and related to current and prospective U.S. needs. (See also W70-08597)

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 3, NUMBER 22
NOVEMBER 15, 1970

THE LIBRARY OF THE
DEC 15 1970
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W70-09011 -- W70-09510

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 3, NUMBER 22
NOVEMBER 15, 1970

W70-09011 -- W70-09510

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.

- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the FWPCA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

In cooperation with the Federal Water Pollution Control Administration, the following "centers of competence" have been established:

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ACOUSTIC SUBBOTTOM PROFILING SYSTEMS, A STATE-OF-THE-ART SURVEY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. T. Saucier.
Sponsored by U.S. Army Engineer Division, Lower Mississippi Valley. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report S-70-1, April 1970. 44 p, 1 tab, 13 pl, 38 ref.

Descriptors: *Seismic studies, Geophysics, Channel morphology, *Streambeds.
Identifiers: *Acoustic profiling systems.

A literature survey, data sheets, discussions with manufacturers and users, and field tests were used to assess the current status of acoustic subbottom profiling systems. Emphasis was on establishing operating principles, methods of survey operation, inherent capabilities and limitations, environmental restrictions, and availability, particularly from the standpoint of conditions and problems in the Lower Mississippi Valley area in shallow, fresh to brackish water bodies. Acoustic profiling systems are classified according to the method by which the sound energy is produced; i.e., piezoelectric and magnetostrictive transducer pingers, electromechanical-type transducers or boomers, sparkers and arcers, gas guns, air guns, and others. Either transducers or hydrophones are used to detect the reflecting acoustic signals. Operational considerations such as size and weight of equipment, and environmental considerations such as water depth were also taken into account. (Spivey-Waterways Experiment Station)

Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 17-38, June 1970. 22 p, 3 fig, 35 ref.

Descriptors: *Systems analysis, *Mathematical models, Hydrology, Operations research, Input-output analysis, Model studies, Data storage and retrieval, Simulation analysis, Digital computers, Linear programming, Dynamic programming, Computer programs.
Identifiers: Hydrologic systems.

A general theoretic framework for hydrologic systems research includes dynamical, structural, spatial and behavioral aspects of modeling with predictive powers. Many hydrologic problems can be effectively studied by systems analysis. The process of system modeling for large-scale, non-linear, time-lag systems can be rationalized by suitably identifying and modeling subsystems. When computers are used as modeling tools methods of formulating the problem, choice of the computer used, and choice of performance criteria greatly influence the results. This in turn imposes certain limits on the validity of computer simulated models. These aspects are discussed by studying the nature of hydrologic systems and the nature of the associated inverse problems and requirements for validating the models. (Knapp-USGS)

MICROELEMENTS IN ATMOSPHERIC PRECIPITATION IN THE OTKAZNENSKIY RESERVOIR AREA,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
G. S. Konovalov, and T. Kh. Kolesnikova.
Translated from Hydrochemical Materials (Gidrokhimicheskiye Materialy), Vol 49, p 74-80, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 166-170, 1969. 5 p, 1 tab, 15 ref.

Descriptors: *Trace elements, *Precipitation (Atmospheric), Chemistry of precipitation, Rainfall, Water chemistry, Water quality, Reservoirs.
Identifiers: USSR, Otkaznenskiy Reservoir.

To determine the trace elements received by Otkaznenskiy Reservoir from precipitation, samples were collected and analyzed. The precipitation collector is installed 2 m above the reservoir dam. The lid of the collector is removed only during precipitation; thus the device collects mainly liquid precipitation. The solid particles that entered the sample were atmospheric dust falling during precipitation. Boron, fluorine, bromine and iodine were determined chemically in the precipitation samples. Vanadium, manganese, cobalt, nickel, copper, molybdenum, silver, tin, lead, iron, aluminum, titanium, and bismuth were determined by the chemical-spectral method. Some of the 17 elements studied were not found in the precipitation of the Otkaznenskiy Reservoir area (cobalt, molybdenum, silver, tin, lead, and bismuth). The content of the other elements is high. This is associated with local conditions and attributable to the dry climate, scant vegetation, and wind action, which is responsible for the high dustiness of the atmosphere. (Knapp-USGS)

REASONS FOR CLIMATIC CHANGES IN THE GEOLOGICAL PAST,
Main Geophysical Observatory, Leningrad (USSR).
M. I. Budyko.
Translated from Bulletin of the USSR Academy of Sciences, Geographic Series (Izvestiya Akad. nauk SSSR, Ser. geograf.), No 1, p 5-16, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 183-192, 1969. 10 p, 6 fig, 24 ref.

Descriptors: *Pleistocene epoch, *Paleoclimatology, Climatology, Climates, Glaciers, Solar radiation, Dusts, Volcanoes, Humidity, Precipitation (Atmospheric), Synoptic analysis.
Identifiers: USSR, Climatic change.

The main climatic characteristics of various geological epochs are determined quantitatively on the basis of a numerical model of the climatic regime as a function of external factors affecting the climate. It is found that the leading causes of the development of Quaternary ice ages were changes in the transparency of the earth's atmosphere produced by volcanic activity, the uplifting of continents, and the narrowing of straits connecting the Arctic Ocean with oceans at low latitudes. INDIRECT METHOD FOR COMPUTING THE DURATION OF PRECIPITATION,
I. A. Aframeyeva.
Translated from Voyeykov Main Geophysical Observatory (Trudy GGO), No 247, p 76-81, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 139-143, 1969. 5 p, 1 fig, 5 tab, 5 ref.

Descriptors: *Precipitation (Atmospheric), *Duration curves, *Time, Depth-area-duration analysis, Frequency, Statistics, Statistical methods, Timing, Rainfall, Streamflow forecasting, Data collections.
Identifiers: Europe, USSR, Precipitation duration.

A study was made of the duration of precipitation in Western Europe. Conversion factors make it possible to calculate the duration of precipitation by using the relationship between the number of days with and the actual duration of precipitation at any station in this region. The duration of precipitation depends not only on the time of the year, but also on the physiographic conditions of a given region. Four regions are considered: (1) central part of Western Europe; (2) Scandinavia; (3) southeastern part of Western Europe; and (4) England and Ireland. Average conversion factors were computed for each of these regions and from them the average monthly total duration of precipitation was tabulated for the characteristic months of each season. Identifiers: *USSR.

The relative importance of the formation of droplets on condensation nuclei and the capture of contaminants by cloud and precipitation elements in various atmospheric layers, is evaluated. In the clean northern regions of the USSR the cloud contribution constitutes 55% of the total precipitation mineralization. In the southern regions, with heavy pollution of the atmospheric boundary layer, washout of pollutants in the subcloud layer is the predominant process. Here the cloud contribution constitutes only 20-25%. Therefore, precipitation plays a significant role in the self-cleaning of the atmosphere from admixtures of natural and artificial origin. A STUDY OF HEAT TRANSFER COEFFICIENTS IN THE LOWEST 400 METERS OF THE ATMOSPHERE,
New York Univ., Bronx. Dept. of Meteorology and Oceanography.
Sharon S. Wu.
Journal of Geophysical Research, Vol. 70, No. 8, p 1801-1807, April 1965, 6 fig, 10 ref.

Descriptors: *Heat transfer, *Air temperature, *Heat flow, Turbulence, Advection, Winds, Boundary processes, Meteorological data, Anemometers, Density.
Identifiers: *Heat exchange coefficient, Steady state, Diffusion coefficient.

The primary purpose of this study is to determine an appropriate formula for the turbulent heat exchange coefficient in the atmosphere. The heat-transfer equation for the atmosphere is integrated numerically for a 24-hour period; various forms are assumed for the heat exchange coefficient KH, which does not explicitly include effects of windshear. The excess of energy in the lower layers in the experiments might be due to the exact form of KH used. Yet, the results are in reasonably good agreement with observation. The maximum error is about 1.5 deg K when the ratio KH/Km = r is 1 and a scaling height is made a function of the local potential temperature gradient where Km is the heat exchange coefficient taking into account the wind shear. However, since the temperature at 2400 minus the temperature at 0000 is not the same at all heights, there is perhaps significant advection or a significant height gradient of advection present. This involves a process occurring in nature which is not described by the equation employed. (Osborne-Vanderbilt)

Descriptors: *Paleoclimatology, *Arctic, Glaciers, Ice, Sampling, Stable isotopes.
Identifiers: Greenland.

Using the isotopic composition of glacier ice as a climatic indicator is based on the fact that the concentration of heavy stable isotopes (deuterium and oxygen-18) in high polar snow increases with the temperature of formation of the snow. A unique possibility for studying palaeoclimates was offered when the US Army Cold Region Research and Engineering Laboratory succeeded in recovering a 1,400 meter long surface-to-bottom ice core from Camp Century on the North Greenland ice sheet. The stable isotope technique applied on the deep ice core gave an unbroken and detailed climatic record spanning probably 100,000 years. This paper presents the results of a detailed study of the ice which accumulated during the last 800 years. (Knapp-USGS)

STRONTIUM 90 CONCENTRATIONS IN SURFACE AIR: NORTH AMERICA VERSUS ATLANTIC OCEAN FROM 1966 TO 1969,
New York Operations Office (AEC), N.Y. Health and Safety Lab.
Peter C. Freudenthal.
Journal of Geophysical Research, Vol 75, No 21, p 4089-4096, July 20, 1970. 8 p, 5 fig, 2 tab, 14 ref.

Descriptors: *Fallout, *Strontium radioisotopes, Aerosols, Atmosphere, Pollutants, Precipitation (Atmospheric), Atmospheric physics, Meteorology, Atlantic Ocean.
Identifiers: North America.

Strontium 90 in surface air has been measured continually for three years, February 1966 to January 1969, at four North Atlantic Ocean weather stations to compare fallout processes over the ocean with those over land. Between 35 deg N and 55 deg N, concentrations over land were an average 1.1 times greater than those over the ocean. The relative concentration varied with both season and latitude, being greater in the north and during the summer. This variation seems to correlate better with monsoonal meteorological processes than with the suggested process of aerosol scavenging by ocean spray. (Knapp-USGS)

WATER VAPOR BALANCE OF THE ATMOSPHERE FROM FIVE YEARS OF HEMISPHERIC DATA,
Massachusetts Inst. of Tech., Cambridge. Dept. of Technology.
Jose P. Peixoto.
Nordic Hydrology, Vol 1, No 2, p 120-138, 1970. 19 p, 6 fig, 25 ref. NSF Grant No GA-1310X.

Descriptors: *Water balance, *Climatology, *Synoptic analysis, *Climatic data, Hydrologic cycle, Data processing, Mapping, Topography, Weather data, Automation, Charts, Data collections, Maps, Networks, Surveys, Synthesis, Weather forecasting.
Identifiers: Atmospheric water vapor balance.

The atmospheric balance of water vapor for the northern hemisphere was investigated through entirely automatic data processing and objective analysis procedures, to assess the potentialities of these methods by examining a large sample of results. The study was based on five years of daily observations taken at about 800 meteorological stations. The final maps of the distribution fields of mean precipitable water content and of zonal and meridional transports of water vapor in the atmosphere are presented and discussed. The structure and the implications of the water vapor divergence map for hydrology are treated. Finally the water vapor balance on a planetary scale is discussed and the results are compared with evidence obtained from climatological and hydrological sources. The five-year averages of the various fields appear to give consistent results and mainly agree with previous findings. The areas of highest water vapor content are shown over the equatorial regions of South America, eastern and western Pacific, the Indian Ocean, and equatorial West Africa. The region of lowest precipitable water is found over the Arctic. (Knapp-USGS)

C. Snow, Ice, and Frost

IETHODS OF COMPUTING MAXIMUM SOIL REEZING DEPTH,
I. V. Zavarina.
ranslated from Voyeykov Main Geophysical Ob-ervatory (Trudy GGO), No 246, p 73-82, 1969. oviet Hydrology: Selected Papers, Issue No 2, p 31-139, 1969. 9 p, 3 fig, 1 tab, 11 ref.

)escriptors: *Frost, *Frozen soils, *Forecasting, lanning, Construction, Freezing, Melting, Synop-c analysis, Surveys, Frequency analysis, Probabili-y, Climatology, Mapping, Data collections, Cli-natic data.
lentifiers: Frost forecasting, USSR.

The Hydrometeorological Service of the USSR has ollected extensive observational data on soil tem-erature at various depths. From the long-period ecords it is now possible to construct curves of the ntegral frequency of various air temperatures or oil freezing depths and to determine values of iven integral probability. Nomograms are given or computing freezing depths and probabilities nder natural cover. Depth of freezing under bare oil was determined at only a few stations; there-ore, there is more uncertainty in frost forecasting n urban areas than in the vegetated areas. (Knapp-JSGS)

AN ANALYSIS OF ICE LENS FORMATION,
Army Terrestrial Sciences Center, Hanover, N.H.
Shunsuke Takagi.
Water Resources Research, Vol 6, No 3, p 736-749, June 1970. 14 p, 3 fig, 1 tab, 39 ref.

Descriptors: *Frost, *Freezing, *Frost heaving, Frost action, Frozen ground, Ice, Soil water move-ment, Heat transfer, Mass transfer, Mathematical models, Mathematical studies, Adsorption.
Identifiers: Ice lenses (Frost).

A mechanism of ice lens formation is based on the assumption that its main cause is the simulataneous flow of heat and water. The differential equations thus formulated are solved approximately by the use of a generalization of Goodman's integral method. The result is not completely satisfactory when compared with an experiment. The existence of a solution to the differential equations of ice lens formation is demonstrated. The solution exists for a very narrow range of initial water content deter-mined by the amount of surcharge on the ice lens. The narrowness of the range probably accounts for the observed intermittence of lenses. The Good-man technique or any generalization of it cannot yield a satisfactory solution of the problem. A sim-plification of Portnov's method has been found. With development of the mathematical method, improvements in the assumed mechanism, and refinements in the measurements of soil properties, we may be able to completely formulate frost heav-ing and thereby solve a long-standing problem. MEASUREMENT OF THE THERMAL CON-DUCTIVITY OF FROST BY A TRANSIENT HOT-WIRE TECHNIQUE,
North Carolina State Univ., Raleigh. Dept. of Mechanical and Aerospace Engineering.
J. C. Mulligan.
Journal of Geophysical Research, Vol 75, No 21, p 4180-4183, July 20, 1970. 4 p, 3 fig, 8 ref.

Descriptors: *Frost, *Frozen ground, *Instrumen-tation, *Thermal conductivity, Thermometers, Soil physical properties, Geothermal studies, Heat flow.
Identifiers: Hot-wire thermometers.

A transient method of measuring thermal conduc-tivity is described, along with the results of some experiments with frost. The method utilized a fine wire thermojunction, which is imbedded in the frost and heated at a constant rate with a radio frequency current. The transient temperature response of the wire is then obtained by electronic filtering and is related to the thermal properties of the frost by the theory of heat conduction from a line heat source in an infinite medium. The technique was found to work well with frost and is believed to provide a means of making the rapid and local measurements that are necessary for non-homogeneous and transient media. (Knapp-USGS)

CHARACTERISTICS OF PERMAFROST AND OF THE ACTIVE LAYER IN WEST SIBERIA,
N. A. Shpolyanskaya.
Translated from Herald of Moscow State Universi-ty, Geographic Series (Vestnik MGU, ser. geogr.), No 3, p 88-94, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 195-200, 1969. 6 p, 2 fig, 2 tab, 8 ref.

Descriptors: *Permafrost, *Arctic, *Tundra, Frozen soils, Frozen ground, Mapping, Surveys, Soil types, Cold regions, Ice, Soil properties, Cli-matology, Paleoclimatology, Pleistocene epoch.
Identifiers: *USSR, *West Siberia.

The distribution and temperature of present-day permafrost in West Siberia are determined by two major factors: first, the present climate and heat exchange between the soil surface and the at-mosphere, and, second, the evolution of permafrost in the Quaternary. The history of permafrost in West Siberia is peculiar in that the permafrost partly thawed from the surface during the Holocene, stopped thawing, and then the rocks froze again. Three large regions formed as a result of this freezing that differ in the ratio of layers of recent and old permafrost. These are the region of continuous recent and old (relict)permafrost, the region of scattered permafrost, and the region of old, deep-seated permafrost. Each of these regions is subdivided into geothermal zones that differ in the temperature, thickness, and spatial ratio of thawed and frozen rocks. They show distinct zonality, determined by the corresponding distribu-tion of present physiographic conditions in West Siberia. (Knapp-USGS)

EXPERIENCES WITH SNOW PILLOWS IN NORWAY,
Norwegian Water Resources and Electricity Board, Oslo.
Arne Tollan.
Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 113-120, June 1970. 8 p, 6 fig, 6 ref.

Descriptors: *Snow surveys, *Precipitation gages, *International Hydrological Decade, Snowmelt, Snowpacks, Streamflow forecasting, Snow manage-ment, Water yield, Gaging stations, Data collec-tions.
Identifiers: Snow pillows, Norway.

Snow pillows have been in use since 1961-62 in the USA and a great number of snow pillows are now in operation in USA and Canada. From the winter 1967-68 a snow pillow has been in operation in the representative basin Filefjell in Norway. Two addi-tional pillows were installed during the winter 1968-69 in the representative basins Romerike and Sagelva. This report summarizes experience with snow pillows in Filefjell and Romerike as a part of the program conducted by the Norwegian national committee for the IHD. Snow pillows have proved to be a powerful tool in the study of reliability of conventional precipitation measurements, particu-larly in mountain areas. Combined with measure-ments of snowmelt run-off, pillow records may also throw light on the question of evaporation from snow cover. Pillow sites should be selected near ex-isting meteorological stations, or be equipped with a certain minimum of meteorological instruments like precipitation gage, thermograph and anemometer. When reliable and sufficient observa-tions are available, pillow records can be used to study melt water formation as a function of climatic parameters. If the purpose of the pillow is flood forecasting or prognosis of inflow to reservoirs, it is

of utmost importance to choose representative sites, based on extensive field surveying. (Knapp-USGS)

THE PHYSICS OF GLACIERS,
Commonwealth and International Library of Science Technology, Engineering and Liberal Studies, Ottawa (Ontario).
W. S. B. Paterson.
London, Pergamon Press, Ltd, 1969, 250 p.

Descriptors: *Glaciers, *Flow, *Ice, *Rheology, Freezing, Melting, Snow, Mechanical properties, Plasticity, Viscosity, Physical properties, Mathematical studies.
Identifiers: Glacier physics.

The physical principles underlying the behaviour of glaciers and ice sheets are explained, as far as they are understood at the present time. While the book is intended primarily for those starting research in the subject, established workers in glacier studies and in related fields should find it useful. The treatment is at about the graduate student level. The approach of the test emphasizes physics combined where necessary with mathematics. Mathematical physicists who may seldom set foot on a glacier, have contributed greatly to the understanding of the subject. In glaciology, as in other branches of science, both the theoretical and the experimental approach should be coordinated; the experiments should be designed to investigate specific problems. (Knapp-USGS)

2D. Evaporation and Transpiration

INFLUENCE OF EVAPORATION FROM LAKE BAIKAL ON PRECIPITATION IN THE SURROUNDING REGIONS,
V. I. Korniyenko.
Translated from Voyeykov Main Geophysical Observatory (Trudy GGO), No 147, p 122-127, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 144-148, 1969. 5 p, 2 fig, 3 tab, 2 ref.

Descriptors: *Evaporation, *Lakes, *Precipitation (Atmospheric), *Climatology, Rainfall disposition, Humidity, Water balance, Winds, Weather, Weather patterns.
Identifiers: *USSR, *Lake Baikal.

Lake Baikal, a large (31,500 sq km) deep-water mountain lake, has a cooling effect on the adjoining regions in summer and a warming effect in winter. The temperature difference between the water surface and the air is 13-15 deg C in December. Owing to the orographic characteristics of the lake shore, this influence cannot reach far beyond the limits of watersheds. The effect of evaporation from Lake Baikal on precipitation in the surrounding regions was computed for the ice-free period from May to December for two years, 1963 with precipitation below normal, and 1965 with precipitation above normal. The contribution of evaporation from the lake to the change in moisture content is extremely small or nonexistent in summer. The influence of evaporation from Lake Baikal is strongest on the southeast shore in November December when evaporation is strong and the moisture content of the air is extremely low. The maximum station increase in precipitation is within 3-5% in October, 13-16% in November, and 10-15% in December. (Knapp-USGS)

AN ENERGY BUDGET STUDY ABOVE THE FOREST CANOPY AT MARMOT CREEK, ALBERTA, 1967,
Meteorological Service of Canada, Calgary (Alberta).
D. Storr, J. Tomlain, H. F. Cork, and R. E. Munn.
Water Resources Research, Vol 6, No 3, p 705-716, June 1970. 12 p, 12 fig, 3 tab, 17 ref.

Descriptors: *Evapotranspiration, *Energy budget, *Forests, Demonstration watersheds, Rainfall-runoff relationships, Solar radiation, Water balance, Convection, Heat transfer, Mass transfer, Photosynthesis, Winds, Diffusivity.
Identifiers: *Marmot Creek Experimental Watershed (Canada), Alberta (Canada).

For a 19-day period in July 1967, daily estimates of evapotranspiration were obtained from hourly calculations of the Bowen ratio above the forest canopy in the Marmot Creek Experimental Watershed, Alberta, Canada. The estimates ranged from 7.9 mm to 1.5 mm. The Bowen ratio was found to be very dependent on wind direction, sky condition, and basin aspect, (which was a significant factor). Although the area is unhomogeneous, the results appear reasonable when compared with other estimates of evapotranspiration. (Knapp-USGS)

Descriptors: *Evaporation control, *Reservoir evaporation, Energy budget, Solar radiation, Heat transfer, Evaporation.
Identifiers: Floating covers (Reservoir).

A theoretical analysis of the energy balance equation for a partially covered body of water indicates that surface reflectance for solar radiation and infrared emittance are important properties to consider in designing covers for maximum efficiency in reducing evaporation. White materials satisfy the requirement that both these parameters be as large as possible. Experiments were conducted on insulated evaporation tanks partially covered with foamed wax, lightweight concrete, white butyl rubber, and styrofoam. Several shapes and sizes were tested. The radiative properties of the cover were again noted to be important, and thin covers proved to be slightly more efficient than thick insulated covers. Evaporation reduction was proportional to the percent of surface area covered, the constant of proportionality depending upon the color and type of materials used. For the white, impermeable materials tested, the constant of proportionality was near unity. The reduction in evaporation was also highly correlated with the reduction in net radiation. (Knapp-USGS)

WATER USE BY SALT CEDAR,
Geological Survey, Lubbock, Tex.; and Texas Tech Univ., Lubbock.
T. E. A. van Hylckama.
Water Resources Research, Vol 6, No 3, p 728-735, June 1970. 8 p, 6 fig, 4 tab, 10 ref.

Descriptors: *Evapotranspiration, *Consumptive use, *Tamarisk, Phreatophytes, Evapotranspiration control, Water conservation, Water yield improvement, Clear-cutting, Soil-water-plant relationships, Lysimeters.
Identifiers: Phreatophyte control.

Six years of observations on water use by salt ced conducted in a battery of evapotranspirometers, tanks, have shown that thinned out stands nearly as much water as control tanks if the wate of good quality. It is concluded that the method making a vegetation survey and then extrapolat water use as measured in evapotranspirometers t 100% density can lead to serious overestimation water use. Thinning and cutting are ineffect methods of saving water. In cutoff stands, un favorable conditions, shoots can increase in len by as much as 5 cm per day. Only a few plants su as bamboo and cucumber are reported to gr faster than that. The assumption t phreatophytes always transpire at a potential rat not sustained by the facts presented in this pap When differences in depth to water as small as to 2.1 meters and 2.1 to 2.7 meters affect the wa use, it seems reasonable to conclude that wit water table at four meters for instance (a situat not unusual along dry river beds), salt cedar may thrive but use comparatively little water, the claims as to the quantity of water potenti saved by their eradication could well be overe mated. (Knapp-USGS)

DISPOSAL OF BRINE BY SOLAR EVAPOR TION: FIELD EXPERIMENTS,
New Mexico State Univ., University Park.
C. G. Keyes, Jr., Narendra N. Gunaji, Jesse V. Lunsford, and William D. Loth.
For sale by Supt. of Documents, U.S. Governm Printing Office, Wash., D.C. 20402-Price $1.50 copy. Office of Saline Water Research Development Progress Report No. 563, May 19 166 p, 15 tab, 15 fig, 36 ref, 7 append. OSW C tract No. 14-01-0001-969.

Descriptors: *Brine disposal, *Evaporation, *En gy balance, *Evaporation pans, Solar evaporatio
Identifiers: Evaporation enhancement, Effici dye, Evaporation ponds, Evaporation compu Solar radiation.

Field studies on the determination of evaporat of brine by methods of energy budget, water bud and mass transfer are described. Experiments w performed using insulated pans and ponds at b the Roswell, N. M. Test Facility and the New M ico State University. Although the use of Napht Green enhanced the evaporation rate, the costs evaporation decrease with increasing plant cap ty; however the lowest unit cost for desalted wa and waste disposal by evaporation, is at a capa of 75 MGD. A DIURNAL DISTRIBUTION FUNCTION F DAILY EVAPORATION,
Commonwealth Scientific and Industrial Resea Organization, Canberra (Australia). Div. of L Research and Regional Survey.
P. M. Fleming.
Water Resources Research, Vol 6, No 3, p 9 942, June 1970. 6 p, 6 fig, 12 ref.

Descriptors: *Mathematical models, *Wa balance, *Evaporation, *Energy budget, *So radiation, Lysimeters, Statistical mod Evapotranspiration.
Identifiers: Daily evaporation patterns.

Some deterministic mathematical models hydrologic processes require an approximate d nal distribution of evaporation. The problem estimating the diurnal distribution of evapora rates is examined when only total daily evapora is given. Two cases are considered, clear days, nondimensional distribution functions developed for each case. Application of the tribution functions requires a knowledge of time of sunrise and daylength. Operating rule decide which distribution function to employ given in terms of alternate data, sunshine ho solar radiation, and daily evaporation. The prel

ary nature of the results is emphasized. (Knapp-USGS)

WATER TRANSPORT IN SOILS BY EVAPORATION AND INFILTRATION,
Rothamsted Experimental Station, Harpenden (England).
D. A. Rose.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 171-181, 1968. 11 p, 6 fig, 1 tab, 20 ref.

Descriptors: *Evaporation, *Soil moisture, *Soil water movement, Percolation, Moisture content, Field capacity, Mathematical studies, Humidity, Drying, Diffusion, Laboratory tests, On-site tests.
Identifiers: Soil water evaporation.

The equation of vertical flow is adapted to describe the evaporation of water from, and the uptake of water by a deep uniform soil free from vegetation. The theory is examined by laboratory measurements on long columns of 0.5 - 1.0 mm aggregates of three soils from Rothamsted and Woburn. Evaporation from soils initially at a uniform moisture content--field capacity--decreases as the square root of time, and causes moisture profiles which differ for each soil. Drying diffusivities calculated from these profiles have an unusual shape, decreasing to a minimum and then increasing as the moisture content falls from field-capacity to air-dryness. The uptake of water treated in the same way yields wetting diffusivities which also display a prominent minimum as moisture content increases from air-dryness to field capacity. MAP OF EVAPORATION FROM SMALL RESERVOIRS OF THE CENTRAL CHERNOZEM PROVINCES,
L. F. Forsh.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic; collection of papers translated for U S Agricultural Research Service p 144-165, 1967. 22 p, 7 fig, 4 tab, 10 ref.

Descriptors: *Evaporation, *Reservoirs, *Lakes, *Ponds, Chernozems, Mapping, Meteorological data, Limnology, Winds, Vapor pressure, Water temperature, Humidity, Seasonal, Air temperature, Statistical methods, Stations.
Identifiers: *USSR, Chernozem Provinces.

Data recorded at the small reservoirs and ponds of Kursk Province, USSR, during the summer months of 1956 to 1960, were analyzed and maps of the monthly evaporations in the Central Chernozen Provinces were drawn. This type of evaporation map must be used only as a guide in obtaining values of surface evaporation from reservoirs in the Central Chernozem Provinces, since in every individual case the values shown on the maps are subject to local conditions. Moreover, the accuracy of calculation of evaporation by using the Forsh (1963) formula lies within a range of 10 percent. The coefficients for converting evaporation to the 3 and 20 percent frequency given in this paper are useful in practical application. (See also W70-09312) (Gabriel-USGS)

2E. Streamflow and Runoff

RUNOFF SYNTHESIS FOR RAIN-ON-SNOW BASIN,
Corps of Engineers, Portland, Oreg. North Pacific Div.
James A. Anderson, and David M. Rockwood.
38th Annu Meet Western Snow Conf, Victoria, Can, Apr 1970. 21 p, 7 fig, 3 tab, 10 ref.

Descriptors: *Watersheds (Basins), Streamflow, *Synthesis, *Synthetic hydrology, Runoff, Rainfall-runoff relationships, *Snowmelt, Hydrology, Snowpacks, Precipitation (Atmospheric), Rainfall.
Identifiers: *SSARR (Acronym), *Hydrologic models, Willamette River Basin, Oreg.

The hydrologic elements and resulting computed runoff for the Willamette Basin Snow Laboratory in Oregon, for 1949-50 and 1050-51, were synthesized using the SSARR (streamflow synthesis and reservoir regulation) model. Results show that the watershed model of the SSARR computer program, when operated in a zonal mode, can adequately represent all hydrologic factors. The program can synthesize streamflow on a continuous basis for rain-on-snow basins, affecting runoff in a completely general manner, and can maintain continuity of the snowpack accumulation and melt throughout winter and spring. The program also can differentiate between the varying conditions of runoff and snowpack on an elevation basis. This is accomplished by subdividing a drainage basin into bands or zones of equal elevation, for which runoff conditions and streamflow conditions are computed individually. (USBR)

RECONNAISSANCE OF WATER RESOURCES IN THE HAINES-PORT CHILKOOT AREA, ALASKA,
Geological Survey, Washington, D.C.
James A. McConaghy.
Available free on request to the US Geological Survey, Wash, DC, 20242. US Geological Survey Circular 626, 1970. 16 p, 5 fig, 3 tab, 11 ref.

Descriptors: *Water resources, *Alaska, Water supply, Cities, Surface waters, Groundwater, Water yield, Water quality, Water wells, Water resources development.
Identifiers: Haines (Alaska), Port Chilkoot (Alaska).

The most obvious source of fresh water in the Haines-Port Chilkoot area of Alaska is the Chilkat River. It is nearby, has a dependable flow, and generally has satisfactory chemical quality; however, the river contains glacial flour or suspended silt that causes a milky appearance and which is difficult to remove. Creeks in the area do not have adequate water for dependable public supply. Groundwater is the best source of additional water in the area. There are few wells in the area and consequently groundwater data were sparse. Exploratory auger drilling was the principal method used to obtain new groundwater data. In addition, surface-water supplies were inventoried and water samples were collected for chemical analysis. (Knapp-USGS)
W70-09130

HYDROLOGY OF THE UPPER MALAD RIVER BASIN, SOUTHEASTERN IDAHO,
Geological Survey, Washington, D.C.
E. J. Pluhowski.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price $0.45 (paper cover). US Geological Survey Water - Supply Paper 1888, 1970. 89 p, 35 fig, 11 tab, 32 ref.

Descriptors: *Water resources, *Groundwater basins, *Watersheds (Basins), *Idaho, Groundwater, Surface waters, Water yield, Water balance, Water utilization, Irrigation water, Recharge, Discharge (Water), Floods, Rainfall-runoff relationships.
Identifiers: Malad River (Idaho).

The Malad Valley comprises 485 sq mi in the Basin and Range physiographic province. Relief is about 5,000 ft; the floor of the Malad Valley is at an average altitude of about 4,400 ft. The climate is semiarid throughout the Malad Valley and its principal tributary valleys; above 6,500 ft the climate is subhumid. Annual precipitation ranges from about 13 inches in the lower Malad Valley to more than 30 inches on the highest peaks of the Bannock and Malad ranges. Annual water yields in the project area range from about 0.8 inch in the lower Malad Valley to more than 19 inches on the high peaks north and east of Malad City. The mean annual water yield for the entire basin is 4 inches, or about 115,000 acre-feet. Evaporation is greatest in July when about 7 inches is lost from lakes, reservoirs, and waterlogged areas; losses from free-water surfaces may be as much as 38 inches annually. An extensive groundwater reservoir consisting of sand and gravel interbedded with relatively impermeable beds of silt and clay underlies much of the Malad Valley. On the basis of a water-balance analysis, underflow from the project area was estimated to be 28,000 acre-feet annually, surface-water outflow was 51,000 acre-feet, and transbasin imports were about 4,000 acre-feet. The total water yield is not sufficient to meet all the water needs of the basin. A comprehensive water-management plan is required to ensure optimal use of the water resource. (Knapp-USGS)

TURBULENCE MEASUREMENTS NEAR THE FREE SURFACE OF AN OPEN CHANNEL FLOW,
Illinois Univ., Urbana.
E. R. Holley.
Water Resources Research, Vol 6, No 3, p 960-963, June 1970. 4 p, 3 fig, 6 ref.

Descriptors: *Open channel flow, *Turbulence, *Free surface, Instrumentation, Measurement, Anemometers, Current meters, Model studies, Hydraulic models, Flumes, Calibrations.
Identifiers: Turbulence meters.

Turbulence spectrums were obtained from 0.006 inch to 1 inch below the free surface of an open channel flow with a depth of 6 inches and a mean velocity of 0.93 fps. No significant variation in the spectrums was observed for the different distances below the surface. The data tend to substantiate the presence of turbulence in the region which is sometimes called the surface film in reaeration studies. (Knapp-USGS)

CALIBRATION OF WALNUT GULCH SUPERCRITICAL FLUMES,
Agricultural Research Service, Stillwater, Okla. Soil and Water Conservation Research Div.
Wendell R. Gwinn.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY8, Paper 7479, p 1681-1689, August 1970. 9 p, 4 fig, 2 ref, append.

Descriptors: *Stream gages, *Stage-discharge relations, *Supercritical flow, *Flumes, Alluvial channels, Gaging stations, Model studies, Sediment transport, Flowmeters.
Identifiers: Stream-gaging flumes.

A new supercritical measuring flume is being used to gage sediment-laden ephemeral flows in steep channels. The transition from the natural channel to the straight modified trapezoidal measuring section of the flume consists of a cylindroid surface. The flume is kept free of deposition by a V-shaped floor which slopes in the direction of the flow. The head is measured at the midpoint of the straight section. Ten of these concrete flumes have been installed in the Walnut Gulch Watershed near Tombstone, Arizona. Eight of the flumes have already been calibrated with models in the laboratory. The largest has a bottom width of 120 ft and a capacity of about 26,000 cfs. This structure is the largest known precalibrated flume now in operation. The design of the flumes, the laboratory calibration data and some observations of their field operation are analyzed. (Knapp-USGS)

DISPERSION PREDICTION FROM CURRENT METERS,
Ontario Water Resources Commission, Toronto. Water Quality Surveys Branch.
Mervyn D. Palmer, and J. Bryan Izatt.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY8, Paper 7464, p 1667-1680, August 1970. 14 p, 8 fig, 6 tab, 9 ref, append.

Descriptors: *Dispersion, *Diffusion, *Current meters, *Lake Erie, Forecasting, Hydraulics, Turbulence, Turbulent flow, Correlation analysis, Probability, Path of pollutants.
Identifiers: Turbulence meters.

Two-dimensional dispersion plumes for the near shore area of Nanticoke on Lake Erie are predicted by applying turbulent diffusion concepts to recording current meter data. Eulerian integral time scales are found from autocorrelation coefficients, based on monthly data. Lagrangian integral space scales and one-dimensional diffusion coefficients may be predicted. Average monthly probability distributions are based on north-south and east-west diffusion coefficients. The prediction equation is an average of long and short time diffusion equations. Better dilution is found near the shore and parallel to it. It is assumed that vertical diffusion is negligible, that the Reynold's number is large, and that the effective diffusion coefficients are constant over long periods. (Knapp-USGS)

FLOOD OF AUGUST 1969 IN VIRGINIA,
Geological Survey, Richmond, Va.
J. D. Camp, and E. M. Miller.
US Geological Survey Open-file report, 1970. 120 p, 31 fig, 1 plate, 4 tab.

Descriptors: *Historic flood, *Virginia, *Hurricanes, *Cloudbursts, *Flood damage, Stage-discharge relations, Rainfall-runoff relationships, Precipitation (Atmospheric), Storm runoff, Water levels, Hydrographs, Landslides, Erosion, Sedimentation.
Identifiers: Hurricane Camille (1969).

Hurricane Camille became a tropical depression and soaked central Virginia with up to 28 inches of rain during the night of August 19th and morning of the 20th, 1969. The rains, flash floods, and rain-induced landslides accompanying the storm's passage have been called the worst natural disaster ever to strike Virginia. Discharge of streams in the James, Potomac, Rappahannock, and York River basins exceeded previous known maximums. At Tye River near Lovingston the peak flood discharge was eight times the previous high during the 31 years of record. James River stations downstream from the Maury River recorded peak flows of greater than 100-year recurrence interval. As of Nov. 13, 1969, the State had counted 113 dead and 102 injured with 39 persons still missing. The total damage amounted to over $116 million. This report provides hydrologic data needed for planning and design. The report includes a general description of the flood; precipitation information; sediment aspects of the flood; and records of stage and/or discharge for 105 sites. (Knapp-USGS)

FLOODS IN IOWA,
Geological Survey, Iowa City, Iowa.
Harlan H. Schwob.
In: Flood Plain Management - Iowa's Experience, Papers presented at Conference on Flood Plain Management, 6th Water Resources Design Conference, Jan 23-25, 1968, Iowa State University; published by Iowa State University Press, Ames, p 27-35, 1969. 9 p, 3 fig, 12 ref.

Descriptors: *Floods, *Iowa, *Rainfall-runoff relationships, Flood forecasting, Flood protection, Flood damage, Flood plains, Statistics, Statistical methods, Historic flood, Maximum probable flood.
Identifiers: *Mean annual flood.

The greatest floods recorded in Iowa are listed, analyzed, and discussed. Multiple regression analysis was made of the flood data for Iowa rivers. This resulted in the division of the state into two hydrologic regions, with a formula being developed for each region permitting the mean annual flood (MAF) to be computed. The variables include drainage area, stream slope, and for most of the state the normal annual precipitation. The mean annual flood is described quantitatively as the mean of the annual flood peak discharges that would be derived from a very long streamflow record. The use of the mean annual flood to help define outstanding flood discharges is an attempt to place the data for different areas of the state on a common basis. The flood data presented serve to point out the potential and the extent of major floods known to have occurred within Iowa. These data can be used to assist in planning programs for flood plain management. (See also W70-09253). (Knapp-USGS)

A NOTE ON THE ESTIMATION OF THE PARAMETERS IN LOGARITHMIC STAGE-DISCHARGE RELATIONSHIPS WITH ESTIMATES OF THEIR ERROR,
C. Venetis.
Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 105-111, June 1970. 7 p, 1 fig, 1 tab, 7 ref.

Descriptors: *Stage-discharge relations, *Statistical methods, *Estimating, Regression analysis, Streamflow forecasting, Open channel flow, Channel morphology, Discharge coefficients, Least squares method, Water levels.
Identifiers: Graphic estimation methods.

Under certain assumptions the stage-discharge relationship of a channel cross-section can be approximated by a logarithmic relationship. Observational pairs of stage and discharge plotted on log-log paper often cluster around a straight line and this suggests that the assumptions involved are often approximately satisfied. In such cases the parameters of the logarithmic relationship are usually estimated graphically from the position and slope of the straight line on the log-log paper. In this paper principles and methods are outlined for the estimation of the parameters with estimates of their standard error, via regression analysis. Because the water level of zero flows is usually one of the unknown parameters, the regression is non-linear and least squares optimal estimates can be obtained by a step-by-step approximation. The variances of the parameter estimates can be obtained from the dispersion matrix of the joint distribution of the least squares estimators via the likelihood function. An estimate of the error in predictions of the discharge depending on the corresponding stage may be obtained. (Knapp-USGS)

FLOOD SERIES FOR GAGED PENNSYLVANIA STREAMS,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
B. M. Reich.
Available from NTIS as PB-193 704, $3.00 in paper copy, $0.65 in microfiche. Institute for Research on Land and Water Resources, Research Publication No. 63, University Park, Pa., Dec. 1969. 83 p, 1 tab, 5 fig, 21 ref. OWRR Project A-016-PA (1).

Descriptors: *Stream gages, *Stream flow, *Water year, *Return flow, *Watershed management, Gaging stations, Pennsylvania, Flood forecasting, Frequency analysis, Social aspects.
Identifiers: *Horizontal asymptote, *Gumbel paper, *Except outlier, Weibull formula, Extreme events, Flood frequency curve, Return period.

Modern analyses of flood records for 84 locations on Pennsylvania streams are presented for engineering practitioners to judge for fit to three mathematical curves. Extreme value plots report the greatest instantaneous peak discharge for each water year. Floods are arranged in order of magnitude for each watershed and plotted as points on extreme value paper. Exact locations to which the data apply are described. For each plot the following information is given: major river basin in which each stream is located, stream name, area in square miles of each topographic drainage basin, number of years of data available, mean of the annual series of floods in cubic feet per second, standard deviation of the annual series in cfs, and coefficient of skewness of the logs (to base 10) of the annual series values. Practitioners are asked to judge the general trend of the observed flood curves and rate

em as to fit for Gumbel lines, Log-Gumbel rves, or Log-Pearson Type III curves. Judgments to whether a horizontal asymptote will ultimately reached and also for except outliers are also quested. Questionnaires are included in the blication. Results from these questionnaires will analyzed anonymously and submitted for publi-tion in a technical journal where hydrologists can press their opinions in printed discussions. entifiers: Reservoir modifications, Groundwater stem, Norfork Dam (Ark), Clearwater Dam Mo), Hawthorne Reservoir (Nev), Seepage con-l.

study of groundwater conditions within and ad-cent to a proposed reservoir is an initial require-ent of investigations for constructing a dam. asic principles for a reservoir groundwater study e illustrated by case histories. The relationships etween the natural groundwater level and akage, and subsurface hydraulic effects caused by reservoir are discussed. The groundwater survey ould include map study; field reconnaissance; view of literature; and field measurements of ater wells, flow from springs, chemical analysis, nd groundwater flow rates. The cost of a ground-ater study is low and is an investment that yields a gh return in terms of trouble and expenses oided. Because of the usual initial slow rate of roundwater adjustment to new reservoirs, studies ould continue during the first several years of eservoir operation to detect changes in water vels that could develop into leakage. ETHOD FOR COMPUTING GROUNDWATER EVEL FLUCTUATIONS,
V. Vol'ftsun.
ranslated from State Hydrologic Institute (Trudy GI), No 165, p 128-147, 1969. Soviet Hydrology: elected Papers, Issue No 2, p 115-130, 1969. 16 p, fig, 4 tab, 2 ref. 3 append.

escriptors: *Water level fluctuations, *Ground-ater, *Water balance, *Hydrologic budget, Infil-ration, Precipitation (Atmospheric), Recharge, vapotranspiration, Discharge (Water), Ground-ater movement, Water table, Surface-ground-ater relationships.
dentifiers: Groundwater-level fluctuations.

A water balance method can be used to calculate roundwater-level fluctuations during the growing eason. For coarse-texture soils and a groundwater epth of about 1.5 m, when the seepage time of recipitation through the aeration zone is 1 day or ess, when there is no backwater from rivers or akes, and no water exchange between aquifers, the nethod of computation described can be used to recalculate the groundwater level one day in ad-ance. It can also be used to predict fluctuations of low over a long period preceding a given data, rom precipitation, air moisture deficit, and wind speed data. It is possible to determine the effect of uman activity, such as for example, the planting of orests, various agricultural practices, etc., on groundwater level regime and surface runoff in the catchment. (Knapp-USGS)

NUMERICAL MODELING OF UNSATURATED GROUNDWATER FLOW AND COMPARISON OF THE MODEL TO A FIELD EXPERIMENT,
Kansas Univ., Lawrence, and Geological Survey, Garden City, Kans.
Don W. Green, Hassan Dabiri, Charles F. Weinaug, and Robert Prill.
Water Resources Research, Vol 6, No 3, p 862-874, June 1970. 13 p, 13 fig, 2 tab, 19 ref. OWRR Project B-018-KAN.

Descriptors: *Groundwater movement, *Soil water movement, *Surface-groundwater relationships, *Unsaturated flow, *Mathematical models, Computer models, On-site tests, Wetting, Drying, Pit recharge, Ponds, Recharge, Percolation, Numerical analysis, Porous media.
Identifiers: 2-phase flow (Soil water).

A mathematical model describing isothermal, two-phase flow in porous media consists of differential equations, using algorithms for their numerical solution. It was applied to the problem of vertical groundwater movement in unsaturated soils in the absence of evaporation and transpiration. The equations describing water-air flow through porous media are second order, nonlinear partial differential equations. These equations were converted to finite difference form and were solved with the aid of a digital computer using an iterative implicit procedure. The model includes effective permeabilities of each phase and capillary pressure as functions of liquid saturation. The properties of the porous media may be varied in the model as functions of position. A comparison was made between computed results and experimental field data on moisture movement beneath a shallow surface pond. Water was added to the pond at controlled rates to maintain an approximately constant head for a set time period. Following this wetting period the pond was kept dry, but covered to reduce evaporation. The experiment was simulated with the computer model and excellent agreement between calculated results and the data was obtained. (Knapp-USGS)

TWO-DIMENSIONAL DISPERSION EXPERIMENTS IN A POROUS MEDIUM,
California Univ., Santa Barbara.
John C. Bruch, Jr.
Water Resources Research, Vol 6, No 3, p 791-800, June 1970. 10 p, 7 fig, 1 tab, 9 ref.

Descriptors: *Dispersion, *Porous media, *Groundwater movement, Convection, Seepage, Mixing, Flow, Density, Viscosity, Model studies, Hydraulic models, Laboratory tests.
Identifiers: Two-dimensional dispersion.

A series of two-dimensional dispersion experiments were performed in a one-and-two-layered porous medium. The experimental results were compared with a theoretical and a numerical solution both of which describe the two-dimensional dispersion of a miscible, second fluid through a unidirectional, seepage flow. The combined effect of longitudinal and lateral dispersion was considered in all cases. The experimental results and their comparisons with the numerical values clearly demonstrate the need to consider the combined effect of longitudinal and lateral dispersion in the analysis of the propagation of a miscible fluid in groundwater flow. If lateral dispersion were not considered, there would be no salt concentration at the position discussed. These, as well as the other results presented, also verify the use of the theoretical solution and the numerical scheme as accurate models for the two-dimensional dispersion phenomenon. (Knapp-USGS)

DIGITAL ANALYSIS OF AREAL FLOW IN MULTIAQUIFER GROUNDWATER SYSTEMS: A QUASI THREE-DIMENSIONAL MODEL,
Geological Survey, Washington, D. C.
J. D. Bredehoeft, and G. F. Pinder.
Water Resources Research, Vol 6, No 3, p 883-888, June 1970. 6 p, 5 fig, 11 ref.

Descriptors: *Groundwater movement, *Aquifers, *Mathematical models, Computer programs, Equations, Numerical analysis, Aquicludes, Leakage, Permeability, Artesian wells, Water storage, Water table.
Identifiers: Multiaquifer systems, Leaky artesian aquifers.

A general solution for the response of multiple aquifer systems to pumping stress requires solving the three-dimensional flow equations. The large number of arithmetic calculations and the excessive computer storage required for a numerical solution usually precludes solving the equations in three dimensions for typical hydrologic problems. When the hydrologic system is represented by aquifers in which flow is assumed horizontal, and confining layers in which flow is assumed vertical, the problem can be reduced to solving two-dimensional equations for each aquifer, the aquifers being coupled through leakage. An iterative scheme is used to solve simultaneously the finite difference equations describing the response of confined and unconfined aquifers with or without storage in the confining layer. FINGER IMBIBITION IN ARTIFICIAL REPLENISHMENT OF GROUNDWATER THROUGH CRACKED POROUS MEDIUM,
Maharaja Sayajirao Univ. of Baroda (India).
A. P. Verma.
Water Resources Research, Vol 6, No 3, p 906-911, June 1970. 6 p, 3 fig, 20 ref.

Descriptors: *Groundwater movement, *Injection wells, *Mathematical models, *Mixing, Saline water intrusion, Porous media, Fractures (Geology), Permeability, Immiscibility, Viscosity, Water properties, Wettability, Wetting.
Identifiers: Imbibition (Groundwater).

A theoretical model of groundwater replenishment in a cracked porous medium considers simultaneous occurrence of the phenomena of fingering and imbibition. Injection of water into other water bodies is initiated by imbibition, and the injected and native water form two immiscible liquid phases of different salinities with small viscosity difference. For the average behavior of fingering, the nonlinear differential equation is solved by a perturbation technique. An expression for the average cross-sectional area occupied by fingers was obtained. (Knapp-USGS)

GROUNDWATER DISCHARGE IN THE ILLINOIS BASIN AS SUGGESTED BY TEMPERATURE ANOMALIES,
Illinois State Geological Survey, Urbana.
Keros Cartwright.
Water Resources Research, Vol 6, No 3, p 912-918, June 1970. 7 p, 6 fig, 1 tab, 23 ref.

Descriptors: *Groundwater movement, *Discharge (Water), *Illinois, *Geothermal studies, Borehole geophysics, Heat flow, Temperature, Thermal conductivity, Recharge, Groundwater basins, Hydrologic budget, Fractures (Geology), Hydrogeology.
Identifiers: Illinois Basin.

Areas where groundwater in the illinois basin is moving vertically should be reflected by temperature anomalies. An isothermal map for a depth of 500 feet was constructed, based on bottom hole temperature of deep wells. This map was compared with a theoretical isothermal map for a depth of 500 feet that was made by projecting temperature gradients calculated from the thermal conductivities of the rock downward. The residual temperature map shows several warm and cool anomalies that are postulated to be discharge and recharge areas, respectively. Analysis of the curvature of the earth's thermal profile suggests that approximately 59,000 acre-feet of groundwater per year are discharged upward from the deep rocks in the Illinois basin. This figure is of the same magnitude as an estimated excessive groundwater discharge into the region's streams of 43,000 acre-feet. From a simplified model of the basin, a groundwater inflow of about 36,500 acre-feet from the surrounding highlands is estimated. A significant portion of discharge must be through fracture zones associated with faults and anticlines. One discharge area in southwestern Illinois is also suggested by field data. (Knapp-USGS)

ELECTROLYTIC MODEL STUDY FOR COLLECTOR WELLS UNDER RIVER BEDS,
New Mexico Inst of Mining and Technology, Socorro.
Bruce E. Debrine.
Water Resources Research, Vol 6, No 3, p 971-978, June 1970. 8 p, 7 fig, 11 ref.

Descriptors: *Induced infiltration, *Water yield, *Groundwater movement, *Surface-groundwater relationships, *Analog models, Alluvial channels, Discharge (Water), Flow, Model studies.
Identifiers: Electrolytic models.

Analytical solutions of flow to collector wells are based on the assumption of uniform flux distribution along the laterals. Although theoretically the head, and not the flux, should be uniform, these solutions have been claimed closely to approximate the drawdown in the collector well. To test the validity of this claim, the flow to a well with a single lateral, located under a river bed and along which the head is maintained uniform, is reproduced by an electrolytic model. The results of this model study agree rather well with the solutions of Hantush and Papadopulos, the relative deviation being about 2.2%. It is concluded that these solutions adequately describe the drawdown in a collector well. The study further suggests that the flow to a collector well can be treated, using the assumption of either uniform flux or uniform head along the laterals. (Knapp-USGS)

SUMMARY OF GROUNDWATER OCCURRENCE IN CALIFORNIA,
Geological Survey, Menlo Park, Calif.
Fred Kunkel.
U S Geological Survey Open-file report, March 17, 1970. 7 p, 1 map.

Descriptors: *Groundwater, *California, *Hydrogeology, *Reviews, Surveys, Aquifers, Water sources, Alluvium, Mapping, Maps, Hydrologic data, Water yield, Water quality, Geology.

In California most of the readily available groundwater that is pumped from wells occurs in Cenozoic nonmarine sedimentary rocks and alluvial deposits. These deposits fill most of the larger and many of the smaller structural basins. Brief statements are given to summarize groundwater occurrence for all the formations shown on the 'Geologic map of California.' (Knapp-USGS)

WATER-LEVEL AND WATER-QUALITY TRENDS IN AQUIFERS ALONG THE MISSISSIPPI GULF COAST, 1970,
Geological Survey, Jackson, Miss.
Donald E. Shattles, and James A. Callahan.
U S Geological Survey open-file report, July 1970. 19 p, 7 fig, 4 tab, 10 ref.

Descriptors: *Groundwater, *Aquifers, *Fresh water, *Mississippi, *Water-level fluctuations, Water quality, Hydrographs, Artesian wells, Confined water, Saline water intrusion.
Identifiers: Gulf coast, Water quality trend.

Artesian water levels along the Mississippi coast are declining 0.5 to 1.0 foot per year on the average; however, water levels are still above or only slightly below land surface in most places, and considerable additional drawdown is economically available. The groundwater is of good quality except in a few localities where the concentration of chloride exceeds 250 mg/liter. Of the 43 wells that were resampled during 1969, 18 showed a decrease in chloride, 18 showed an increase, and 7 indicated no change. (Lang-USGS)

COMMON ERRORS IN DEVELOPING A GROUNDWATER AQUIFER,
Geological Survey, Louisville, Ky. Water Resources Div.
D. V. Whitesides.
Groundwater, Vol 8, No 4, p 25-28, July-August 1970. 4 p, 8 fig.

Descriptors: *Water resources development, *Groundwater, *Kentucky, *Alluvial channels, *Surface-groundwater relationships, Conjuncti use, Induced infiltration, Ohio River, Aquife Groundwater movement, Planning, Water manag ment (Applied).
Identifiers: Groundwater development.

Some of the more common errors made in t development of groundwater supplies in the allu al aquifers along the Ohio River in Kentucky a discussed. Ample available literature on prop methods of development of the alluvial aquife generally seems to have been ignored by the wat users in the area. The more common errors made the typical developments are singled out for discu sion. In the typical development the aquifer treated as an inexhaustible underground rive Wells generally are clustered in small areas remo from the Ohio River, and are likely to be locat more for convenience and economy of pipeline property access than for hydrologic consideration It is hoped by highlighting these errors and showi alternative methods of development that prop development practices will be fostered. Stages the development of two hypothetical groundwat aquifers in the Ohio River valley are shown by eig illustrations that stress the common errors made development and alternative methods of develo ment taking into account hydrologic consider tions. PUMPING TESTS AND HYDROGEOLOGICAL INVESTIGATIONS OF AN ARTESIAN AQUIFER NEAR HORSENS, DENMARK,
Geological Survey of Denmark, Copenhagen.

..J. Andersen, and Z. Haman.
Nordic Hydrology, Vol 1, No 2, p 69-110, 1970. 42), 10 fig, 13 tab, 14 ref.

Descriptors: *Aquifers, *Glacial drift, *Confined water, *Theis equation, Clays, Sands, Unsteady flow, Artesian wells, Drawdown, Groundwater movement, Permeability, Transmissivity.
Identifiers: *Denmark, Jacobs equation, Aquifer testing.

In the Egebjerg area, near Horsens, Denmark several aquifers consist of glacial outwash material in a glacial buried valley in the Tertiary formation. The lowest of these, which is the main productive aquifer, and which has leaky artesian conditions, varies in thickness from 10-40 m. The lower confining bed consists of boulder clay or meltwater clay underlain by boulder clay. The upper confining bed, where leakage occurs, consists of meltwater clay with thickness from 0 to 5 m. The upper meltwater deposits include a sequence of interglacial lake deposits and several layers or laminae of clay, which separate this water-bearing material into more aquifers. The Theis modified non-equilibrium equation and its derived formula for the non-steady-state leaky artesian case were used to determine aquifer properties from pumping test data. By means of Jacob's method and a logarithmic method, well characteristics are determined graphically. Barometric efficiency, reverse fluctuations, and boundary conditions are recorded and discussed. (Knapp-USGS)

RECONNAISSANCE OF THE GROUNDWATER RESOURCES OF THE MISSOURI RIVER ALLUVIUM BETWEEN MIAMI AND KANSAS CITY, MISSOURI,
Geological Survey, Washington, D.C.
L. F. Emmett, and H. G. Jeffery.
For sale by US Geological Survey, Washington, DC - Price $0.50. US Geological Survey Hydrologic Investigations Atlas HA-344, 1 sheet, 1970. Text, 3 fig, 1 tab, 19 ref.

Descriptors: *Water resources, *Groundwater, *Alluvium, *Missouri River, *Missouri, Water wells, Aquifers, Water yield, Water quality, Water utilization, Water resources development.
Identifiers: Missouri River alluvium.

The purpose of this 1-sheet hydrologic atlas is to describe the thickness, areal extent, and lithology of the alluvial deposits along the Missouri River between Miami and Kansas City, Mo., and to provide information on the occurrence, availability, use, and chemical quality of the water contained in the alluvial aquifer. Flood-plain width varies from 2 to 10 miles and has a total surface area of approximately 440 square miles. Underlying the flood plain are clay, silt, sand, and gravel deposited by the river. The saturated sand and gravel, which is hydraulically connected with the river, constitutes a large and productive aquifer, which for the most part is presently underdeveloped. Eleven cities pump approximately 13.6 million gallons of water per day from the alluvial aquifer in this reach of the river. Industrial use of groundwater is confined to the Kansas City area and amounts to about 13 mgd (million gallons per day). A rough approximation of water used for irrigation is about 1.25 mgd; combined municiple, industrial, and irrigation use amounts to about 28 mgd; 85 percent of this is pumped from the alluvium between Kansas City and Independence. Irrigation wells in the area have reported pumping rates of around 1,000 gpm, and specific capacities ranging from 50 to 150 gpm per foot of drawdown. Water in alluvium in this reach of the valley is a calcium bicarbonate type, characterized by a high hardness and high iron content. (Knapp-USGS)

THE THREE-PHASE DOMAIN IN HYDROLOGY,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
C. H. M. van Bavel.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 23-32, 1968. 10 p, 19 ref.

Descriptors: *Unsaturated flow, *Saturated flow, *Porous media, *Groundwater movement, *Soil water movement, Permeability, Hydraulic conductivity, Porosity, Hydrogeology, Hydrology, Infiltration, Percolation, Discharge (Water), Recharge, Aquifers, Soils, Soil water, Groundwater.
Identifiers: *Multiphase flow (Porous media).

The importance of the unsaturated zone relative to the hydrologic cycle as a whole is considered. The domain of unsaturated water movement is distinguished as a 3-phase system in order to stress the point that its essential characteristics derive from a time-variant proportion of gas and liquid in a solid matrix. This proportion changes as infiltration alternates with drainage and redistribution of water and as recharge is offset by evaporation and transpiration. The water content of the matrix determines the mobility of the liquid phase and the direction and magnitude of the resultant driving forces acting per unit mass of water. Prediction of the behavior of unsaturated systems by either mathematical, numerical, modeling or analog methods is instructive but often too idealized. Practical progress must also lean heavily upon systematic observation of water content and water potential in the zone reaching from the surface to the domain of saturation and of maximum hydraulic conductivity. Many hydrological field studies are completely lacking in this respect. Yet, a number of important hydrologic processes, such as surface exaporation, surface or overland runoff, transpiration by vegetation, interflow and accretion by groundwater reservoirs, are significantly influenced by the physical disposition of the unsaturated zone toward water movement. From a combination of theory and measurement in this area, the behavior of hydrological systems with regard to water yields, stream flow characteristics, and transport and emergence of pollutants, ought to become better understood and more successfully controlled. (See also W70-09261). (Knapp-USGS)

GROUNDWATER BASIC DATA, PART 2 OF GEOLOGY AND GROUNDWATER RESOURCES OF MERCER AND OLIVER COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, N. Dak.
M. G. Croft.
North Dakota Geological Survey Bulletin 56 and North Dakota Water Commission Groundwater Studies 15, 1970. 268 p, 2 fig, 1 plate, 6 tab, 11 ref.

Descriptors: *Groundwater, *Water resources, *North Dakota, Data collections, Hydrologic data, Hydrogeology, Water wells, Water quality, Sampling, Springs, Water levels, Observation wells, Particle size, Aquifers.
Identifiers: Mercer County (ND), Oliver County (ND).

Data were collected to be used to: (1) determine the location, extent, and nature of the major aquifers of Mercer and Oliver Counties, North Dakota; (2) evaluate the occurrence and movement of groundwater, including the sources of recharge and discharge; (3) estimate the quantities of water stored in the aquifers; (4) estimate the potential yields to wells tapping to major aquifers; and (5) determine the chemical quality of the groundwater. The information in this report was collected chiefly between 1966 and 1969, and consists of the following: (1) Data on about 1,300 wells and test holes; (2) data on 9 springs; (3) water-level measurements in 29 observation wells; (4) logs of 299 test holes and selected wells; (5) chemical analyses of 160 water samples, and (6) 25 particle-size distribution curves. (Knapp-USGS)

TIDAL PHENOMENA IN THE KARSTIC WATER LEVEL,
Research Inst. for Water Resources Development, Budapest (Hungary).
L. Maucha, and I. Sarvary.
Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 39-45, June 1970. 7 p, 5 fig, 3 ref.

Descriptors: *Springs, *Karst, *Water level fluctuations, *Siphons, *Tides, Tidal effects, Discharge (Water), Water circulation, Water levels, Aquifers, Groundwater movement.
Identifiers: Earth tides.

In the north-eastern part of Hungary, in the vicinity of the Josvafo Karst Research Station, there are two karstic springs with siphonal discharge. On the basis of the periodicity of discharge, it can be assumed that water yield may be influenced by tidal phenomenon in the karstic water level. Systematic measurements and interpretations have proved the correctness of this assumption. The narrowing and widening of the conduits of the aquifers was measured simultaneously with spring strain gages. A close relationship was found to exist between the variation of gravity and the changes in the size of the openings. Information was obtained on tidal phenomena in the solid crust. The influence of the variation of the gravitation field can also be shown to have affected the yield of non-siphonal karstic springs. (Knapp-USGS)

ON THE SOLUTION OF INVERSE PROBLEMS IN HYDROGEOLOGY (FRENCH),
SCET/Cooperation--BCA, Puteaux (France).
A. Korganoff.
Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 67-78, June 1970. 12 p, 2 ref.

Descriptors: *Model studies, *Transmissivity, *Storage coefficient, *Aquifers, Groundwater movement, Mathematical models, Computer models, Networks, Mathematical studies, Systems analysis, Flow nets.
Identifiers: Inverse hydrologic problem.

The inverse problem consists of the determination of the transmissivity and the storage of an aquifer at every point of a net. The equations of the problem are generally undetermined and smoothing condi-

tions are usually introduced. Two other types of constraints are considered: knowledge of the transmissivity, and the storage of points and in regions of equal values. Several different solutions are given according to the relative importance of each constraint, and according to the selected norm. In the case of the Euclidean norm, solutions can be expressed very simply by means of pseudo-inverses. (Knapp-USGS)
W70-09371

ESTIMATING STORAGE CAPACITY IN DEEP ALLUVIUM BY GRAVITY-SEISMIC METHODS,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
D. E. Wallace, and D. P. Spangler.
French resume. Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 91-104, June 1970. 14 p, 9 fig, 2 tab, 13 ref.

Descriptors: *Water storage, *Alluvium, *Aquifers, *Seismic studies, *Gravity studies, Storage coefficient, Groundwater basins, Sedimentary basins (Geological), Exploration, Surveys, Investigations, Arizona, Water resources development.
Identifiers: Basin and Range region, Groundwater prospecting.

Large volumes of groundwater are contained in the deep intermontane valleys of Basin and Range regions. Determining the shape and storage capacity of these basins by drilling can be expensive and difficult because of the depth of alluvium and large areas involved. These difficulties can often be overcome by combining gravimetric and seismic refraction interpretations. The basin boundaries are determined by gravimetric methods, with bulk density samples taken of all representative formations. Density values can then be correlated with seismic velocities to estimate subsurface porosities. Seismic velocity varies inversely with porosity for the alluvial deposits. These values can be correlated with their respective formations in the basin from geologic sections derived from the seismic refraction survey. Thus, with volume and porosity of the alluvium known, storage capacity (both present and potential) can be computed. (Knapp-USGS)
W70-09373

DETERMINATION OF THE VELOCITY AND DIRECTION OF GROUNDWATER FLOW BY RADIOISOTOPES,
Middle Eastern Regional Radioisotope Center for the Arab Countries, Cairo (Egypt).
I. B. Hazzaa.
French resume. Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 11-15, June 1970. 5 p, 1 fig, 1 tab, 9 ref.

Descriptors: *Groundwater movement, *Tracers, *Tracking techniques, *Iodine radioisotopes, Observation wells, Sampling, Monitoring, Permeability, Velocity, Radioisotopes, Radioactivity techniques, Aquifers, Transmissivity, Porosity.
Identifiers: Groundwater tracers, Aquifer testing.

A tracer method was developed for determination of the velocity and direction of groundwater flow. Derived theoretical considerations together with model basin experiments verify this method. For this purpose, a pumped well and two piezometers were used. A proper quantity of the radioisotope I-131 was injected in the first piezometer and moved with groundwater flow. Pumping was started and the time of arrival of I-131 in the pumped water was recorded. The pumping rates, the aquifer dimensions and the effective porosity and can be calculated. (Knapp-USGS)

GROUNDWATER RECORDS OF SOUTH CAROLINA - 1966,
Geological Survey, Columbia, S.C.
G. W. Stock, Jr. and G. E. Siple.
South Carolina Division of Geology Miscellaneous Report No 5, 1969. 39 p, 8 fig, 2 tab, 9 ref.

Descriptors: *Hydrologic data, *Groundwater, *South Carolina, Water levels, Water quality, Aquifers, Observation wells, Water wells, Water level fluctuations, Water yield, Evapotranspiration, Data collections.
Identifiers: Groundwater data.

During 1966, water levels were monitored in 33 observation wells in the South Carolina Coastal Plain. Four record high and nine record low water levels were recorded during the period. In general, water levels in wells unaffected by pumping reached maximum stage during the winter or early spring months and declined during the summer as a result of high discharge because of evapotranspiration and decreased recharge. Although precipitation records showed greater than normal rainfall, some areas experienced below normal rainfall and a decline in water level in several observation wells during the latter part of the year, when normally these levels would have recovered to higher stages. Waters from the sand aquifers of Tertiary and Cretaceous age in the inner Coastal Plain are acidic, soft and have a low dissolved-solids content. As these waters move towards points of discharge in coastal areas they become alkaline and higher in bicarbonate and dissolved solids content and are characterized as a sodium bicarbonate type. Limestone waters were hard, slightly alkaline, and of a calcium bicarbonate type. Progressive saltwater encroachment was not detected in any of the principal aquifers. (Knapp-USGS)

dentifiers: *Anurans, Fossorial animals.

padefoot toads live in burrows in Southeastern rizona from September to the beginning of the ainy season in July. The burrows are not located andomly. Regardless of methods used, it was vir-ually impossible to locate them without first seeing he toads emerge. They first emerged in several esert grassland sites in early July following an ex-remely light rain without runoff. Twenty-two of hese animals were sacrificed, and only 2 had tomach contents. Of 16 animals captured after the irst heavy rainfall, 12 had stomach contents. It ap-ears that at least some individuals move to the sur-ace before the rains begin and are able to detect nvironmental cues, however slight. Although everal species were seen, only the burrows of S. ammondii were found, always in sand soil. Average burrow depths ranged from 24-42 cen-imeters, increasing from September to June. Soil moisture measurements and laboratory data indicated the toads can absorb soil moisture through their skin when soil moisture tension is as high as 10 atmospheres. As soil moisture tension increases through the winter, their osmotic pressures increases by metabolic urea production. Apparently skin water permeability is, paradoxically, the crucial adaptation to desert survival for these toads. (Casey-Arizona)

ON THE ADHESION OF PORE WATER IN FINNISH ARGILLACEOUS SEDIMENTS OF DIFFERENT AGE,
Helsinki Hydrological Office (Finland).
Jouko Soveri.
Nordic Hydrology, Vol 1, No 2, p 111-119, 1970. 9 p, 7 fig, 2 ref.

Descriptors: *Soil water, *Soil moisture, *Compaction, *Clays, Soil compaction, Capillary water, Pore pressure, Porosity, Hysteresis, Soil water movement, Retention, Consolidation, Soil mechanics, Soil engineering.
Identifiers: *Finland.

The conduct of pellicular water is influenced by adhesion forces in fine grain soils of different age and at different degrees of consolidation. Determinations were made by compression apparatus, by which it was possible to indicate the extrusion of pore water and the change of void ratio as well as the degree of consolidation of the natural state. During experiments the samples were subjected to loads of 0.25, 0.5, 1.0, 2.0, 4.0, 8.0, and 16.0 kg/sq cm. For proper performance of the process each load was left on for 24 hours. The measurement of one sample together with the decompression-recompression experiment required 12 days and nights. The adhesion of pellicular water in older samples of similar consolidation is stronger, and older samples retain comparatively more water. (Knapp-USGS)

FINITE ELEMENT METHOD OF ANALYZING STEADY SEEPAGE WITH A FREE SURFACE,
California Univ., Berkeley.
Shlomo P. Neuman, and Paul A. Witherspoon.
Water Resources Research, Vol 6, No 3, p 889-897, June 1970. 9 p, 8 fig, 25 ref.

Descriptors: *Seepage, *Groundwater movement, *Free surfaces, *Dams, *Mathematical models, Digital computers, Aquifers, Water table, Leakage, Percolation, Anisotropy, Porous media.
Identifiers: Finite element analysis.

A new iterative approach to steady seepage of groundwater with a free surface was developed using the finite element method. This approach eliminates a number of difficulties that were inherent in the iterative procedures previously used to solve this problem, and rapid convergence is now assured in all cases. The method is applicable to heterogeneous porous media with complex geometric boundaries and arbitrary degrees of anisotropy. It can handle problems where the free surface is discontinuous and where portions of the free surface are vertical or near vertical. In addition, infiltration or evapotranspiration at the free surface can be handled with ease. Several examples are included to demonstrate the power of this new approach and to show how it can apply to a wider variety of free surface problems than has been possible before. (Knapp-USGS)

A MOVING BOUNDARY MODEL OF A ONE-DIMENSIONAL SATURATED-UNSATURATED, TRANSIENT POROUS FLOW SYSTEM,
Stanford Univ., Calif.
George M. Hornberger, and Irwin Remson.
Water Resources Research, Vol 6, No 3, p 898-905, June 1970. 8 p, 9 fig, 15 ref.NSF Grant GK 4525.

Descriptors: *Groundwater movement, *Soil water movement, *Saturated flow, *Unsaturated flow, *Mathematical models, Unsteady flow, Porous media, Digital computers, Water level fluctuations, Infiltration, Recharge.
Identifiers: Finite difference analysis.

A moving boundary model is proposed for one-dimensional transient flow of water through a porous medium of which part is saturated and part is unsaturated. The model is based upon a theory that implies a discontinous propagation of pore pressure at the saturated-unsaturated interface. The moving boundary model is used to study a gravity drainage problem. Two numerical procedures are developed to solve the problem, an approximate Taylor series method and a finite difference method. The validity of the methods was appraised by comparing the results with experimental data. The Taylor series method is limited in applicability because of a need for accurate determination of derivatives of hydraulic conductivity and of moisture content respecting pressure head. The finite difference solution is very efficient because only changes in the unsaturated region are computed and the need for iteration is obviated. (Knapp-USGS)

HYSTERESIS IN TWO SANDS AND THE INDEPENDENT DOMAIN MODEL,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia).
T. Talsma.
Water Resources Research, Vol 6, No 3, p 964-970, June 1970. 7 p, 3 fig, 27 ref.

Descriptors: *Hysteresis, *Unsaturated flow, *Wetting, *Sands, Moisture content, Hydraulic conductivity, Potential flow, Hydraulics, Steady flow, Unsteady flow, Model studies, Hydraulic models, Capillary action.
Identifiers: Capillary hysteresis.

Hysteresis in the relations between moisture content, potential, and conductivity was measured on two sands, one fine grained and the other coarse and angular grained. Hydraulic conductivity was determined during steady flow at selected capillary potentials. Water uptake and release from the samples was measured volumetrically at equilibrium points using multistep increments of capillary potential. Sets of primary draining and wetting scanning curves were obtained for both sands. Anomalies existed in the total water release and uptake for both main branch and scanning curves of the coarse sand. Considerable hysteresis occurred in the moisture content-potential and conductivity-potential relationships but little, if any, hysteresis was observed in the moisture content-conductivity relationships. The independent domain theory of hysteresis predicted the scanning curves moderately well for the greater part of the hysteresis regions. Significant deviations were found in the high moisture content range in the fine grained sand. (Knapp-USGS)

HYDROPHYSICAL PROPERTIES AND MOISTURE REGIME IN THE UNSATURATED ZONE,
A. A. Rode.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 33-48, 1968. 16 p, 5 fig, 1 tab, 21 ref.

Descriptors: *Soil water, *Unsaturated flow, *Soil water movement, Percolation, Infiltration, Recharge, Hydrogeology, Water storage, Moisture tension, Retention, Zone of aeration, Vadose water.
Identifiers: *Soil moisture regime.

The unsaturated zone consists of the strata extending from the surface down to the upper aquifer. These strata are porous. Pores are small and changeable in size and shape. Particles surrounding pores are characterized by high values of the specific surface and surface energy. The surface energy and gravity determine the behavior of moisture in the unsaturated zone. The tension (effective value of the surface energy) depends on the moisture content, reaching a maximum for dry soil and dropping to zero in saturated soil. As the change of tension proceeds, some sudden changes in properties of the soil-moisture appear. Certain values of moisture content known as hydrophysical constants correspond to these sudden changes. They quantitatively characterize the hydrophysical properties of the unsaturated zone. Most important hydrophysical constants are as follows: total water-holding capacity, minimum retentive capacity, moisture of capillary bonds rupture, wilting point, and maximum adsorptive capacity. Moisture within each interval between constants has characteristic properties and thus presents various forms of soil moisture. In the unsaturated zone layers with different forms of moisture may be distinguished. These are hydrological horizons and combinations of them form soil-hydrological profiles. Different types of moisture regime arise as controlled by climate, topography, vegetation and hydrophysical properties of the unsaturated zone. (See also W70-09262). (Knapp-USGS)

French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 63-74, 1968. 12 p, 4 fig, 5 tab, 4 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture, *Calibrations, *On-site tests, Boreholes, Lysimeters, Soil moisture meters, Instrumentation, Moisture meters, Nuclear meters.
Identifiers: *Weighable lysimeters.

In a gently undulating loam deposit measurements with a neutron moisture meter yield good results in freshly drilled auger holes but poor results in old auger holes when no special precautions are taken. Possible explanation for the deviation of the results is: (1) along the access tube the tight fitting of the soil has been lost due to rain infiltration causing a widening of the hole and hence the geometry of the measurement has been lost, (2) along the access tube preferential drainage may occur so the soil in the immediate vicinity of the access tube is dryer than in the more remote parts of the soil layer. Depending on the climatological conditions at the beginning of a drying period, the neutron moisture will yield mostly values which are too low and at the beginning of a wetting period the results obtained will be too high when old auger holes are used. To avoid eventual water movement along the soil surface and digging up of the whole profile of a 10 ton weighable lysimeter was constructed with an aluminium access tube in the center to take moisture samples. The comparison of the results obtained with the neutron moisture meter when a whole moisture profile is assessed with those obtained with the lysimeter confirms the hypothesis of the preferential pathway along the access tube. MEASURING SOIL MOISTURE IN THE BRENIG CATCHMENT: PROBLEMS OF USING NEUTRON SCATTER EQUIPMENT IN SOIL WITH PEATY LAYERS,
The Water Research Association, Medmenham (England).
J. A. Cole, and M. J. Green.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 74-88, 1968. 15 p, 7 fig, 2 tab, 13 ref.

Descriptors: *Soil moisture, *Nuclear moisture meters, *Calibrations, Moisture meters, Soil moisture meters, Clays, Soils, Permeability, Hydrogeology, Instrumentation.
Identifiers: Neutron-scatter moisture meters, Brenig watershed (Wales).

The Brenig Catchment in North Wales has podzolic and gley soils formed from a shaley parent material in conditions of 1300 mm annual average precipitation. The top horizon of these soils is a peat layer 10 to 40 cm in depth. As part of a water balance study over the 2020 ha catchment area, soil moisture profiles are being measured with the NIS 356 neutron scatter equipment at 15 sites. The paper describes the selection of an appropriate calibration curve for each horizon of the soil, relating neutron count to soil moisture, with due allowance for soil density, and content of iron or organic hydrogen. The correction of field observations for interface effects is discussed on the basis of laboratory measurement of interfaces with various moisture contrasts. The combination of random and systematic errors of measurement is fully discussed. After consideration of the total change in moisture contents at each locality in the Brenig Catchment, between one date and another, the variance of these changes during 1965 is found to be greater than would be explained by the individual errors of measurement. Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Calibrations, Moisture content, Nuclear meters.
Identifiers: *Neutron moisture gage (Surface).

In soils, the top layer may generally be regarded as the horizon which has the greatest hydrologic activity. As border zone between atmosphere and earth it is naturally involved in hydrological processes such as runoff, infiltration and evapotranspiration. Fluctuations in the moisture content of the topsoil reflect not only the characteristics of these activities, but also the capabilities of the soil as medium. A neutron surface gage (model P21 d/M Gauge, Nuclear Chicago Corporation) has been calibrated to register the moisture content in soils to a depth of 10 cm. Intermittent moisture measurements have been made with a few hours to a few days time spacing. The fluctuations observed have been related to several factors such as soil texture and structure, exposure and weather conditions. Adequate means of expressing moisture characteristics of the topsoil have also been considered with the purpose of attaining hydrologic significance. The neutron surface gage has been found to be an excellent tool in these investigations because of its speed of measurement, non-destructiveness and reliability. (See also W70-09267). (Knapp-USGS)

A STUDY ON PRESSURE MEMBRANE PROPERTIES IN RELATION TO CAPILLARY CONDUCTIVITY MEASUREMENTS,
Deutsche Akademie der Landwirtschaftswissenchaften zu Berlin (East Germany).
E. Vetterlein.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 203-213, 1968. 11 p, 9 fig, 4 tab, 4 ref.

Descriptors: *Capillary conductivity, *Membrane processes, *Osmosis, *Measurement, *Calibrations, Permeability, Soil water movement, Saturated flow, Unsaturated flow, Pore pressure, Soil temperature, Viscosity.
Identifiers: Water flow-osmotic pressure relations.

Experiments on permeability properties of pressure membranes lead to the following conclusions: The decrease of permeability of pressure membranes together with pressure increase on one side of the membranes was proved to be a combined effect of the pressure distribution in the water of membrane pores and turbulent flow of water. Measurements of permeability of pressure membranes carried out with the double membrane method--the membranes being in contact with the unsaturated soil--are similar to values of membrane permeability measured under conditions of saturated water flow. The temperature coefficients of membrane permeability and of capillary conductivity of soil are nearly equal. Apparently they are a function of the variations of water viscosity with temperature. Altogether the results of measurements state the possibility of a simple correction of membranes impedance on capillary conductivity measurements by means of the double membrane method. Descriptors: *Soil water movement, *Diffusivity, *Measurement, *Instrumentation, Calibrations, Moisture stress, Pore pressure, Membrane processes, Osmosis, Capillary conductivity, Tensiometers, Nuclear moisture meters, Soil moisture meters, Permeameters.
Identifiers: Soil diffusivity.

Difficulties with outflow or inflow systems for measuring soil water diffusivity stem from several causes. (1) The diffusivity changes so rapidly with moisture content that even for small changes created by small pressure steps, the assumption of a constant diffusivity is untenable. The measured water content redistribution within the sample during outflow is not compatible with that calculated for a constant diffusivity value. Hence, the volumetric outflow curves can only be matched approximately--giving rise to large discrepancies. (2) The attendant errors introduced by using a porous plate are difficult to overcome. Even if its impedance were estimated with sufficient accuracy, the additional contact impedance between plate and soil would remain undefined and dependent upon both soil water content and flux. (3) Different moisture content versus soil water pressure relations for different rates of establishing a given pressure yield inconsistent results regardless of plate or contact impedance corrections. Accurate gamma absorption techniques are available for soil water pressure monitoring especially in the tensiometer range. Calculations of diffusivity would not hinge on an assumption regarding the nature of the diffusivity and the rate of volumetric outflow. (See also W70-09281) (Knapp-USGS)

French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 235-244, 1968. 10 p, 2 fig, 4 tab, 9 ref.

Descriptors: *Capillary conductivity, *On-site tests, *Instrumentation, *Tensiometers, Moisture stress, Moisture tension, Diffusivity, Membrane processes, Osmosis, Hydraulic conductivity.
Identifiers: In situ tensiometers.

An instrument for measuring capillary conductivity and diffusivity of soil in situ consists of a tensiometer with a cylindrical cup. The theory uses the analogy of heat conduction, in which a perfect conductor and the surrounding material are initially at different temperatures. It takes into account the influence of the hydraulic conductivity of the cup wall and the influence of an additional contact resistance which may sometimes exist. Suggestions are made for the design of the instrument and for reducing the nunber of observations. Simplification of interpretation is possible when the influence of the cup wall can be neglected and when an additional contact resistance does not occur. Experiments yielded capillary conductivity as well as diffusivity. (See also W70-09283) (Knapp-USGS)

French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 245-256, 1968. 12 p, 12 fig, 2 ref.

Descriptors: *Soil water movement, *Mathematical studies, Moisture tension, Moisture content, Capillary conductivity, Flow, Hydraulic gradient, Darcys law, Laboratory tests, Model studies, Pore pressure.
Identifiers: Soil water movements equations.

Differential equations for one-dimensional vertical and horizontal flow in the soil and the use of these equations for the determination of capillary conductivity and suction in relation to the soil moisture content are presented. Two conditions were used: (1) the continuity of water flux; (2) the equality between suction gradient in an elementary soil layer and the flow resistance in order to assure the increase in soil moisture content. The differential equations are functions of: variation in soil moisture content as a function of distance and time; capillary conductivity as a function of soil moisture content; suction as a function of soil moisture content. A verification of the proposed method is given with data from laboratory experiments. (See also W70-09284) (Knapp-USGS)

DIVERGENCES BETWEEN EXPERIMENTAL AND THEORETICAL VALUES OF CAPILLARY DIFFUSIVITY (FRENCH),
State Coll. of Agronomical Sciences, Gembloux (Belgium).
L. Sine, and A. Bentz.
In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 263-277, 1968. 15 p, 13 fig, 1 tab, 17 ref.

Descriptors: *Soil water movement, *Diffusivity, *Measurement, Calibrations, Moisture stress, Drying, Infiltrometers, Moisture tension, Model studies, Laboratory tests, Discharge (Water), Nuclear moisture meters, Permeameters, Membrane processes, Osmosis.
Identifiers: Soil diffusivity.

The systematic measurement of diffusivity at low tensions, using the method proposed by Gardner, results in the following deviations between theory and experiment: the flow through the porous plate might be higher than the value calculated from theory; the obtained value of the diffusivity is a function of the height of the sample; the discharge at the lower boundary of the sample does not at all correspond with the moistre profile predicted by theory. The development of the moisture profile in samples 15 cm height was observed, using gamma rays for the measurement of the moisture content. A deviation between theory and experiment also appeared to exist during a study of the moisture profile above a water table. The development of the moisture profile depends on the initial and boundary conditions. (See also W70 09286) (Knapp-USGS)

VERIFICATION OF THE GENERALIZED DARCY'S LAW AND DETERMINATION OF CAPILLARY CONDUCTIVITY AT THE BEGINNING OF HORIZONAL INFILTRATION (FRENCH),
Laboratories of Fluid Mechanics, Grenoble (France).
Georges Vachaud.
In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The

Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 277-294, 1968. 18 p, 7 fig, 3 tab, 9 ref.

Descriptors: *Soil water movement, *Darcys law, *Capillary conductivity, Moisture content, Hydraulic gradient, Mathematical studies, Flow, Porous media, Unsaturated flow, Nuclear moisture meters, Laboratory tests.
Identifiers: Soil moisture profiles.

By analysis of both the moisture profiles, obtained by gamma ray absorption during infiltration in a soil column, and the wetting branch of the capillary pressure curve, a method is suggested for checking the validity of the generalized Darcy's law and obtaining capillary conductivity. At any time, for each value of the moisture content, the flow velocity is computed from the moisture profiles by integration of the continuity equation. The capillary gradients are obtained by substituting capillary profiles to moisture profiles. Plotting, for a given moisture content, the corresponding values of velocity versus gradient, we establish that a linear relationship exists, satisfying Darcy's law. The slope is the value of the capillary conductivity. (See also W70-09287) (Knapp-USGS)

HYDROLOGICAL CONSTANTS OF PAMPEAN SOILS: BROWN PRAIRIE AND BLACK PRAIRIE,
Buenos Aires Univ., (Argentina). Dept. of Agricultural Climatology and Fenology, and Agroclimatology Programme of the Centro de Investigaciones Agricolas Alberto Boerger, La Estanzuela (Uruguay).
Juan J. Burgos, and Walter C. Corsi.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 295-305, 1968. 11 p, 1 fig, 9 tab, 9 ref.

Descriptors: *Soil moisture, *Soil properties, *Prairie soils, Statistical methods, Bulk density, Field capacity, Wilting point, Sampling, Laboratory tests, Soil-water-plant relationships.
Identifiers: *Pampean soils.

Methods used to determine the hydrological constants of pampean soils are reviewed. Data measured in black and brown prairie soils are compared. The procedures for the determination of bulk density and field capacity in pampean soil gave more reliable results with the less disturbed soil samples. For this reason field tests are recommended in preference to the laboratory test made. Field capacity values for brown and black prairie or pampean soils over pampean loess are relatively high as compared to normal contents of prairie soils. Contents for these soils can be estimated at approximately 400 mm in a depth of one m. The wilting coefficient for brown prairie and black prairie soils over pampean loess is slightly higher for black prairie soils and may be estimated at between 240 and 250 mm for a depth of one m. The number of samples used in previous tests and a statistical analysis of the results disclose that in six soil samples the precision of the average bulk density was 0.02 to 0.03 g/cc; in thirteen tests to determine field capacity, precision was 10 to 13 mm per m of depth and in three samples to test wilting point, precision was 6 to 7 for a depth of one m in 95% of the cases. We consider that procedures requiring less handling of the samples and an increase in the drainage period could alter the results reported. (See also W70-09288) (Knapp-USGS)

THE MICROHYDROLOGICAL CHARACTERIZATION OF SOILS,
Guelph Univ. (Ontario). Dept. of Soil Science.
D. E. Elrick.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 311-317, 1968. 7 p, 4 fig, 1 tab, 24 ref, append.

Descriptors: *Capillary conductivity, *Soil moisture, *Soil properties, *Classification, Moisture content, Moisture content, Moisture stress, Pore pressure, Laboratory tests, Hydraulic gradient, Soil water movement.
Identifiers: Microhydrological soil classification.

Within the limits of soil water diffusion theory, soils can be characterized with regard to their ability to transmit water by determining experimentally the relationships between soil water content and soil water pressure and between capillary conductivity and soil water content. A brief review of some methods and procedures that can be used to determine capillary conductivity and capillary diffusivity is presented. Data on the microhydrologic properties of a soil are presented and the effects of air-drying and sieving on these properties are discussed. (See also W70-09290) (Knapp-USGS)

EFFECTS OF SALTS AND ORGANIC MATERIALS ON THE HYDRAULIC CONDUCTIVITY OF THE SOILS,
National Taiwan Univ., Taipei. Dept. of Agricultural Chemistry.
Tsen-tuo Chen.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 317-323, 1968. 7 p, 2 fig, 3 tab, 3 ref.

Descriptors: *Hydraulic conductivity, *Soil chemistry, *Clays, *Organic matter, *Ions, Ion exchange, Colloids, Porosity, Percolation, Laterites, Peptides, Soil water movement.
Identifiers: *Latosols.

Effects of OH and Cl on the hydraulic conductivity of latosol clays treated with various amounts of Ca and Na were found greater than of the cations. It was concluded that OH peptized the sesquioxide bonds on collidal surfaces and subsequently caused the decrease in stability index and volume of pores with a diameter greater than 28.4 millimicrons and increased bulk density. All of these, consequently, reduced the hydraulic conductivity. The application of carbon and nitrogen sources, combined or separated, induced clogging or aggregation of the soil, depending on the relative rate of addition. These caused a tremendous change in hydraulic conductivities. For soils with low hydraulic conductivities, that the addition of organic materials with nitrogen increased hydraulic conductivity significantly at the end of five weeks percolation. For a soil with low hydraulic conductivity, the same treatment reduced hydraulic conductivity at the end of same period of percolation. Changes in pH, nitrogen and organic matter content and C/N before and after percolation were found insignificant. Importance of studying the changes in hydraulic conductivities caused by cultural practices or fertilization for plant growth is stressed. (See also W70-09291) (Knapp-USGS)
W70-09290

SOIL MOISTURE PRESSURE IN SOME CLIMATIC ZONES,
Institut Prikladnoi Geofiziki, Leningrad (USSR).
I. I. Sudnitsin.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 323-329, 1968. 7 p, 5 fig, 1 tab, 8 ref.

Descriptors: *Soil moisture, *Climatology, *Pore pressure, Thermodynamics, Soil chemistry, Water chemistry, Soil water movement, Tensiometers, Freezing, Soil types, Moisture tension, Laboratory tests, Soil-water-plant relationships.
Identifiers: Soil moisture hygroscopy.

Soil moisture pressure (or potential) is characteristic of its thermodynamic state, mobility and availability for plants. Tensiometric, cryoscopic and hygroscopic methods were used to measure the soil moisture percentage versus pressure relationships for some soils in moist, semiarid and arid zones of the European part of the USSR. At high soil moisture percentage the pressure depends on the soluble salt content, and at low soil moisture percentage it depends on the exchangeable ion distribution and the specific surface of the soil particles. During the warm season the soil moisture pressure in the aeration zone decreases regularly in the direction of north to south as the climate becomes more arid. Pressure dynamics is a good criterion for estimating soil moisture conditions in the aeration zone and in plant water supply. Pressure dynamics depends not only on the climate, but also on soil properties and vegetation, especially the depth of the root zone. (See also W70-09292). (Knapp-USGS)
W70-09291

AN EMPIRICAL EXPRESSION FOR THE DESORPTION CURVE,
Institute for Land and Water Management Research, Wageningen (Netherlands).
W. C. Visser.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 329-335, 1968. 7 p, 4 fig, 1 ref.

Descriptors: *Soil moisture, *Drying, *Laboratory tests, Mathematical models, Moisture stress, Moisture content, Soil water movement, Statistical methods, Regression analysis.
Identifiers: *Desorption curves.

An empirical formula for the desorption curve was devised and tested on a large number of undisturbed soil samples. The two graphical methods to assess the four parameters are discussed and an example of the solution of these unknown parameters is given. A mathematical expression was evolved to make available a check on the accuracy of separate moisture stress-moisture content observations. The further purpose was to be able to transpose such relations as those between moisture stress and moisture flow into relations between moisture content and moisture flow. (See also W70-09293). (Knapp-USGS)

NFRARED SPECTROPHOTOMETRIC STUDY F WET CLAY SOILS (FRENCH),
stitute of Hydrotechnical Research, Bucharest Romania).
. Arcan.
: Water in the Unsaturated Zone, Vol I, roceedings of the Wageningen Symposium, The etherlands, June 19-25, 1966, International As- ociation of Scientific Hydrology, Publication No 2, p 336-334, 1968. 9 p, 11 fig, 1 tab, 7 ref.

escriptors: *Soil structure, *Soil chemical pro- erties, *Retention, *Moisture content, *Labora- ory tests, Spectrophotometry, Plasticity, Leaching, n exchange, Adsorption, Clays.
lentifiers: Infrared spectrophotometry.

Vith the aid of infrared spectra the soil structure nd the reciprocal action of soil particles and water r various clay soils in Romania was studied. The udies were performed with soils having a natural oisture content or dried at various temperatures. n order to get a correlation between the results ob- ained from the analysis and the physical conduct f the wet soil, the limits of plasticity, the velocity f disintegration of the soil in water and cation ad- orption were determined. The study shows that it possible to determine directly with spec- rophotometry the way in which the water is held y the soil particles, the degree of orientation and he thickness of the water film on the soil particles. See also W70-09294). (Knapp-USGS)

NFLUENCE OF SOIL STRUCTURE ON INFIL- TRATION AND pF VALUES OF CHERNOZEM AND CHERNOZEMLIKE DARK MEADOW SOILS,
Novi Sad Univ. (Yugoslavia). Faculty of Agricul- ure.
N. Vucic.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 344-350, 1968. 7 p, 11 tab, 14 ref.

Descriptors: *Soil moisture, *Moisture content, *Soil structure, *Chernozems, Laboratory tests, Irrigation, Leaching, Soil chemistry, Soil chemical properties, Porosity, Soil water movement, Infiltration, Retention, Drying, Sampling.
Identifiers: *Yugoslavia.

There is a definite correlation between the mechanical composition of a soil and the infiltration rate for non-structured or insufficiently structured soils. It is also known that soil structure changes the relation to a great extent and increases the infiltration rate. In soils with the same mechanical and structural composition, the infiltration rate is influenced by the stability of the aggregates, a quality of the soil which has not been often considered from this viewpoint. In the irrigation district of Vojvodina (Yugoslavia) 2 soil types dominate; chernozems and chernozem-like soils. They are very similar, have nearly the same mechanical and structural composition, and only very small differences in porosity, but have unequal stability of the aggregates, which causes large differences in infiltration rate. The differences are not only in the initial intake rate, but also in the time coefficient, in Kostjakov's formula. Noting the changes in aggregate composition of soils under infiltration, the value of pF data determined for disturbed soil, or for aggregates which do not represent the aggregates in situ, is questionable. The greatest moisture content determined at 1/3 atm. tension, and the lowest at 15 atm., were found in chernozem samples composed of aggregates of less than 0.25 mm. In samples with fractions from 10 to 0.25 mm, however, no differences in moisture contents were found. These facts are of great importance in connection with those soils with large aggregates that fall apart during cultivation or irrigation practice. (See also W70-09295). (Knapp-USGS)
W70-09294

ANALYSIS OF SOME FACTORS AFFECTING THE WATER VAPOUR DIFFUSION IN SOILS,
Khartoum Univ. (Sudan).
M. Kutilek.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 350-360, 1968. 11 p, 11 fig, 19 ref.

Descriptors: *Soil water movement, *Diffusivity, Soil structure, Soil texture, Soil chemistry, Mathematical studies, Unsaturated flow, Mathematical models, Moisture content, Moisture tension, Drying, Evaporation.
Identifiers: *Soil diffusivity, Polyphase flow.

The diffusivity of water vapor is considered to be a general characteristic of soil moisture transport. Values of Dw were computed for various models of soils. It is concluded that two cases, different in principle, have to be distinguished when analyzing the diffusion of water vapor in soils. In heavy soils where surface active clay particles are predominant, water vapor diffusion is inucnenced by the change of geometrical parameters (e.g. porosity) to a relatively low extent, and the mineralogical composition becomes the principal factor affecting diffusion. A high content of strongly hygroscopic materials (e.g. montmorillonite) brings about the decrease of the diffusivity by about 100. The influence of exchangeable cations is reverse when compared with the influence on the flow of liquid water. The bivalent exchangeable cations lower the diffusivity and the monovalent exchangeable cations raise the diffusivity, omitting the possible change of aggregation. In light soils where silt and sand particles are prdominant, since surface properties of these particles are uniform, the water vapor diffusion is affected primarily by the change of the geometrical parameters (porosity). The range of the changes is relatively small when compared with the changes caused by mineralogical composition of the heavy soils. (See also W70-09296). (Knapp-USGS)
W70-09295

MOISTURE CONTENT AND HYDROPHILITY AS RELATED TO THE WATER CAPILLARY RISE IN SOILS,
S. A. Wladitchensky.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 360-365, 1968. 6 p, 2 fig, 5 tab, 7 ref.

Descriptors: *Soil water movement, *Capillary conductivity, *Adsorption, *Capillary action, Unsaturated flow, Capillary fringe, Capillary water, Wetting, Pore pressure, Moisture content, Mathematical studies, Laboratory tests, Soil chemical properties.
Identifiers: Capillary rise (Soil water).

Because the limits of variation of soil properties are rather wide, an exhaustive description of capillary rise should be studied by expanding from studies of a single pore, to a system of pores, and at last to the soil as a whole. The uneven shape of the capillary rise curve is explained by differences in the dimension and shape of pores through which the water moves, and by differences in the character of pore walls. In particular the components of the soil have different hydrophility, and hydrophility of pore walls material is also influenced by adsorbed water and gas. The cosine of the wetting angle and the velocity of the capillary rise are a minimum at the hygroscopical moisture content. A series of experiments was carried out with water uptake by sand coated with humic acid. Humic acid reduces the hydrophility of sand particles and the velocities of water uptake. (See also W70-09297). (Knapp-USGS)

W70-09297

THE RELATION BETWEEN PARTICLE SIZE, PORE SIZE AND HYDRAULIC CONDUCTIVITY OF SAND SEPARATES,
Institute for Land and Water Management Research, Wageningen (Netherlands).
W. P. Stakman.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 373-384, 1968. 12 p, 6 fig, 2 tab, 14 ref.

Descriptors: *Porosity, *Porous media, *Sands, *Laboratory tests, *Instrumentation, Bubbles, Permeability, Permeameters, Tensiometers, Groundwater movement, Soil water movement, Unsaturated flow, Surface tension, Wetting, Capillary action, Pore pressure, Hydraulic gradient, Pressure.
Identifiers: *Pore size, Pore size determination, Air-bubble permeameters.

From the air bubbling pressure of sand separates the equivalent diameter of the largest bottle-neck in the capillary system can be calculated. The measured hydraulic conductivity of the sand separates is nearly directly proportional to the square of that diameter as well as to the square of the mean particle diameter. The measured results are compared with the hydraulic conductivity calculated with the Kozeny-Carman equation, based on laminar flow through a circular straight tube and with the Brinkman formula, based on the drag theory of permeability. W70-09298

REDISTRIBUTION OF MOISTURE AFTER INFILTRATION IN DRY SOILS. INFLUENCE OF GRAVITY,
Institut National de la Recherche Agronomique, Versailles (France). Soils Lab.
A. Feodoroff.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 385-389, 1968. 5 p, 2 figs, 1 tab, 6 ref.

Descriptors: *Wetting, *Soil water movement, *Percolation, Unsaturated flow, Infiltration, Drainage, Capillary action, Laboratory tests, Infiltrometers.
Identifiers: *Water redistribution.

The redistribution of water in soil after infiltration was studied by irrigating small (30 cm high and 3 cm diameter) soil columns by applying water at the tops. After infiltration, columns were sliced lengthwise immediately and after 24 hours. Others were inverted after 24 hours and examined after 24 more hours of standing inverted. The soils studied were a clay-loam, a silty clay loam, and a coarse sand. Gravity appears to have no great influence on water redistribution. It is concluded that the principal redistributive force is the attraction of dry soil in the wetting zone. (See also W70-09300). (Knapp-USGS)

INFILTRATION RATE AS RELATED TO HYDRAULIC CONDUCTIVITY, MOISTURE DEFICIT AND OTHER SOIL PROPERTIES,
Central Inst. for Agricultural Research, Bucharest (Romania). Soil Physics Lab.
A. Canarache, E. Motoc, and R. Dumitriu.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 392-401, 1968. 10 p, 5 fig, 3 tab, 29 ref.

Descriptors: *Infiltration, *Hydraulic conductivity, *Moisture deficit, *Soil properties, Unsaturated flow, Soil texture, Soil types, Soil profiles, Infiltrometers, Lysimeters, On-site tests, Laboratory tests, Sampling, Bulk density, Pore pressure.
Identifiers: Antecedent moisture content.

Correlation and regression analyses using data for some 150 soil profiles of different genetical and textural types were performed. Soil properties involved in the calculations were infiltration rate, clay content, porosity, hydraulic conductivity and moisture status. Water infiltration into the soil takes place through the non capillary pore space being directly proportional to its volume; positive correlations exist between infiltration rate and percent of water-free pores at field capacity (r = +0.364 and +0.541), as well as betwwen infiltration rate and log hydraulic conductivity (r = +0.520 and +0.509). At the same time, water penetrating into the soil encounters a resistance provided by the air compressed within pores ranging in size from those filled at field capacity to those filled at moisture content at the beginning of the determination. As such, infiltration rate is inversely proportional to the volume of these pores and negative correlations exist between infiltration rate and the moisture deficit (r = -0.240 and -0.216). No correlations were observed between infiltration rate and moisture content at the beginning of the determination or between infiltration rate and the total percent of water-free pores at that time. The multiple correlation coefficients involving infiltration rate, non capillary porosity and moisture deficit (R = 0.446 and 0.638) or infiltration rate, log hydraulic conductivity and moisture deficit (R = 0.610 and 0.548) were higher. W70-09300

INFILTRATION IN TERMS OF SOIL MOISTURE, RAIN INTENSITY AND DEPTH OF RAINFALL,
Hungarian Univ. of Agricultural Sciences, Godollo (Hungary).
K. Sagi.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 390-392, 1968. 3 p, 2 tab.

Descriptors: *Infiltration, *Soil water movement, *Rainfall, Penetration, Rainfall intensity, Rainfall-runoff relationships, Percolation, Retention, Soil moisture, Soil properties, Unsaturated flow.
Identifiers: Rainfall depth-infiltration relationships.

Infiltration into the soil from summer rains was determined on levelled plots of meadow clay soil, 154 by 21.5 m in area, under agricultural cultivation. A close relationship was demonstrated between rain intensity, amount of rainfall, and initial soil moisture on the one hand and infiltration on the other. On the basis of the relationship determined, probable values of infiltration are compiled in tables. (See also W70-09302). (Knapp-USGS)

THE NATURE OF THE MINIMAL WATER RETENTIVE CAPACITY,
Vsesoyuznaya Akademiya Selskokhozyaistvennykh Nauk, Moscow (USSR).
A. A. Rode.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 407-415, 1968. 9 p, 1 fig, 3 tab, 32 ref.

Descriptors: *Retention, *Field capacity, *Capillary water, Soil water, Water storage, Capillary action, Diffusion, Soil water movement, Soil temperature, Hydraulic gradient, Moisture tension.
Identifiers: *Soil water retention.

A soil uniform in texture is able to retain some water in equilibrium against gravity, providing that neither temperature nor tension gradients are effective. Such soil water is referred to as suspended moisture. The intrinsic minimal retentive capacity corresponds to maximal content of suspended moisture. The tension gradient does not operate after the solum has wetted through, and all gravitational water has moved out. If at some depth there is a dry layer with a moisture content less than minimal retentive capacity, the tension gradient arises, directed upwards from that layer. As influenced by this gradient, the suspended moisture starts moving very slowly towards the layer mentioned. This moisture is in a quasi-equilibrium state. The temperature gradient being effective and the moisture content being equal to the minimal retentive capacity, water movement as vapor opposing this gradient takes place. Losses of moisture as vapor are balanced by liquid water movement in the opposite direction. The moisture content tends to remain equal to minimal retentive capacity. The tension which corresponds to minimal retentive capacity varies considerably in soils of different texture, structures and consistence and can never become the same in soils of different characteristics. When expressed in cm of water, it equals numerically the maximal height of capillary rise. (See also W70-09303). (Knapp-USGS)

THE MOVEMENT OF WATER IN SANDY SOILS AFTER PLOUGHING AT A DEPTH OF 50 CENTIMETERS,
Bayerische Landesanstalt fur Bodenkultur, Pflanzenbau und Pflanzenschutz, Munich (West Germany).
Rid Heinrich.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 401-406, 1968. 6 p, 9 fig, 3 tab, 5 ref.

Descriptors: *Infiltration, *Soil structure, *Soil management, Permeability, Organic matter, Soil treatment, Deep tillage, Penetration, Percolation, Pervious soils, Sands, Clays, Seepage.
Identifiers: Soil infiltration capacity improvement.

An attempt was made to improve the water capacity of two sandy soils with different clay proportions by plowing in organic matter to a depth of 50 cm. This succeeded on the sandy soil while on the slightly clayey sand, during the course of the experiments, the same water contents were always measured on deep plowed as on normally plowed plots. The texture of the soil therefore may indicate the success of deep plowing. The importance of humus and the manner of working in the humus on sandy soils is emphasized. A tendency of enrichment of the nutrients in plowed under humus layers is indicated. (See also W70-09304). (Knapp-USGS)
W70-09303

A STUDY OF REDISTRIBUTION AFTER THE FINISH OF HORIZONTAL INFILTRATION (FRENCH),
Georges Vachuad.
In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 415-428, 1968. 14 p, 8 fig, 1 tab, 9 ref.

Descriptors: *Soil water movement, *Percolation, *Drainage, Unsaturated flow, Infiltration, Permeability, Hysteresis, Nuclear moisture meters, Capillary action, Capillary water.
Identifiers: *Soil moisture redistribution.

The evolution of the moisture profiles, after the end of an infiltration in an horizontal soil column, was followed by gamma-ray absorption. During the redistribution, it appears that there exist three different zones in the column, depending on the distance to the origin. In the first zone, near the surface, the flow is a uniform drainage; in the second one, a wetting process followed by a drainage; i the third one, the flow is a uniform wetting, at lea for the limits of time and length choosen. Usin both drainage and wetting branches of the capillar pressure curves, and analyzing the limit betwee the wetting and drainage flows in the column, method is suggested for computing the capillar pressure inside the hysteresis loop for each point o the column and at any time during the redistribu tion. (See also W70-09305). (Knapp-USGS)

ANALYSIS OF INFILTRATION INTO STRATIFIED SOIL COLUMNS,
Agricultural Research Service, Urbana, Ill.; and Illinois Univ., Urbana. Agricultural Experiment Station.
F. D. Whisler, and A. Klute.
French resume. In: Water in the Unsaturated Zone Vol I, Proceedings of the Wageningen Symposium The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 451-470, 1968. 20 p, 24 fig, 12 ref. USDA Contract No 12-14-100-5742 (41).

Descriptors: *Infiltration, *Soil water movement, *Stratification, *Laboratory tests, *Mathematical models, Percolation, Equations, Unsaturated flow, Saturated flow, Hysteresis, Hydraulic gradient, Permeability, Hydraulic conductivity, Moisture content.
Identifiers: *Stratified soils.

A numerical solution of the flow equation for water in soil was obtained for a flow system consisting of a vertical column of stratified soil materials which had been drained from saturation to equilibrium with a water table. Water was assumed to be applied at the top of the column as either rainfall or ponded water. Infiltration into such a system involves hysteresis; the soil at each point wets along a different wetting scanning curve. The solution of the equation depicts the time and depth distributions of water content and pressure head during the resulting infiltration as well as infiltration rate and accumulated water content. The properties of the soil that influence the flow are the water capacity and hydraulic conductivity. Several hypothetical cases included coarse-textured soils overlying fine-textured soils, fine-textured lenses in coarse-textured soils, and coarse-textured lenses in fine-textured soils. Comparisons were made between these cases and also nonstratified cases on the basis of pressure head-time profiles, moisture content-time profiles, infiltration rate changes, and accumulated water content changes. The numerical solution predicts a hold-up effect on the wetting front as it goes from a fine-textured layer into a coarse-textured one. The rate of advance of the fronts is faster for ponded infiltration than for rainfall infiltration. (See also W70-03907). (Knapp-USGS)
W70-09306

A LINEARIZATION TECHNIQUE FOR THE STUDY OF INFILTRATION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
J. R. Philip.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 471-478, 1968. 8 p, 2 fig, 20 ref.

Descriptors: *Infiltration, *Soil water movement, *Mathematical studies, *Digital computers, Linear programming, Equations, Hydraulic conductivity, Hydraulic gradient, Soil moisture, Moisture content.
Identifiers: Delta function, Linearization techniques.

A linearization technique is given for the solution of non-linear problems in infiltration and other problems of water movement in unsaturated soils. The method consists, essentially, in matching exactly linear and non-linear solutions at small times, and in matching the solutions in some integral sense at large times. The method is worked out for one-dimensional infiltration. It is shown to yield results agreeing closely with the 'exact' non-linear solution and to provide algebraic infiltration equations equally valid for small and large times. The parallel use of similarity (or better, delta function) solutions provides a good method of approximate analysis, since the linear and the delta function solutions represent extremes of soil characteristics and, by implication, of hydrological behavior. We may, therefore, obtain insight into the general character of the phenomenon and the extent to which it may vary, and we may obtain, at the same time, an indication of the accuracy of the results. For one-dimensional infiltration, the similarity (or delta function) solution agrees well with the linear solution. (See also W70-09308). (Knapp-USGS)
W70-09307

SOLUTIONS OF THE NON-LINEAR DIFFUSION EQUATION WITH A GRAVITY TERM IN HYDROLOGY,
Technion - Israel Inst. of Tech., Haifa; and California Univ., Berkeley.
S. Irmay.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 478-499, 1968. 22 p, 4 fig, 1 tab, 32 ref, 2 append.

Descriptors: *Soil water movement, *Diffusion, *Mathematical studies, *Equations, Digital computers, Saturated flow, Unsaturated flow, Steady flow, Unsteady flow, Evaporation, Infiltration, Water level fluctuations, Groundwater movement, Aquifers, Capillary action, Capillary water.
Identifiers: Soil water movement equations.

The partial differential equation of unsaturated flow of liquids in porous media, especially of water in stable soils, is discussed: steady and unsteady flows, with or without gravity, in one-, two-, and three dimensional cases, in cartesian and cylindrical coordinates. The initial and boundary conditions are described, and the hodograph sphere (circle) method of saturated flow is extended to unsaturated media. A number of steady flow solutions are studied analytically and graphically. In unsteady flows the equations are transformed into an ordinary differential equation by the Boltzmann transformation, by a linear wave-like transformation, by similarity transformations, by separation of variables, and by other methods. The method outlined can be used in solving similar diffusion equations in other fields. (See also W70-09309). (Knapp-USGS)
W70-09308

SOME NUMERICAL METHODS FOR SOLVING PROBLEMS OF NON-STEADY SEEPAGE IN NON-HOMOGENEOUS ANISOTROPIC SOILS,
All-Union Scientific and Research Inst. of Hydrotechnics and Reclamation (USSR).
L. N. Burejev, and Z. M. Burejeva.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 500-503, 1968. 4 p.

Descriptors: *Soil water movement, *Unsteady flow, *Seepage, *Anisotropy, *Computer programs, Mathematical studies, Digital computers, Numerical analysis, Mathematical models, Flow, Porous media, Unsaturated flow, Laplaces equation.
Identifiers: *Unsteady seepage.

A proposed method of computation of non-steady seepage consists of successive series of cycles each of which includes two stages of computation: the determination of components of speeds on a boundary and the determination of the new position of a boundary. The method makes it possible to construct an algorithm which is independent of the specific problem. This algorithm is used as a basis of the program for the BESM computer. (See also W70-09310). (Knapp-USGS)

ABSORPTION AND INFILTRATION IN TWO- AND THREE-DIMENSIONAL SYSTEMS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
J. R. Philip.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 503-525, 1968. 23 p, 7 fig, 18 refs.

Descriptors: *Infiltration, *Absorption, *Soil water movement, *Mathematical studies, Wetting, Capillary action, Percolation, Moisture content, Unsaturated flow, Steady flow, Unsteady flow.
Identifiers: Soil moisture profiles.

The theory of the dynamics of one-dimensional infiltration is well developed, but many practical problems involve two- and three-dimensional systems. The two-dimensional problem of infiltration from a semi-circular furrow and the three-dimensional problem of infiltration from a hemispherical cavity are examined. Exact series solutions of non-linear absorption problems are found which are appropriate for small times. For the three-dimensional case a steady large-time solution exists, and is evaluated. The corresponding linear and delta function solutions are also found; they agree well with the exact solutions. These various results support the argument that previous attempts to apply the Boltzmann transformation to this group of problems have been erroneous. The corresponding infiltration problems are formulated and the linear solutions developed. It is shown that: (1) the wetting region for both two- and three-dimensions is finite no matter how great the time (unlike for one dimension); and (2) the final steady state infiltration rate depends not only on the hydraulic conductivity, but also on the capillary properties of the soil. The influence of gravity in distorting the pattern of wetting decreases as the radius of the cavity or furrow decreases; and it is very much less in three dimensions than in two. (See also W70-09260). (Knapp-USGS)
W70-09310

INFILTRATION PROPERTIES OF THE SOILS OF THE CENTRAL CHERNOZEM PROVINCES,
A. M. Grin, and G. V. Nazarov.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic, US Agricultural Research Service, p 76-106, 1967. 31 p, 4 fig, 13 tab, 14 ref.

Descriptors: *Soil physical properties, *Soil properties, *Chernozems, *Infiltration, *Soil water, Absorption, Water balance, Analytical techniques, Forests, Vegetation effects, Geology, Land use, Permeability.
Identifiers: *USSR, Chernozem Provinces.

Infiltration properties of virgin land, cultivated land, forest and forest belt of the Chernozem region of the USSR were experimentally investigated. Chernozem soils have the highest infiltration capacity of the region and light-gray forest soils have the lowest. The greatest beneficial effect on infiltration is exerted by the forest and vegetation cover of virgin land areas. Grazing by cattle greatly impairs the infiltration properties of the soils both on cultivated land and in the forest. Forest belts exert a considerable beneficial influence on the soil by increasing its infiltration capacity. (See also W70-09312) (Gabriel-USGS)
W70-09313

AN APPROXIMATE METHOD FOR DETERMINING THE HYDRAULIC CONDUCTIVITY FUNCTION OF UNSATURATED SOIL,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
R. W. Skaggs, E. J. Monke, and L. F. Huggins.
Available from NTIS as PB-193 673, $3.00 in paper copy, $0.65 in microfiche. OWRR Project A-010-IND (6).

Descriptors: *Hydraulic conductivity, *Soil physical properties, Water properties, *Unsaturated flow, Non-saturated flow, *Pressure head, *Infiltration, Soil moisture, Soil water movement, Water content.
Identifiers: Richard's equation, Soil moisture characteristic.

A method is proposed for determining the hydraulic conductivity function of unsaturated soil. The method is based on the assumption that the conductivity-pressure head relationship, K (h), can be effectively represented by an empirical three-parameter equation. Procedure are given for evaluating the equation parameters from measurements of the soil-water characteristic, the saturated conductivity, and the infiltration rate-time relationship for an initially dry soil. Repeated numerical solutions to the Richard's equation for the movement in unsaturated soil are used with a search procedure to determine the parameter values giving the minimum difference between measured and calculated infiltration rate-time relationships. Computer programs, written in FORTRAN, were developed to apply and evaluate the method. An evaluation of the proposed method using soil property data obtained from the literature showed that a good approximation of the conductivity data could be obtained for soils in which the conductivity function had the general form of the assumed relationship. For soils having other forms of K (h), the functions obtained still allowed accurate predictions of the infiltration rate-time relationship for a wide range of initial water contents.

THE EFFECT OF TEMPERATURE ON WATER FLOW IN SOILS,
Mississippi State Univ., State College. Water Resources Research Inst.
R. D. Jensen, M. Haridasan, and G. S. Rahi.
Available from NTIS as PB-193 676, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Water Resources Research Institute, June, 1970. 43 p, 2 tab, 9 fig, 40 ref. OWRR Project B-002-MISS (1).

Descriptors: *Hydraulic conductivity, Pressure head, *Soil water movement, *Diffusivity, Soil moisture, *Temperature, Soil temperature, Thermal conductivity, *Conductivity.
Identifiers: Flux equations.

The dependence of the hydraulic conductivity of soil, the pressure head of soil water, and the soil water diffusivity on temperature, was investigated to determine the possible influence of temperature on water flow in soils. The hydraulic conductivity was found to be a function primarily of the soil water content. The effect of temperature on conductivity as a function of pressure head resulted primarily from the influence of temperature on the water content. At 35C the conductivity was larger at saturation, the soil drained at a larger pressure head, and the conductivity decreased at a faster rate than at 15C. Near saturation, when the water contents at the two temperatures were nearly the same, the increase in conductivity associated with rise in temperature can be explained by the effects of temperature on the viscosity of water. The pressure head as a function of water content increased as the temperature increased. This increase can be accounted for by the temperature dependence of the surface tension of air-water interfaces. The amount of water held by the soil at any given pressure head decreased with a rise in temperature. The effect of temperature on the diffusivity as a function of water content and pressure head was not significant except near saturation. The temperature dependence of the viscosity of water is sufficient to account for these effects. Techniques to resaturate a soil column, which avoided the difficulties caused by hysteresis, were developed so that repeated measurements of all the desired parameters could be made on the same sample of soil. Flux equations with measurable parameters which seem to adequately describe the flow of water and heat under nonisothermal conditions were presented.
W70-09345

EVALUATION OF SOIL MOISTURE MEASUREMENTS IN OKLAHOMA AS SOIL CHARACTERISTICS FOR CLASSIFICATION,
Agricultural Research Service, Stillwater, Okla.; and Oklahoma State Univ., Stillwater. Dept. of Agronomy.
J. D. Nichols, and J. F. Stone.
Soil Science Society of America Proceedings, Vol 34, No 4, p 638-641, July-August 1970. 4 p, 2 fig, 1 tab, 11 ref.

Descriptors: *Soil moisture, *Soil moisture meters, *Nuclear moisture meters, *Soil classifications, Instrumentation, On-site tests, Soil analysis, Soil investigations, Soil science, Soil types, Drying, Evaporation, Oklahoma.
Identifiers: Neutron moisture meters.

Soil moisture measurments were evaluated as soil moisture characteristics specified in the new soil classification system. Soil moisture measurements were made with a neutron probe at about weekly intervals and were available for 3 to 6-year periods at four sites with a range in mean annual precipitation of 45 cm to 80 cm. The cumulative days were counted when the soil moisture was below minus 15 atm pressure in either or both of the 0 to 23-cm increment and the 23 to 38-cm increment. The count was also made for the control section of the 23 to 38-cm increment and the 38 to 53-cm increment. The data yielded close fitting linear regression lines for cumulative days dry in each year against the measured precipitation for that year. The regression lines for the two tested control sections were nearly alike. The neutron probe method seems to be a satisfactory method for determining days dry. Some adjustment of the data may be necessary in translating the data for use in the classification system. (Knapp-USGS)
W70-09377

INFLUENCE OF RAINFALL ENERGY ON SOIL LOSS AND INFILTRATION RATES: 2. effect of clod size distribution,
Agricultural Research Service, Ames, Iowa; and Iowa State University, Ames.
W. C. Moldenhauer.
Soil Science Society of America Proceedings, Vol 34, No 4, p 673-677, July-August 1970. 5 p, 7 tab, 15 ref

Descriptors: *Soil erosion, *Runoff, *Rainfall-runoff relationships, *Impact (Rainfall), Laboratory tests, Model studies, Simulated rainfall, Raindrops, Soil structure, Soil physical properties.
Identifiers: Soil clod failure, Clods.

Various cold size distributions were subjected to drop impact from a water drop applicator that delivered only 5-mm drops. Increasing the maximum clod size from 20 to 40 mm did not delay the time for runoff to begin on four silt loam to silty clay textured Iowa soil samples taken from continuous-corn plots. Removing the clods smaller than 2 mm from the smaller than 40-mm sample had little effect on the time to runoff on continuous-corn soils, but did increase the time to initial runoff on the silt loam soil from meadow. Removing the fraction smaller than 8 mm from the smaller than 40-mm sample significantly increased the rainfall energy required to initiate runoff in all instances tested. Removing the fraction smaller than 30-mm from the smaller than 40-mm sample nearly doubled the energy to initial runoff. However, clod beds of this 30- to 40-mm size range from continuous corn did not withstand 0.18 joules per sq cm of rainfall energy, which commonly occur in western Iowa during the critical erosion period. Clod beds of the 30- to 40-mm size range from continuous meadow, in contrast to clod beds from corn land, did withstand 0.18 joules per sq cm of rainfall energy. (Knapp-USGS)
W70-09378

SOIL TEMPERATURE AND WATER CONTENT CHANGES DURING DRYING AS INFLUENCED BY CRACKS: A LABORATORY EXPERIMENT,
Iowa State Univ., Ames.
H. M Selim, and Don Kirkham.
Soil Science Society of America Proceedings, Vol 34, No 4, p 565-569, July-August 1970. 5 p, 6 fig, 2 tab, 7 ref. OWRR Project A-026-IA.

Descriptors: *Evaporation, *Soil water, *Expansive soils, *Cracks, Drying, Unsaturated flow, Soil water movement, Winds, Soil temperature, Soil structure, Soil physical properties, Laboratory tests.
Identifiers: Soil shrinkage cracks.

A container consisting of three identical compartments each 30 cm long, 30 cm deep, and 10 cm wide, was used to study the influence of artificial soil shrinkage cracks on heat and water content redistribution in three soil materials subjected to wind or radiative drying at 1.18 and 2.54 cm of water per 24 hours. Crack widths of 0, 0.64, and 1.91 cm were tested. Moisture content and temperature distributions were measured with time up to 12 days. The cracks decreased water content as much as 5 to 10% by volume. Evaporation through crack walls caused lateral movement of water for a distance of 4 to 5 cm from the wall of a 0.64-cm crack after 12 days of radiative drying. These distances were greater up to 14 cm in sand. Under wind, distances of lateral movement of water were about 5 cm for all drying times. In all three soils with cracks, after 4 days of wind drying soil temperature was cooler (1 to 2C lower) than for the soils with no cracks. Under radiation all three soils were warmer (5 to 10C higher) than soils with no cracks, after 4 days. In general, shrinkage cracks increased evaporation from bare soil 12-16% with cracks 0.64 cm wide and about 30% with cracks 1.91 cm wide as compared to evaporation from soils with no cracks. (Knapp-USGS)
W70-09379

FREEZING AND THAWING EFFECTS ON DRAINAGE,
Agricultural Research Service, Burlington, Vt. Soil and Water Conservation Research Div.
G. R. Benoit, and J. Bornstein.
Soil Science Society of America Proceedings, Vol 34, No 4, p 551-557, July-August 1970. 7 p, 7 fig, 6 tab, 22 ref.

Descriptors: *Soil water movement, *Frost, *Frozen soils, *Freezing, *Thawing, Melting, Percolation, Infiltration, Drainage, Soil structure, Soil physical properties, Particle size, Clays, Soil texture, Laboratory tests.
Identifiers: Soil water-frost relationships.

Laboratory studies were conducted on insulated models containing coarse sand (1-2 mm), fine sand (0.5-1 mm) and soil (0-2 mm and 2-4.8 mm) to determine the effects of freezing and thawing on sloping land drainage. Relations between structure and texture, rates and extent of ice formation, and rates and magnitudes of drainage were determined. Decreasing temperatures and subsequent ice formation decreased the relative mobility of water, thereby increasing water retention and decreasing rates of water transmission. The magnitude of the short-term, freeze-thaw effects on soil water retention and transmission was influenced by soil aggregate size, aggregate stability, and soil water content during freezing. On a long-term basis, drainage that results in a consistently lower water content during freeze-thaw cycles may lead to a changed soil structure and thus a changed drainage requirement. (Knapp-USGS)
W70-09380

A GAMMA-PHOTONEUTRON METHOD FOR LABORATORY STUDIES OF SOIL WATER,
Du Pont de Nemours (E. I.) and Co., Aiken, S.C.
J. C. Corey, R. H. Hawkins, and R. F. Overman.
Soil Science Society of America Proceedings, Vol 34, No 4, p 557-560, July-August 1970. 4 p, 3 fig, 1 tab, 13 ref. USAEC Contract AT (07-2)-1.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, Deuterium, Heavy water, Nuclear meters, Bulk density, Soil texture, Laboratory tests, Instrumentation.
Identifiers: Photoneutron meters.

Using the gamma-photoneutron method, the heavy water content of laboratory soil columns can be measured independently of bulk density of soil, soil texture, light water content, and type of clay mineral. The method requires a radioactive source that emits gamma photons in excess of 2.23 Mev and a neutron detector. The neutron detector measures photoneutrons produced when the deuterium nuclei in the gamma radiation field split into a photoneutron and a proton. The number of photoneutrons detected is linearly related to the heavy water content of the soil column. (Knapp-USGS)
W70-09382

MEASUREMENT OF WATER POTENTIAL AND OSMOTIC POTENTIALS IN SOIL WITH A COMBINED THERMOCOUPLE PSYCHROMETER AND SALINITY SENSOR,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
R. D. Ingvalson, J. D. Oster, S. L. Rawlins, and G. J. Hoffman.
Soil Science Society of America Proceedings, Vol 34, No 4, p 570-574, July-August 1970. 5 p, 5 fig, 2 tab, 9 ref.

Descriptors: *Soil moisture meters, *Water chemistry, *Osmotic pressure, Instrumentation, Soil-water-plant relationships, Moisture stress, Salinity, Wetting, Drying, Laboratory tests.
Identifiers: Soil water chemistry, Matric potential, Psychrometers.

A combined thermocouple psychrometer and salinity sensor, which is embedded in a single ceramic body, is described. This design makes possible the measurement of the water and osmotic potentials of soil water at the same location in the soil. Errors produced by spatial variations in soil solution concentration, shown to be large, were eliminated by the instrument's ability to make both measurements on a single sample of soil solution. The instrument was tested in a soil-plant-water system, and the data obtained are reported.

Desaturation of the ceramic at matric potentials more negative than -2 bars was shown to have a significant effect on conductance of the salinity sensor. Correction for this effect is discussed. Measurements showed that cotton plants extracted more water from the less saline zones in the soil. This had the effect of lowering the water potential to approximately the same value at two depths in the soil profile at the end of a drying cycle. (Knapp-USGS)
W70-09384

2H. Lakes

FACTORS AFFECTING THE MOVEMENT OF WATER AND ORGANISMS WITHIN A REGULATED MULTIPURPOSE LAKE,
Washington State Water Research Center, Pullman.
Gerald F. Kraft, and David T. Mason.
Available from NTIS as PB-193 680, $3.00 in paper copy, $0.65 in microfiche. Completion Report, July 29, 1970. 17 p, 4 fig.

Descriptors: Lakes, Lake shores, Multiple-purpose reservoirs, Limnology, Thermal properties, E. coli, Density currents, Washington.
Identifiers: Lake Whatcom.

Lake Whatcom, in northwest Washington, occupies a glaciated former stream valley. It is an elongate multipurpose lake, 12 miles long and averaging 3/4 mile in width, of considerable depth (150 feet average), and is moderately eutrophic. A 40-inch pipeline delivers glacial melt water from the Middle fork of the Nooksack River 20 miles away to the southeast extremity; the outflowing stream and domestic water-supply pipeline (city of Bellingham) are at the northwest end. Surface current patterns induced by wind have been identified within the lake and have been reproduced in a fiberglas 1:2400-scale model. It was found that thermal barriers reduce daily the intermixing of surface waters between the major depressions in the lake. Near-shore patterns of these thermal barriers were correlated with an observed 10-fold increase in bacterial concentration between the fifteenth and first meter off-shore. A study was made of the survival time of the bacteria Escherichia coli, Staphylococcus aureus, unidentified lake isolates, and the blue-green alga Haematococcus lacustris, under various light intensities and in variously treated aged lake water. It was tentatively concluded that the rate of bacterial activity increased in the presence of phytoplankton, under specific light-intensity conditions. An analysis of littoral vegetation distribution has resulted in the identification of three communities. (Kraft-Washington State)

MONTHLY MEAN SURFACE TEMPERATURES FOR LAKE ONTARIO AS DETERMINED BY AERIAL SURVEY,
Meteorological Service of Canada, Toronto (Ontario).
Michael S. Webb.
Water Resources Research, Vol 6, No 3, p 943-956, June 1970. 14 p, 18 fig, 2 tab, 18 ref.

Descriptors: *Lake Ontario, *Evaporation, *Water temperature, *Surveys, *Remote sensing, Infrared radiation, Humidity, Solar radiation, Mass transfer, Mapping, Great Lakes.
Identifiers: Water surface temperature.

For calculations of evaporation losses by mass transfer techniques, and for many other research and operational applications, it is necessary to know the mean patterns of surface water temperature. Preliminary patterns of monthly mean surface water temperatures are presented for Lake Ontario, based on 36 airborne radiation thermometer surveys over a three-year period. Temperature values at each of the 89 points in a grid have been plotted against calendar date, and an annual temperature curve has been produced for each point. Values for the middle of each month have been determined by interpolation, and used to produce a pattern for each month. (Knapp-USGS)

WATER BUDGET OF UPPER KLAMATH LAKE SOUTHWESTERN OREGON,
Geological Survey, Washington, D.C.
Larry L. Hubbard.
For sale by US Geological Survey, Washington, DC 20402 - Price $0.50. US Geological Survey Hydrologic Investigations Atlas HA-351, 1 sheet, 1970. Text, 1 fig, 1 map, 4 graph, 1 tab, 5 ref.

Descriptors: *Lakes, *Oregon, *Hydrologic budget, *Water balance, Streamflow, Springs, Precipitation (Atmospheric), Discharge (Water), Water storage, Water level fluctuations, Evapotranspiration.
Identifiers: Klamath Lake (Oreg).

A 1-sheet hydrological atlas presents a quantitative water budget for Upper Klamath Lake. It includes an inventory of water entering and leaving the lake and changes in lake storage for the 3-year period Oct. 1, 1964, to Sept. 30, 1967. Upper Klamath Lake, just east of the Cascade Range and about 17 miles north of the California State line, has a drainage area of 3,810 sq mi and is the largest lake in Oregon. It is about 22 mi long, with about 165 mi of shoreline and a mean depth of about 8 ft. Depths reach 40 to 50 ft in a narrow strip of the lake between Eagle Ridge and Bare Island. Mean annual precipitation is 14 inches at Klamath Falls at the south end of the lake and 18 inches at Chiloquin near the northeast end of the lake. Much of the precipitation in the lake area falls as snow from November through March. Average annual lake evaporation is about 40 inches. Surface inflow provided 79% of the total inflow to the lake. Precipitation falling directly on the lake provided 7% of the total inflow. Surface outflow constituted 84% of the outflow from the lake. Over the 3-year study period, evapotranspiration accounted for the remaining 16% of the total outflow. During the period of the study there was slight net decrease in lake storage. (Knapp-USGS)

ELEMENTS OF THE WATER BALANCE OF SMALL RESERVOIRS OF THE CENTRAL CHERNOZEM PROVINCES,
I. N. Sorokin.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic, US Agricultural Research Service, p 107-143, 1967. 37 p, 4 fig, 8 tab, 26 ref.

Descriptors: *Water balance, *Reservoirs, *Ponds, *Chernozems, Surface waters, Groundwater, Discharge (Water), Irrigation, Seepage, Evaporation, Runoff, Rivers, Mapping, Seasonal, Floods, Precipitation (Atmospheric), Gaging stations.
Identifiers: *USSR, Chernozem Provinces.

The water balance and hydrological regime of small reservoirs and ponds of the Chernozem Provinces of the USSR were experimentally investigated by collecting and analyzing inflows of surface water, annual runoffs, winter floods, precipitation, evaporation, and seepage data. A comparison of the mean surface runoffs in spring of small rivers and intermittent watercourses with previously made maps shows that in many cases these values are in close agreement. Winter floods occurred in seven of the ten winters of 1950 to 1959, In the northern part of the Chernozem province evaporation losses are about 20% of the normal volume of ponds. In the Karsk Province and the Voronezh Province they are 40 and 50%, respectively. Seepage changes are affected by the fluctuations of reservoir water levels. (See also W70-09312) (Gabriel-USGS)

FACTORS AFFECTING SEED GERMINATION UNDER SOIL MOISTURE STRESS,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
A. Hadas.
Israel Journal of Agricultural Research, Vol 20, No 1, p 3-14, Jan 1970. 6 fig, 2 tab, 12 ref.

Descriptors: *Seeds, *Germination, *Moisture stress, *Soil moisture, *Diffusivity, Arid lands, Semiarid climates, Plant growth, Vegetation establishment, Soil-water-plant relationships, Environmental effects, Viability, Moisture availability, Clovers.
Identifiers: *Israel, *Chickpeas.

Factors intrinsic to the seed, to the soil, or to both seed and soil may inhibit germination of seeds under soil moisture stress. The relative importance of such factors was evaluated, including soil moisture potential, soil moisture diffusivity, water diffusivity of seeds, and characteristics of the seed-soil interface. Experimental results from chickpea (Cicer arietinum L. local variety) and clover (Trifolium alexandrinum L. var. Musgawi) suggested that germinating seed can be supplied with soil moisture at a rate equal to or greater than the capacity of the seed to absorb it. Both the amount of water actually absorbed by the seed and the subsequent germination rate depended on the adaptability of the internal moisture potential of the seed and on the real potential at the seed-soil interface. In this experiment it also appeared that the effective stress of the soil matrix had little, if any, influence on germination. (Carr-Arizona)
W70-09135

THE EFFECT OF SOIL MOISTURE LEVEL OF THE INCIDENCE OF EARLY BLIGHT ON POTATO AND TOMATO PLANTS,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agriculture Research.
J. Rotem.

Israel Journal of Agricultural Research, Vol 19, No 3, p 139-141, July 1969. 1 tab, 1 fig, 4 ref.

Descriptors: *Potatoes, *Tomatoes, *Blights, *Soil moisture, *Turgidity, Plant diseases, Infection, Disease resistance, Environmental effects, Arid climates, Arid lands, Irrigation effects, Irrigation, Irrigation programs, Moisture uptake, Soil water, Field crops, Crop production, Leaves, Soil-water-plant relationships.
Identifiers: *Early blight, *Israel, *Negev Desert, *Irrigated agriculture, Flowers.

Potted potato and tomato plants were inoculated with Alternaria porri f. sp. solani and studied to see what effect various soil moisture levels would have on the incidence of early blight. High levels of soil moisture before inoculation were found to be associated with increased susceptibility to the disease. Higher moisture levels were also directly related to increased yield/foliage weight ratio, which is a known predisposing factor for early blight. In half of the tomato plants the effect of different yield/foliage weight ratios resulting from various irrigation treatments was nullified by removing the flowers. For these plants, low soil moisture level was associated with the highest degree of infection (LSD = 5 percent). In the experiment with potatoes, increased leaf turgidity resulted in greater susceptibility to blight in all of the irrigation treatments. It would appear that the increased susceptibility of tomatoes and potatoes to early blight when grown at high soil moisture levels is due to the high yield/foliage weight ratio, which is in turn associated with a lowering of the resistance mechanism. THE STABILITY OF WHEAT EMBRYO GLUTAMATE DECARBOXYLASE UNDER CONDITIONS OF WATER STRESS,
Texas Univ., Arlington. Dept. of Biology.
Claude Nations.
Canadian Journal of Botany, Vol 45, No 11, p 1917-1925, Nov 1967. 3 fig, 2 tab, 17 ref.

Descriptors: *Wheat, *Drought resistance, *Moisture stress, *Enzymes, *Plant physiology, Proteins, Lipids, Molecular structure, Drought tolerance, Germination, Embryonic growth stage, Semiarid climates.
Identifiers: *Glutamate decarboxylase, *Seedlings.

The stability of glutamate decarboxylase in wheat embryos and seedlings (Triticum aestivum L. variety concho) was studied in an attempt to obtain information suggesting a molecular basis for plant drought resistance. Decarboxylase activities in germinating wheat grains were measured before and after drying and an effort was made to relate enzyme activity to a soluble or particulate cell fraction by differential centrifugation. Active protein preparations were subjected to defatting treatments with n-butanol and then their responses to drying were measured. While decarboxylase activity in germinating wheat increased for 54 hr, enzyme stability decreased during this period. No activity could be detected in particulate cell fractions. The responses to desiccation by the extracted enzyme suggest that the stability of decarboxylase may lie in its ability to dissociate into smaller protein components when under moisture stress. It appears that this ability may depend upon the presence of lipids, which might be the source of a reversible association between enzyme components. (Carr-Arizona)

Descriptors: *Halophytes, *Osmotic pressure, *Water balance, *Salt tolerance, *Water potential, Turgidity, Soil-water-plant relationships, Chlorides, Cations, Anions, Conductivity, Leaves, Sodium, Potassium, Calcium, Magnesium.
Identifiers: *Glycophytes, *Osmotic adjustment, *Relative water content, *Cell sap, Refractive index, Block design, Hoagland culture solution, Trifoliate leaves, Split-plot design.

Studies on glycophytes and halophytes in saline solutions have shown that osmotic adjustment takes place through ionic absorption and resulting increased water uptake. These experiments differed from actual field conditions in that the salinity levels were constant. Bean seedlings (Phaseolus vulgaris) were exposed to increasing NaCl concentrations, up to-2.8 atmospheres, over varying increments of time. The increasing salinities caused a reduction in water potential accompanied by a slower reduction in osmotic potential (OP) and consequent reductions in relative water content and tissue turgor (P). Sap concentrations, both metabolites and ions increased. The inorganic increas, especially chloride, was most prominent. This in turn caused increased P, which levelled off at final constant salinity. The sap OP decreased less rapidly than the external solution while tissue water potential decreased more rapidly than either. These effects were proportional to salinity rates of change. Adjustments to constant salinity resulted from gradual ion accumulation. The bean plant is therefore capable of adjusting its water balance depending on the rate of change of salinity and tissue age. PHYSIOLOGICAL RESPONSES TO TEMPERATURE AND DESICCATION IN THE ENDEMIC NEW MEXICO PLETHODONTIDS, PLETHODON NEOMEXICANUS AND ANEIDES HARDII,
New Mexico State Univ., University Park. Dept. of Biology.
Walter G. Whitford.
NASA Grant NGR 32-003-27. Copeia, No 2, p 247-251, June 5 1968. 2 fig, 4 tab, 13 ref.

Descriptors: *Salamanders, *Physiological ecology, *Moisture stress, New Mexico, Ecology, Animal behavior, Distribution patterns, Amphibians, Circulation (Animals), Oxygen requirements, Respiration, Semiarid climates.
Identifiers: *Critical thermal maxima, *Oxygen consumption, *Tissue de siccation, *Heart rate, Relict species, Critical activity point, Temperature-metabolism curves.

The physiological parameters, oxygen consumption, desiccation limits, and critical thermal maxima (CTM) are valuable in interpreting ecological relationships and distributions of amphibia. Plethodon neomexicanus and Aneides hardii are 2 relict species of plethodontid Salamanders in the Jemez Mountains of New Mexico. The mean CTM of both species are almost identical and similar to that of a relative living in cold mountain streams of southern Appalachia. This probably reflects adaptations to their cold microhabitat. Thermetabolism-temperature curves differed and were probably related to differences in respiratory surface area since cutaneous gas exchanged accounts for 75-90 percent of total oxygen consumption in plethontids. Differences in desiccation rates may be due to differences in behavior while in the dessication chamber. P. neomexicanus is similar to other western species in having a higher tolerance to desiccation than eastern plethodons. This together with the requirement of fairly low, ambient temperatures to obtain sufficient metabolic oxygen indicates a dispersal from the east, across Oklahoma to New Mexico, possibly during the Pleistocene. (Casey-Arizona)

MINERAL METABOLISM OF HALOPHYTES,
California Univ., Davis. Dept. of Soils and Plant Nutrition.
Emanuel Epstein.
Supported by grants from the Office of Saline Water, U.S. Department of the Interior. In: Ecological Aspects of the Mineral Nutrition of Plants, Blackwell Scientific Publications, London, p 345-356, 1969. 3 fig, 22 ref.

Descriptors: *Halophytes, *Salt tolerance, *Osmotic pressure, *Water balance, *Carriers, Sodium, Chlorides, Potassium, Arid lands, Turgidity, Water stress, Soil-water-plant relationships, Calcium.
Identifiers: *Mineral metabolism, *Glycophytes, *Osmotic adjustment.

Halophytes are a varied flora of oceans, other salty waters and arid and semi-arid lands. Within the general limits of all plants they (1) Are salt-tolerant (2) Selectively acquire essential elements and water, often against high concentration gradients (3) Block excessive ion uptake which would interfere with cellular metabolic mechanisms or tissue osmotic potentials. Carriers in the cell membrane operate to selectively absorb certain ions. For a given ion, 2 types of carrier probably exist. One operates at low external concentrations up to 0.5 mM, excluding other ions. It occurs in both halophytes and salt-sensitive plants. The second type operates at high external concentrations, in some cases greater than 50 mM. Both leaf and long-term experiments with Atriplex and Agropyron species verify the second type crucial in halophytes. Selective ionic absorption causes an equilibration of external and tissue osmotic pressures resulting in a plant water potential that maintains adequate tissue turgor. Salt glands and succulence are 2 other salt-tolerance mechanisms occurring in some halophytes. (Casey-Arizona)

Identifiers: *Body fluids, *Fossorial animals, Bradycardia.

Three species of fossorial New Mexican toads, Scaphiopus hammondi Bufo punctatus and Bufo cognatus, survive desiccating desert conditions by aestivating in their burrows for 10 months a year. The gross metabolic factors of heart rate and body fluids were measured in both aestivating and non-aestivating specimens. Heart rates as measured by electrocardiograms decreased 4-6 fold with number of days burrowed. Recently surfaced animals had control level heart rates. This bradycardia associated with aestivation is probably a reflection of reduced metabolism. Importantly, reductions in both heart rate and metabolism were temperature-independent. Body fluid chlorides showed a small increase, hemoglobin a small

crease, and urea doubled. The urea increase was pected because it is a major fossorial anuran ter conservation mechanism in xeric habitats. asey-Arizona)

ATER ECONOMY OF THE GREEN-TAILED OWHEE (CHLORURA CHLORURA),
izona Univ., Tucson. Dept. of Biological iences.
Linwood Smith, and Robert D. Ohmart.
Physiological Systems in Semiarid Environnts, University of New Mexico Press, p 115-124, 69. 4 fig, 10 ref.

escriptors: *Birds, *Moisture stress, *Physiologil ecology, Arid lands, Arizona, Water balance, imal behavior, Animal physiology.
entifiers: *Green-tailed Towhees, Water econo-y.

vo crucial water economy adaptations in desert imals are the relative abilities to tolerate hydration and to utilize saline drinking water. ie Green-tailed Towhee winters in southern rizona but is not a resident or desert bird. It was own it needs 3-5 milliliters of water per day to aintain its body weight and could discriminate tween distilled and salt water. Expressed as ecentage of body weight, the distilled water ank by 10 adults (68.2) was significantly greater an 0.1M Na Cl solution (58.5). Similarly daily ody weight fluctuations were only significant with l and 0.2 M NaCl. Of 20 birds tested on 0.25 M aCl solution, half died in 6 days and 7 survived 18 ys with little weight loss. Of these, 4 survived on 3M NaCl and 1 on 0.35 M NaCl. No enlarged sal salt glands were found on those dying from 3-0.35M NaCl. The appearance of 2 intraspecific oups with respect to 0.25M NaCl solution utilizaon could not be explained with present data. Posbilities are: (1) Individual variation (2) Evolution a physiological subspecies (3) Derivation from a rically-adapted parental stock. The water econoy efficiency of small desert birds has been shown be greater than that of the Green-tailed Towhee. Casey-Arizona)

HE ROLE OF VEGETATION IN SOIL WATER ROBLEMS,
othamsted Experimental Station, Harpenden England).
L. Penman.
rench resume. In: Water in the Unsaturated Zone, ol I, Proceedings of the Wageningen Symposium, he Netherlands, June 19-25, 1966, International ssociation of Scientific Hydrology, Publication lo 82, p 49-61, 1968. 13 p, 2 fig, 1 tab, 26 ref.

escriptors: *Soil-water-plant relationships, Evapotranspiration, *Evaporation, Vegetation efects, Water balance, Soil water movement, Moisture tension, Humidity, Root distribution, Root zone, Soil moisture, Permeability, Weather.
dentifiers: *Potential evaporation, Potential vapotranspiration.

he main mechanism for producing unsaturation is vaporation from growing plants. In some clay soils he drying produces cracks whose persistence may letermine soil permeability at saturation. Movenent of water, and limiting values of soil water conents, are determined by soil moisture potentials, nd energy supply is rarely a controlling factor. The ower limit of water content depends on the depth f root penetration, and the degree of ramisfication within the root depth: plant and soil characters letermine these quantities. Adding the concept of accessibility to that of availability reconciles some clashes in field evidence about how long actual evaporation remains equal to potential evaporation. Examples of plant/soil interactions considered include a range of soil depths, contrasts in plant type and different climates. (See also W70-09263). (Knapp-USGS)

A STUDY OF THE AQUATIC ECOSYSTEMS IN TWO NATIONAL WATERFOWL REFUGES IN MISSISSIPPI,
Mississippi State Univ., State College. Water Resources Research Inst.
Dale H. Arner, Earl D. Norwood, and Billy M. Teels.
Available from NTIS as PB-193 677, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Water Resources Research Institute, June 1970. 32 p. OWRR Project A-036-MISS.

Descriptors: *Aquatic environment, *Aquatic animals, *Wood duck, *Ecosystems, *Invertebrates, *Waterfowl, Phytoplankton, Mississippi, Soils, Dissolved solids, Water chemistry, Soil chemistry.
Identifiers: Noxubee national waterfowl refuge, Yazpp national waterfowl refuge.

A study was made of the aquatic ecosystems of the Yazoo and Noxubee national waterfowl refuges in Mississippi. This study revealed the following: (1) Soils of the Yazoo refuge were higher in potash and less acid than the Noxubee soils. (2) Water analysis revealed that the water of the Yazoo refuge had greater concentration of several important dissolved solids and more carbon dioxide than the Noxubee refuge. (3) Phytoplankton concentrations were greater in the Yazoo refuge. (4) During the late winter and early spring season a larger biomass of invertebrates was found in the aquatic plant communities of the Yazoo refuge. (5) The mean clutch size of wood ducks using artificial nesting boxes in the Yazoo refuge was higher than in the Noxubee refuge.

2J. Erosion and Sedimentation

TRACER STUDIES ON THE MOVEMENT OF SAND AND GRAVEL,
Kyoto Univ. (Japan).
Katsumasa Yano, Yoshito Tsuchiya, and Masanori Michiue.
13th Congr Int Assn. Hydraul Res, Proc Vol 2, p 121-129, Aug-Sept 1969. 9 p, 6 fig, 11 ref.

Descriptors: *Sediment transport, Sediment discharge, Sedimentation, Bed load, *Tracers, Sands, Gravels, *Mathematical models, *Laboratory tests, Stochastic processes, Equations, Foreign research, Color.
Identifiers: *Stochastic models, *Bedload movement, Particle velocity, Formulas, Empirical equations, Japan, Hydrologic models.

xperiments using colored sand and gravel as tracers in a laboratory flume show that irregular and intermittent movement of sand and gravel in a stream can be simulated by a stochastic model. The stochastic model and experimental results show that the distribution of traveling distance of a single step of sand grains can be described by an exponential function. Relations between the average traveling distance of a single step and the probability for the beginning of movement of sand grains per unit time, and the parameter of flow intensity are discussed. Empirical formulas based on the tracer experiments are proposed for estimating average traveling velocity and bedload discharge of sand and gravel for the regime of flat beds. (USBR)
W70-09024

AN ELECTRO-OPTICAL PROBE FOR MEASUREMENT OF SUSPENDED SEDIMENT CONCENTRATION,
Iowa Univ., Iowa City.
Protosh K. Bhattacharya, John F. Kennedy, and John R. Glover.
13th Congr Int Assn. Hydraul Res, Proc Vol 2, p 241-250, Aug-Sept 1969. 10 p, 6 fig, 2 ref.

Descriptors: Sediment concentration, *Sediment load, Sediments, Light waves, Sediment transport, *Suspended sediments, Measuring instruments, *Optical instruments, Optical properties, Turbidity, Light penetration, Instrumentation, Sedimentation.
Identifiers: Probes (Instruments), Optical measurements, Light beams, *Light-scattering method, Photometers.

A newly developed instrument for measuring suspended sediment concentration in situ in rivers, estuaries, and shoaling waves is described. The probe has a gallium arsenide diode as a light source and a silicon planar diode as a light sensor. The light is attenuated by the suspended sediment concentration; light attenuation is proportional to the sediment surface area per unit volume of the suspension, resulting almost exclusively from light scattering at particle surfaces. Probe circuitry and appurtenant instruments are described, and calibration and response characteristics are given. Frequency response is adequate for measuring turbulent fluctuations and periodic variations of sediment concentration. Some data obtained in steady uniform flow and in breaking waves are summarized. THE EFFECT OF BED-LOAD MOVEMENT ON THE VELOCITY DISTRIBUTION OF FLOW,
Kyoto Univ. (Japan); and Osaka Prefectural Technical Coll., Neyagawa (Japan).
Katsumasa Yano, and Atsuyuki Daido.
13th Congr Int Assn Hydraul Res, Proc Vol 2, p 325-332, Aug-Sept 1969. 8 p, 6 fig, 4 ref.

Descriptors: *Bed load, *Velocity distribution, Laboratory tests, Open channel flow, Hydraulic laboratories, *Sediment load, *Streamflow, Shear stress, Sediments, Particles, Hydraulics, Rotational flow, *Movable bed models, Rotation, Hydrology, Reynolds number, Turbulent flow, Saltation.
Identifiers: *Bedload movement.

The velocity distribution near the bed for bedload-laden flow deviates from the well-known logarithmic-velocity-distribution law. The deviation is caused by shear stress generated by the rotation of sediment particles. If liquid mass transport is caused by sediment rotation, a difference of momentum of the main flow direction generates between the upper and the lower layer of the rotation axis of the sediment particle. The difference of momentum is the stress component on an area element normal to the main flow axis. The shear stress caused by the sediment rotation must be added to Reynolds stress. Using the above hypotheses, a theory of velocity distribution was developed. Theoretical results showed that the velocity distribution for the bedload-laden flow holds a linear relation on the new semilogarithmic coordinates introduced to reflect the effect of shear stress caused by sediment rotation. Experimental results showed that the velocity in the regions affected and not affected by sediment are connected with one linear relation in the new semilogarithmic coordinates. The gradient of linear relation is derived. (USBR)

PLANT COVER, RUNOFF, AND SEDIMENT YIELD RELATIONSHIPS ON MANCOS SHALE IN WESTERN COLORADO,
Geological Survey, Denver, Colo.
F. A. Branson, and J. B. Owen.

Water Resources Research, Vol 6, No 3, p 783-790, June 1970. 8 p, 6 fig, 1 tab, 18 ref.

Descriptors: *Soil-water-plant relationships, *Rainfall-runoff relationships, *Sediment yield, Geomorphology, Topography, Correlation analysis, Drainage patterns (Geologic), Drainage density, Runoff forecasting, Hydrograph analysis, Streamflow forecasting, Colorado.
Identifiers: Plant cover-runoff-sediment yield relations, Grand Junction (Colorado).

Relationships between vegetation and hydrologic measurements for 17 watersheds near Grand Junction, Colorado, were subjected to correlation analyses. Six years of vegetation measurements, four vegetation measurement methods, and 15 years of hydrologic records were used in the analyses. Highly significant correlation coefficients were found for percent bare soil and runoff, but the relationships between bare soil and sediment yields were not statistically significant. Geomorphic parameters such as angle of junction, mean slope, drainage density, relief ratio, length-width ratio, and watershed area were more highly correlated with sediment yields than with runoff. Correlation coefficients for spring vegetation measurements and runoff were higher than for autumn measurements. First contact methods and step point vegetation measurement methods were superior to the loop method and the all contacts point method. Curves for the relationship of runoff to bare soil were strikingly different for three sets of watersheds from different precipitation zones. Bare soil measurements may provide rapid and inexpensive estimates of runoff for watersheds similar to the ones studied. (Knapp-USGS)
W70-09118

FLUME STUDIES OF THE SEDIMENT TRANSFER COEFFICIENT,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
Neil L. Coleman.
Water Resources Research, Vol 6, No 3, p 801-809, June 1970. 9 p, 5 fig, 3 tab, 17 ref.

Descriptors: *Sediment transport, *Suspended load, *Suspension, *Hydraulic models, Flumes, Bed load, Open channel flow, Alluvial channels.
Identifiers: Sediment transfer coefficient.

Flume experiments show that in open channel flow the sediment transfer coefficient increases with distance from the channel bed, reaching a maximum value at a distance from the bed equal to about 20% of the flow depth, and then tends to remain at a constant value up to the water surface. The experiments also yield evidence indicating that the sediment transfer coefficient is larger for larger particle sizes. (Knapp-USGS)
W70-09119

EFFECTS OF RAINFALL ON SETTLING VELOCITY OF SUSPENDED SEDIMENT IN QUIESCENT WATER,
Texas A and M Univ., College Station; and Florida Univ., Gainesville.
S. I. Bhuiyan, E. A. Hiler, and E. T. Smerdon.
Water Resources Research, Vol 6, No 3, p 810-817, June 1970. 8 p, 7 fig, 1 tab, 12 ref. FWPCA Grant WP-00757-03.

Descriptors: *Settling velocity, *Clays, *Impact (Rainfall), Turbulence, Suspension, Suspended load, Sediment transport, Deposition (Sediments).
Identifiers: Transmissometers.

Concentrations of kaolin and betonite clay suspensions with respect to time were determined in quiescent water by a transmissometer both with and without rainfall impinging on the surface. Rainfall caused significant increase in the settling velocity of sediments in quiescent water. The increase in the settling velocity was more for kaolin particles than for bentonite. Comparative results of the turbulent intensity at four depths caused by rainfall on the quiescent water surface are presented. (Knapp-USGS)

A SYSTEM FOR MEASURING TOTAL SEDIMENT YIELD FROM SMALL WATERSHEDS,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
Harry E. Brown, Edward A. Hansen, and Norman E. Champagne, Jr.
Water Resources Research, Vol 6, No 3, p 818-826, June 1970. 9 p, 12 fig, 7 ref.

Descriptors: *Sampling, *Sediment load, *Sediment yield, Weirs, Dams, Instrumentation, Streamflow, Data collections, On-site data collections, Suspended load, Water analysis.
Identifiers: Sample splitters, Sediment samplers.

Design and calibration data are presented from eight sediment measuring installations that have been constructed and tested by the U.S. Forest Service on the Beaver Creek pilot watershed in Arizona. Each installation includes a low dam and basin to trap coarse sediments and a series of splitters that collect a representative portion of the suspended sediment leaving the basin. The first splitter, a Barnes runoff sampler, is a sharp edged slot extending downstream from the dam spillway. With a 12-foot-wide spillway it extracts a theoretical split of 1/600 of the total volume of flow. The second splitter, an inclined slot mounted at the lower end of the Barnes sampler, extracts a theoretical 0.1 sample. This sample, 1/6000, enters an intermediate storage tank that leads from the middle of the stream channel to a final storage tank on the bank. The third splitter is a single slot, extracting 0.1 sample, mounted below a small rectangular weir in the end of the intermediate tank. The slot, which carries a 1/60,000 sample, enters the final storage tank. Calibration data are presented to characterize sampler performance, and a procedure is outlined for calculating total sediment yield. Errors in estimating total sediment are usually less than 18%. (Knapp-USGS)
W70-09121

STREAM ORDER AS A MEASURE OF SAMPLE SOURCE UNCERTAINTY,
South Carolina Univ., Columbia.
W. E. Sharp.
Water Resources Research, Vol 6, No 3, p 919-926, June 1970. 8 p, 3 fig, 3 tab, 13 ref.

Descriptors: *Drainage patterns (Geologic), *Channel morphology, *Geomorphology, *Sampling, Statistical methods, Topography, Data collections, Statistics, Stochastic processes, Markov processes, Probability, Path of pollutants.
Identifiers: Stream order, Bifurcation ratio.

The Horton stream order at the outlet of a drainage basin is a direct measure of the uncertainty (entropy) of the source supplying any discrete particle or atom detected at the outlet. If m is the order of the main stream in a basin, the uncertainty that the source lies in the drainage area of an ith order tributary is given by m - i. This may be interpreted as representing the minimum number of tests or samples needed to find a single contamination source in a sequential search of a drainage basin. Similarly Scheidegger's consistent stream order may be interpreted as being the number of samples required to search a basin for a single source when the link magnitude of the outlet is known. Because natural streams usually have multiple contaminant sources and cannot be expressed as a single branching process, a convenient estimate of the average nunber of samples needed to find a single source is given by (r - 1) (m - i) where r is the bifurcation ratio. (Knapp-USGS)

VISUAL OBSERVATIONS OF SUSPENDE PARTICLE DISTRIBUTION AT THREE SITE IN THE CARIBBEAN SEA,
Naval Oceanographic Office, Washington, D.C
Deep Vehicles Branch.
J. M. Costin.
Journal of Geophysical Research, Vol 75, No 21, 4144-4150, July 20, 1970. 7 p, 4 fig, 11 ref.

Descriptors: *Suspended load, *Atlantic Ocea
Particle size, Turbidity, Sampling, Data collection
Submarines, Density, Stratification, Densit
stratification.
Identifiers: Caribbean Sea.

Maxima and minima in concentrations o
suspended particulate matter were observed fro
the manned submersible Deepstar-4000 at thre
dive sites in the western Caribbean area. Althoug
depths of observed particulate maxima were di
ferent in each area, the layers of densest partic
concentration were found between the 9 deg C an
12 deg C isotherms. This temperature level
generally coincident with the boundary betwee
water of the Subtropical Undercurrent and Suba
tarctic Intermediate Water. It is believed that part
cle layers are a common feature of Caribbea
stratification and result from low particle settlin
velocities, sediment erosion, and decreased vertica
mixing at the depth of the thermal boundary. (K

rth and Planetary Science Letters, Vol 8, No 6, p 1-419, July 1970. 9 p, 3 fig, 2 tab, 19 ref.

escriptors: *Radioactive dating, *Soils, *Sedients, *California, Uranium radioisotopes, adioisotopes, Alluvium, Radioactivity techniques, eistocene epoch, Soil water movement, aching.
entifiers: Fossils, Vertebrate fossils.

nethod of dating sediments and soils is proposed ich utilizes a uranium and actinium series dating buried vertebrate fossils. The method dates the verbank Formation east of Sacramento, Californ, and the overlying San Joaquin soil as 103,000 us or minus 6,000 years. The age is in accordance th cited geological evidence. Chronological grations of uranium, uranium-uptake and aching are related to moisture conditions and rdpan formation. In absence of groundwaters, wer migrations of uranium in rain waters netrating the soil profiles results in mean relence times of uranium within fossils to be less an the total elapsed time. Where groundwater s been present, absorption of uranium by fossils s rapid, the mean residence times of uranium are gher and equal to total elapsed time. U-234/U-8 ratios are lower in the wetter zones where ater facilitates some remixing of uranium otopes. Losses of uranium from some of the fos-s are related to carbonate leaching. (Knapp-SGS)

THE BALANCE METHOD OF COMPUTING SEDIMENT FLOW AND ESTIMATING THE RATE OF SILTING OF RESERVOIRS,
A. F. Kudryoshov.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic, US Agricultural Research Service, p 374-403, 1967. 30 p, 4 fig, 5 tab, 25 ref.

Descriptors: *Silting, *Sedimentation rates, *Reservoirs, *Ponds, *Lakes, Sediment load, Mathematical studies, Estimating, Hydrologic properties, Discharge (Water), Suspended load, Rivers, Bottom sediments, Eddies, Agriculture, Gaging stations, Velocity, Particle size.
Identifiers: *USSR, Chernozem Provinces.

This study presents an analytical and experimental analysis of the application of the balance method for estimating reservoir silting using hydrogeological data recorded at a few reservoirs of the Mzymta River, USSR. The discussion includes: experience in the use of the balance method of estimating sediment flow; physical meaning of the Lakhtin number, and estimating the rate of reservoir silting. Several tables present the distribution of volume-weights of bottom sediments and the granulometric, specific gravity, and other pertinent characteristics of reservoir sediment flows. WATER EROSION, THE FORMING OF SEDIMENT FLOW OF SMALL STREAMS IN THE CENTRAL CHERNOZEM PROVINCES AND MEASURES FOR PROTECTING RESERVOIRS FROM SILTING,
V. Ya Frolov.
Translated from Russia. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic, U S Agricultural Research Service p 204-305, 1967. 102 p, 7 fig, 15 tab, 177 ref, 3 append.

Descriptors: *Erosion, *Erosion control, *Silting, *Sedimentation, *Sediment control, *Reservoirs, Reservoir silting, Lakes, Soil erosion, Agricultural watersheds, Runoff, Seasonal, Forests, Turbidity, Discharge (Water), Mathematical studies, Mapping, Rivers.
Identifiers: *USSR, Chernozem Provinces.

This is a comprehensive and detailed study of the erosion, sedimentation, and measures for erosion and siltation control of small reservoirs and streams of the Chernozem Provinces of the USSR. Soil erosion and the sediment flows of small streams in the Chernozem territory depends on many physical and geographic factors including relief, climate, soil, vegetarion, and others. The principal part of water and sediment flow of small streams is formed during the spring high-water period. Water erosion from fall-plowed land and from winter crops is about the same. The average rate of sediment flow of small streams is about 1.2 to 2.4 tons/hour. Comparison of accepted theoretical and experimental calculation of sediment runoff shows that the discrepancies between the computed and measured values were on the average greater than 50 to 100 percent. The use of empirical formulas for the long-term annual turbidities should considerably minimize these discrepancies. Reduction of inflow of sediment into a reservoir must take into consideration the administrative, economic, phytometeorative and hydrotechnical factors of the territory. (See also W70-09312). (Gabriel-USGS)
W70-09414

TURBIDITY OF RIVERS AND ITS DISTRIBUTION IN THE CENTRAL CHERNOZEM PROVINCES,
Ya. K. Kovalev.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic; collection of papers translated for U S Agricultural Research Service, p 187-203, 1967. 17 p, 4 fig, 1 tab, 10 ref.

Descriptors: *Turbidity, *Rivers, *Sediment yield, *Streamflow, Erosion, River basins, Mapping, Sediments, Suspended load, Forests, Seasonal, Snow, Topography, Geology, Floods, Precipitation (Atmospheric), Vegetation.
Identifiers: *USSR, Chernozem Provinces.

The average turbidity of rivers in the Central Chernozem Provinces, of the USSR were investigated and average long-term turbidity versus catchment area curves for four turbidity zones (20-50 g/cu m, 50-100 g/cu m, 100-200 g/cu m, and 200-500 g/cu m) were drawn. On the basis of these studies the map of the zones of average turbidity for the rivers of the Central Chernozem Provinces was constructed. The turbidity determined from this map should provide better information for the distribution of erosion processes in the territory and for the design of erosion control measures. (See also W70-09312). (Gabriel-USGS)

CHARACTERISTICS OF SILTING OF SMALL RESERVOIRS OF THE CENTRAL CHERNOZEM PROVINCES AND COMPUTATION OF DENSITY OF BOTTOM DEPOSITS,
L. V. Yakovleva.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic; collection of papers translated for U S Agricultural Research Service, p 306-329, 1967. 24 p, 4 fig, 5 tab, 19 ref.

Descriptors: *Reservoirs, *Lakes, *Ponds, *Silting, *Sedimentation, *Sedimentation rates, Mapping, Turbidity, Sediment transport, Erosion, River basins, Particle size, Organic matter, Mathematical studies, Sands, Silt, Clays, Sedimentary petrology.
Identifiers: *USSR, Chernozem Provinces.

Silting of 44 small reservoirs in the Chernozem Provinces of the USSR was investigated analytically and experimentally by using the Lane-Koelzer formula, the Miller formula, and the Drozd-Myalkovskiy formula. A comparatively good agreement between values computed by Miller's formula and actual values was obtained for the ponds of up to 75 years of age, whereas the use of the Drozd-Myalkovsky formula resulted in errors up to 50% and more for old ponds. Large deviation from actual values was recorded by using the Miller and Drozd-Myalkovskiy formulas for a reservoir only 6 years old and for one 65 years old. (See also W70-09312). (Gabriel-USGS)

Descriptors: *Silting, *Sedimentation, *Reservoirs, *Ponds, *Lakes, *Mathematical studies, Erosion, Water supply, Discharge (Water), Sedimentation rates, Abrasion, Precipitable water, Industrial wastes streamflow, Turbidity, Statistical methods, Water loss.
Identifiers: USSR, Chernozem Provinces.

After briefly discussing the causes inducing the precipitation of various substances in small reservoirs the author describes and analyzes the principal methods of computing silting in small reservoirs, the dependence of the trap efficiency of a reservoir on the degree of regulation of water flow and gives a few nomograms of silting whose construction is based on a few simple analytical expressions. The nomograms permit the computation of the value of the average annual loss of reservoir capacity for some period of time (T) by knowing the average annual turbidity of the water flow, the average volume-weight of the deposits, and the ratio of two indices, a and b. An example of using the nomograms is given. (See also W70-09312). (Gabriel-USGS)

EROSION CONTROL ON ROADSIDES IN TEXAS,
Texas Transportation Inst., College Station.
Wayne G. McCully, and William J. Bowmer.
Available from NTIS as PB-191 353, $3.00 in paper copy, $0.65 in microfiche. Texas Transportation Institute Research Report 67-8 (final), July 69. 37 p.

Descriptors: *Erosion control, Roadbanks, Vegetation establishment, Road construction, Planting management.

A progress report is made of a study recommending practices for vegetation establishment (seed mixtures, fertilizers, liming, soil preparation, planting dates and mulching) in various climatic and geographical regions in Texas. Tables indicating seed mixtures and planting dates for clay and sandy soil textures with a map designating geographical areas is included for reference. Illustrations, depicting methods, equipment operation and results of some experiments are included in the report. (BPR)

A STUDY OF THE HYDROCHEMICAL FACIES OF THE WILCOX AQUIFERS IN MISSISSIPPI,
Mississippi State Univ., State College. Water Resources Research Inst.
Donald M. Keady.
Available from NTIS as PB-193 685, $3.00 in paper copy, $0.65 in microfiche. Completion Report, July 1970. 42 p, 8 tab, 14 fig, 22 ref. OWRR Project A-038-MISS (1).

Descriptors: *Groundwater, *Dissolved solids, *Aquifer characteristics, *Chemical analysis, *Carbonates, Water quality, Iron, Mississippi, Aquifers, Geochemistry, Geologic formations, Calcium carbonate, Chlorides.
Identifiers: *Facies, Hydrochemical facies, Wilcox aquifers, Sodium carbonate.

The original concept of hydrochemical facies is modified using a simple linear model that is consistent with the definition of a facies. The model provides useful numerical parameters derived from the samples available. A set of 244 samples from the Wilcox and Meridian-Wilcox aquifers yielded eight significant hydrochemical facies containing 186 of the samples. The exclusion of the remaining samples indicates the sensitivity of the model. The eight facies are of the same general classes of water expected in sand aquifers in the coastal plain, but their characteristics are more closely defined. Maps showing the distribution of the facies reflect the geologic setting of the aquifers and the modification of the chemical quality of the water. From the outcrop down the dip the facies change from calcium-bicarbonate types to sodium-bicarbonate types to sodium-bicarbonate-chloride types. A large area of high quality sodium-bicarbonate water is present in the aquifers, especially in the Meridian-Wilcox. Other measures of water quality can be related to the hydrochemical facies in some cases, but many require separate study. Maps of the distribution of dissolved iron show several large areas where iron content is exceptionally high, especially in the Meridian-Wilcox aquifer. (Keady-Mississippi State)

CHEMICAL COMPOSITION OF THE ICE OF OTKAZNENSKIY RESERVOIR,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
I. M. Korenovskaya, and M. N. Tarasov.
Translated from Hydrochemical Materials (Gidrokhimicheskiye Materialy), Vol 49, p 25-38, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 149-160, 1969. 12 p, 2 fig, 1 tab, 17 ref.

Descriptors: *Water chemistry, *Ice, *Freezing, *Reservoirs, *Iced lakes, Lake ice, Aqueous solutions, Limnology, Water quality, Solutes, Geochemistry.
Identifiers: Reservoir ice, Ice chemical composition.

The chemistry was studied of ice formation in a reservoir in the USSR. The purposes of the investigation were to trace the change in the mineralization and chemical composition of the ice with time to determine the degree of vertical and horizontal distribution of the chemical characteristics of the ice cover of the reservoir, and to establish quantitatively how ice formation affects the increase in water mineralization during freeze-up. In the winter of 1967, the mineralization of the ice on Otakznenskiy Reservoir decreased gradually from 360 to 60 mg/liter by a factor of 6. Although the mineralization of the under-ice water was spatially uniform, ice composition differed in the vertical and horizontal directions. The mineralization of the upper ice layers was 3-10 times higher than that of the lower and differed at individual stations by a factor of 1.5-3.4. Despite the uneven mineralization of the ice, the average relative chemical composition remained practically constant with time and over the area. The ice formation process has a marked influence on the change in the mineralization of the water of the reservoir. Owing to this factor, water mineralization increased by 8% in the course of a month. (Knapp-USGS)
W70-09097

HYDROCHEMICAL REGIME AND SALT BALANCE OF OTKAZNENSKIY RESERVOIR IN THE FIRST YEAR OF ITS EXISTENCE (1966),
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
I. M. Pavelko, and M. N. Tarasov.
Translated from Hydrochemical Materials (Gidrokhimicheskiye Materialy), Vol 49, p 48-54, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 160-166, 1969. 7 p, 3 fig, 2 tab, 9 ref.

Descriptors: *Water chemistry, *Water balance, *Reservoirs, *Salt balance, Water quality, Arid lands, Evaporation, Leaching, Seepage.
Identifiers: USSR, Otkaznenskiy Reservoir, Kuma River.

The morphometry, water balance, and chemical balance in the first year of the Otkaznenskiy Reservoir, USSR, are described. Systematic investigations of the hydrochemical regime of the reservoir were begun in April 1966. The year-round hydrochemical investigations included monthly observations of the elements of the salt balance of the reservoir (the supply of salts from the atmosphere, river and groundwater, and also the loss of salts by water discharge into the lower pool, seepage through the dam body, etc.). Before the reservoir was filled in July 1965, a soil survey was made of its bed and water extracts were analyzed to establish soil salinity and its effect on the salt balance of the reservoir. Before the reservoir was built, the mineralization of the Kuma River fluctuated from 600 to 1700 mg/liter in the course of a year. The range of variations in the mineralization of the reservoir is less broad, 800-1500 mg/liter. The chemical composition of the river water was sulfatic over most of the year, except during summer floods, when the bicarbonate ion predominated in the anion composition. The Ca, Na + K ions predominated in the cation composition. The chemical composition of the reservoir water is of sodium-sulfate type. The hydrochemical regime of the Kuma River changed from a Na-Ca-K sulfate to a predominantly Na-sulfate type as a result of its regulation by the Otkaznenskiy Reservoir in the first year of its existence. The salt balance of the reservoir shows as its main elements the supply of salts from river flow (88%) and the discharge of salts into the lower pool of the reservoir (70%). Such elements as the supply of salts from the reservoir bed (6.0%) and their removal with seepage water (20.7%) are also important in the first year of existence of a reservoir. (Knapp-USGS)

OBSERVATIONS ON ACTIVITY AND DIFFUSION COEFFICIENTS IN NA-MONTMORILLONITE,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
P. F. Low.
Research supported by a grant from the Div of Agr Development, Tennessee Valley Authority. Israel Journal of Chemistry, Vol 6, p 325-336, 1968. 12 p, 7 fig, 4 tab, 15 ref.

Descriptors: *Clay minerals, *Montmorillonite, *Ion transport, *Diffusion, Viscosity, Porosity, Water chemistry, Mineralogy, Clays.
Identifiers: Clay-water systems.

Double-layer theory was used to obtain the distribution of electrical potential between adjacent clay particles. From this distribution, the activity coefficients of the sodium and chloride ions in the system were calculated. The porosity of the clay-water system was calculated from the density and

ıcentration of clay, and the calculated value was ed to calculate the geometry factor. This factor d the diffusion coefficient of water in bulkwater re used to calculate the diffusion that water uld have in the clay if the water therein had its rmal viscosity. The water in the clay was about ce as viscous as normal water. It was possible to mpute the diffusion coefficients that Na and Cl uld have in the absence of electrical interaction h the clay. To obtain closer agreement, electri- field strengths calculated by double-layer ory were used in an empirical equation relating cosity and field strength to obtain the distribu- n of viscosity relative to the particle surfaces. so, double-layer theory was used to obtain ionic tributions with respect to these surfaces. From resulting distributions it was possible to deter- ne, the ionic diffusion coefficients that should tain in the clay system. (Knapp-USGS)

DROCARBONS IN THERMAL AREAS, RTHWESTERN WYOMING,
ological Survey, Washington, D.C., and Na- nal Park Service, Washington, D.C.
D. Love, and John M. Good.
r sale by Superintendent of Documents, U S vernment Printing Office, Wash, D C 20302 - ce $0.40 (paper cover). U S Geological Survey ofessional Paper 644-B, P B1-B23, 1970. 23 p, fig, 1 tab, 36 ref.

scriptors: *Thermal springs, *Distillation, *Oily ter, *Wyoming, Hot springs, Thermal water, eam, Organic matter, Sedimentary rocks, Bitu- nous materials.
entifiers: Hydrocarbons, Yellowstone National rk.

ve natural occurrences of hydrocarbons in ther- l areas lie in an arcuate southeastward-to east- rd-trending area 70 miles long in northwestern yoming. The westernmost three are in Yel- wstone National Park. All are associated with undant sulfur and thermal springs and vents. ur are surrounded and underlain by volcanic cks, which range in age from Eocene to eistocene. The fifth emerges from Paleozoic ata. The source of the hydrocarbons could be leozoic or Mesozoic sedimentary rocks that un- rlie the surficial volcanics, but at Rainbow rings the oil might have been distilled from eistocene nonmarine algae at shallow depth. Sul- r isotope analyses do not indicate conclusively nether the sulfur is of igneous or bacteriogenic igin. In at least two of the localities, hot water d steam that derive their heat from an igneous urce below the sediments are believed to relate rectly to the extraction of the hydrocarbons, ansport upward along conduits, and extrusion on e surface. LEMENTAL SULFUR IN EDDY COUNTY, EW MEXICO,
eological Survey, Washington, D.C.
m S. Hinds, and Richard R. Cunningham.
vailable free on application to the US Geological rvey, Wash, DC, 20242. US Geological Survey ircular 628, 1970. 13 p, 4 fig, 10 ref.

escriptors: *Sulfur, *New Mexico, *Water emistry, Reduction (Chemical), Hydrogen sul- de, Sulfates, Gypsum, Water circulation, Ground- ater, Chemical reactions, Carbonate rocks, roundwater movement.
dentifiers: Eddy County (N. Mex).

ulfur has been reported in Eddy County, N. Mex., rocks ranging from Silurian to Holocene in age at epths of 0-15,020 feet. Most of the reported sulfur ccurrences are in the Abo, Yeso, and San Andres ormations and the Artesia Group. Sulfur deposi- on in the dense dolomites of the Abo, Yeso, and an Andres Formations is attributed to the reduc- on of ionic sulfate by hydrogen sulfide in forma- on waters in zones of preexisting porosity and permeability. A similar origin accounts for most of the sulfur deposits in the formations of the Artesia Group, but some of the sulfur in these formations may have originated in place through the alteration of anhydrite to carbonate and sulfur by the metabolic processes of bacteria in the presence of hydrocarbons. Sulfur deposits in the Castile Formation are found in irregular masses of cavernous brecciated secondary carbonated rock enveloped by impermeable anhydrite. Formation of carbonate rock and sulfur in the castiles is attributed to the reduction of brecciated anhydrite by bacteria and hydrocarbons in the same process ascribed to the formation of carbonate and sulfur in the caprocks of salt domes. CHEMICAL HYDROLOGY OF REGIONS OF EAST ANTARCTICA,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR).
A. A. Matveev.
Journal of Geophysical Research, Vol 75, No 18, p 3686-3690, June 20, 1970. 5 p, 4 tab, 4 ref.

Descriptors: *Chemistry of precipitation, *Antarctic, Ice, Snow, Sampling, Data collections, Water chemistry, Precipitation (Atmospheric), Runoff, Ablation.
Identifiers: USSR.

Samples of atmospheric precipitation, snow, and ice were collected during the IGY in East Antarctica. The chemical composition of the precipitation and of the snow and ice cover is influenced by the relief and climatic features of the antarctic continent. Three distinctive zones can be identified in East Antarctica: the coastal strip, the oasis, and the inland region. The main feature of the chemical hydrology of the coastal strip is its comparatively high concentration of substances in precipitation, which ranged from 3.3 to 260.8 mg/l. The composition of atmospheric precipitation in this zone is influenced by the ocean. The relation of changes in the concentration of precipitation constituents to the dynamics of air masses over the region of observation, as well as to position of the drifting ice edge, was investigated. Precipitation in the ice-free surface area of the Antarctic oasis region is characterized by a predominance of HCO3, Na, K, and CA ions. Fluctuations in the snow mineralization are 1 to 4 mg/l in this zone. Snow differs from that of the coastal strip by variations in ion concentrations. Calculation of the chemical ice runoff showed some excess in the accumulation of salts by precipitation over runoff. (Knapp-USGS)

CHEMICAL CHARACTERISTICS OF WATER MASSES IN THE AMERASIAN BASIN OF THE ARCTIC OCEAN,
Alaska Univ., College. Inst. of Marine Science.
Patrick Kinney, Martin E. Arhelger, and David C. Burrell.
Journal of Geophysical Research, Vol 75, No 21, p 4097-4104, July 20, 1970. 8 p, 12 fig, 20 ref. ONR Contract N000 14-67-A-3017-0001.

Descriptors: *Water chemistry, *Arctic ocean, *Ocean circulation, Water temperature, Salinity, Dissolved oxygen, Nutrients, Density, Density stratification, Thermal stratification, Mixing, Advection, Oxidation, Ocean currents, Oceanography.
Identifiers: Amerasian basin.

Detailed vertical profiles of hydrographic data and routine chemical parameters (oxygen, nutrients) were taken in the Amerasian basin of the Arctic Ocean and in the Bering Strait and Chukchi Sea. Correlations of these chemical profiles with water mass sources and mixing processes are postulated. The water of the sharp temperature maximum at about 75-meter depth is chemically a mixture of the arctic surface water and core water from about 160 meters. This core water corresponds to the temperature minimum and nutrient maximum and is of Bering Strait-Chukchi Sea origin. The temperature maximum and minimum simply reflect differing thermal regims existing in the Chukchi. Extremely close vertical sampling has shown intriguing detail in the oxygen, temperature, salinity, and nutrient profiles in the area of the very sharp oxygen minimum occuring at about 205 meters. Temperature-salinity and chemical plots of the close-interval data identify a core of water at approximately 230 meters that is mixing above with Bering core water at 160 meters and below with the Atlantic core water at about 500 meters. Thus the oxygen minimum appears to be at least partly due to advection of shelf water into the basin rather than to in situ oxidation alone. (Knapp-USGS)

LEAD IN A SUBURBAN ENVIRONMENT,
P. R. Atkins.
Journal Air Pollution Control Association, Vol 19, No 8, p 591-594, August 1969. 4 p, 14 ref.

Descriptors: *Air pollution, *Heavy metals, *Fallout, *Urbanization, Highway effects, Raindrops, Nucleation, Sediments, Particle size.
Identifiers: *Lead fallout, Highway traffic, Pollution source.

The lead content of air, rainfall, and dry fallout samples taken at several sites in Palo Alto, California are reported and discussed. Major source of lead pollution apparently is the high-speed, high-density freeway traffic in the area. The natural atmospheric cleansing processes of sedimentation and raindrop scavenging remove large quantities of lead particulate matter. Nucleation probably occurs on the submicronic lead compound particles in exhaust streams, making droplets which impact on the larger airborne particles. This could explain the wide size distributions range reported in the literature as well as the large amounts of lead found in the samples analyzed. (Lang-USGS)

DISSOLVED SOLIDS-DISCHARGE RELATIONSHIPS: 1. MIXING MODELS,
New Hampshire Univ., Durham.
Francis R. Hall.
Water Resources Research, Vol 6, No 3, p 845-850, June 1970. 6 p, 1 fig, 7 ref. OWRR A-002 NH.

Descriptors: *Water quality, *Streamflow, *Dissolved solids, *Mathematical models, Aqueous solutions, Solutes, Mixing, Leaching, Dispersion, Diffusion, Discharge (Water).
Identifiers: Discharge-dissolved solids relationships, Mixing models.

A reasonable basis is needed for the selection of models to aid in analyzing the relationships between dissolved constituents and discharge in streams. A series of simple mixing models based on mass balance calculations is presented along with derivations and solutions for assumptions about the mixing volumes and the storage volume-discharge relationship. If concentration and discharge data show a hysteresis or loop relationship with time, then the commonly assumed direct relationship between total volume of water in the stream channel and stream discharge is probably not valid. The relationship of the constants in the derived equations to physical or chemical factors is masked at the present time by the nature of the initial assumptions and the method of derivation. A GEOCHEMICAL DRAINAGE SURVEY IN CENTRAL ECUADOR,
Kennecott Exploration del Ecuador, Quito; and Proyecto Minero, Quito (Ecuador).
Tjepke P. Kroon, and Ann de Grys.
Economic Geology, Vol 65, No 5, p 557-563, August 1970. 7 p, 3 fig, 3 ref.

Descriptors: *Surveys, *Geochemistry, *Exploration, *Trace elements, Water chemistry, Surface waters, Runoff, Streamflow, Leaching, Sediments, Mineralogy, Solutes, Sampling.
Identifiers: Ecuador.

A reconnaissance drainage sediment survey was carried out over 10,000 sq km in the Cordilleras of Central Ecuador. Long dispersion trains of zinc extend over several kilometers and are associated with shorter trains of Pb, As, Ag, Sb and Bi. These metals are derived from epithermal deposits containing galena, sphalerite, arsenopyrite and Ag-Sb-Bi sulfides. Very pronounced copper-molybdenum anomalies could be traced over long distances in streams of a major drainage basin. The anomalies were derived from the copper-molybdenum porphyry occurrence at Chaucha. Copper-zinc anomalies of moderate length derive from the oxidation of disseminated pyrite in andesitic volcanics. Zinc anomalies extend for 1-2 km in streams originating in the poorly drained highlands, or 'paramo.' Polymetallic anomalies of Cu, Zn, Mo, V, Ni, Co, and As are found in streams draining an area of black shales. (Knapp-USGS)

HYDROCHEMICAL CHARACTERISTICS OF SMALL RESERVOIRS IN SOME DISTRICTS OF THE CENTRAL CHERNOZEM PROVINCES,
I. Ya. Degopik.
Translated from Russian. In: Water Balance and Silting of Small Reservoirs in the Central Chernozem of the Russian Soviet Federal Socialist Republic, p 166-186, 1967. 21 p, 3 fig, 3 tab, 17 ref.

Descriptors: *Hydrologic aspects, *Hydrologic data, Chemical properties, *Reservoirs, *Ponds, Chernozems, Limnology, Silting, Reservoir silting, Rivers, Forests, Geology, Runoff, Seasonal, Gases, Carbon dioxide, Vegetation, Water chemistry, Bicarbonates, Chemical analysis.
Identifiers: *USSR, Chernozem Provinces.

Hydrochemical characteristics of the small ponds and reservoirs of Kursk Province, USSR were recorded and analyzed during 1956-1960. In general, the content of dissolved gases in the pond waters is subject to large variations, and the waters in the first years of their existence are characterized by absorption of dissolved oxygen and by a simultaneous increase in the content of carbon dioxide. The extreme values of mineralization are 62 and 646 mg/liter with the greatest number of investigated ponds having a narrow range of mineralization (150 to 250 mg/liter). The mineralization of ponds fed by groundwater does not reach high values and, on the average, does not exceed 400 mg/liter. (See also W70-09312). (Gabriel-USGS)

TWO LAYER MODEL OF STRATIFIED FLOW IN AN ESTUARY,
Waterloopkundig Laboratorium, Delft (Netherlands).
C. B. Vreugdenhil.
La Houille Blanche, No. 1, 1970, p35-40, 9 fig, 3 tab, 12 ref.

Descriptors: *Density stratification, *Mathematical model, Saline water, Freshwater interfaces, Numerical analysis, Estuarines, Tidal effects, Velocity, Continuity equation, Water waves.
Identifiers: Rotterdam waterways, Boundary conditions, Interfacial friction.

A mathematical model was developed and computations were verified by means of prototype data from the Rotterdam Waterway of 1956. The data for computation included case A (with tidal computation) and case B (without tidal computation). By comparison of case A and case B, it was concluded that the horizontal tide is the main factor influencing the salt wedge. It was noticed that the vertical tide was 2 hours late in case B. A second important factor is the seaward boundary condition for the internal flow and the essential processes of supercritical in and outflow should be included. The evaluation of the correspondence between measurements and computations depends on the required accuracy. Results showed a reasonable reproduction of the layer-thickness and velocities. The method is considered to be useful for many practical purposes. Essentially, the value of the two-layer model is determined by the empirical parameter k (coefficient of interfacial friction) which can be estimated depending on the overall conditions of the estuary. ESTUARY ENTRANCE, UMPQUA RIVER, OREGON; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
G. M. Fisackerly.
Sponsored by U.S. Army Engineer District, Portland. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-6, May 1970. 20 p, 3 tab, 83 photo, 177 pl.

Descriptors: *Estuaries, *Hydraulic models, Shoals, Channel improvement, Jetties, Currents (Water), Oregon.
Identifiers: *Umpqua River, Navigation conditions.

Model was of fixed-bed type, constructed to scales of 1:300 horizontally and 1:100 vertically, reproducing the lower 28 miles of Umpqua River and an adjoining portion of the Pacific Ocean. Purpose of model study was to determine optimum plan for the reduction of shoaling and elimination of crosscurrents in the navigation channel at the entrance. Model verification tests indicated that the model hydraulic and salinity regimens were in satisfactory agreement with those of the prototype for comparable conditions, and therefore model provided quantitative answers concerning the effects of the proposed plans on the hydraulic and salinity regimens of the estuary. Optimum plan consisted of existing conditions plus a 2600-ft extension of the training jetty to the outer end of the south jetty. Results of model tests indicate that the optimum plan eliminated the crosscurrents without aggravating the wave climate or shoaling conditions. (Spivey-Waterways Experiment Station)

Descriptors: *Sedimentation, *Tidal waters, *Tidal effects, *Currents (Water), *Deposition (Sediments), Marine geology, Tides, Sedimentary structures, Sedimentation rates, Sediment transport.
Identifiers: Tidal currents.

Reliance on the commonly expressed assumption that fine-grained sediment is deposited from tidal systems only at slack tide is found to give rates of deposition much lower than those actually found in the German Bight. A model of quasi-continuous deposition is formulated with the assumption that the viscous sublayer of the turbulent boundary layer accepts sediment by settling but does not eject it back into the main flow. This model is only valid at low shear values (less than 1.2 cm/sec). Recent studies of the nature of the viscous sublayer have shown that it is periodically disrupted with fluid ejection as the result. There is a slight excess of ejection over input for sediment, and rates of deposition by the quasi-continuous model will be somewhat too high. Application of these models to mud layers in tidal deposited sands and in flaser bedding shows that these layers cannot be produced during slack tide. The time is too short and suspended sediment concentrations are too low. These layers must represent some periodicity other than that of tides, possibly that of storm and calm conditions. A SUMMARY OF PRELIMINARY STUDIES OF SEDIMENTATION AND HYDROLOGY IN BOLINAS LAGOON, MARIN COUNTY, CALIFORNIA,
Geological Survey, Washington, D.C.
J. R. Ritter.
US Geological Survey Circular 627, 1970. 22 p, 5 fig, 1 tab, 19 ref.

Descriptors: *Sedimentation, *Sediment transport, *Bays, *Lagoons, *California, Currents (Water), Sediment transport, Littoral drift, Water circulation, Particle size, Sands, Provenance.
Identifiers: Bolinas Lagoon (Calif).

The U.S. Geological Survey is investigating sedimentary and hydrologic conditions in Bolinas Lagoon, a 1,100-acre lagoon 15 miles northwest of San Francisco. Two series of measurements of suspended-sediment load and water discharge in Bolinas Lagoon inlet showed that much of the suspended sediment is sand and that the average velocity was as much as 4.7 feet per second. Littoral drift near the inlet was generally toward the inlet, whereas farther from the inlet the pattern is irregular. Circulation velocities in the lagoon decrease rapidly away from the inlet, but probably remain high enough to erode bottom sediment along the channels. In most of the lagoon median size of bottom sediment was fine sand. Sediment was derived chiefly from Monterey Shale. (Knapp-USGS)

COASTAL WETLANDS OF VIRGINIA-INTERIM REPORT,
Virginia Inst of Marine Science, Gloucester Point.
Marvin L. Wass, and Thomas D. Wright.
Virginia Institute of Marine Science Special Report in Applied Marine Science and Ocean Engineering No 10, December 1969. 154 p, 19 fig, 6 tab, 81 ref, append.

Descriptors: *Wetlands, *Virginia, *Surveys, *Land management, *Conservation, Wildlife conservation, Water law, Zoning, Legislation, Economics, Land resources, Fishing, Natural resources, Preservation, Scenery, Recreation.
Identifiers: Virginia coastal wetlands.

Coastal wetlands occupy only 1% of the total area of Virginia, and marshes occupy 1/2%. Yet 95% of Virginia's annual harvest of fish (commercial and sport) from tidal waters is dependent to some degree on wetlands. Wetland productivity ranges from very little on some small salt barrens to about 10 tons per acre per year in the best grass marshes. Productivity on the tidal flats, which apparently cover more area than does marsh on the Eastern Shore seaside is probably at least one-fourth that in the marsh. Virginia has not adopted a legal definition of wetlands. Such a definition is needed before protective legislation can be enacted. Preliminary economic evaluation of wetland productivity indicates that an average acre of wetland generates primary tangible benefits of $78/year. These benefits largely accrue to the public rather than to the wetland owner. Present wetland use and management is determined by the owner and often does not constitute the most beneficial use of the land to the public. To insure continuing high yields, to enhance value, and to serve the best public interests, it is recommended that the State acquire or otherwise exercise some degree of control over the uses and alterations of wetlands. ISOPACHOUS MAPPING OF THE LOWER PATUXENT ESTUARY SEDIMENTS BY CONTINUOUS SEISMIC PROFILING TECHNIQUES,
Naval Oceanographic Office, Washington, D.C. Coastal Oceanography Branch.
Newell T. Stiles, and Donald R. Wiesnet.
U S Naval Oceanographic Office Informal Report No IR 70-37, May 1970. 26 p, 11 fig, 1 tab, 21 ref.

Descriptors: *Profiles, *Bottom sediments, *Estuaries, *Sounding, Instrumentation, Mud, Sediments, Sedimentation, Channel morphology, Acoustics, Bathymetry, Surveys.
Identifiers: Patuxent Estuary.

The thickness and extent of the sediment cover in the Patuxent Estuary was determined using a high-frequency, high-spatial resolution, shallow-penetration, continuous seismic profiling system. The isopachous map provides the sub-bottom information required to determine optimum locations for placing test equipment on the river bottom. Mud filled depressions, acoustically transparent to 12-kHz sound pulses, occur mainly north of Half Pone Point, and east of the present river channel. Based on identification of first sub-bottom reflectors, these depressions are as much as 16 feet thick. The dominance of the thicker deposits east of the channel and evidence of a submerged terrace indicates that either the channel has migrated to the west, or that the channel of the Patuxent River at this location was larger in the past and has subsequently filled in much of the material on the eastern edge. Maximum penetration at the scarp of the submerged terrace was 36 feet beneath the water-sediment interface. (Knapp-USGS)

DESALTING COST CALCULATING PROCEDURES.
Southwest Research Inst., Houston, Tex.
W. L. Prehn, Jr., and J. L. McGaugh.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $1.25. US Office of Saline Water Research and Development Progress Report No 555, May 1970. 143 p, 50 fig, 2 tab, 74 ref, 8 append.

Descriptors: *Desalination plants, *Cost analysis, Cost comparisons, Construction costs, Maintenance costs, Operating costs, Water costs, Total costs, Water rates, Waste water disposal, Injection wells, Evaporation pans.
Identifiers: Desalination costs.

This report presents the results of a study and compilation of desalting cost calculating procedures by alternative desalting methods and related systems. The user may calculate, for cost comparison purposes, the capital costs and operating and maintenance costs for five desalting processes as a preliminary to a possible detailed engineering feasibility analysis. The five desalting processes are (1) electrodialysis (ED), (2) reverse osmosis (RO), (3) multistage flash distillation (MSF), (4) vapor compression-vertical tube evaporator-multistage flash distillation (VC-VTE-MSF), and (5) vacuum-freezing vapor-compression (VFVC). MANUAL ON SOLAR DISTILLATION OF SALINE WATER.
Battelle Memorial Inst., Columbus, Ohio.
S. G. Talbert, J. A. Eibling, and G. O. G. Lof.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $2.00. US Office of Saline Water Research and Development Progress Report No 546, Apr 1970. 263 p, 152 fig, 23 tab, 529 ref. OSW Contract No 14-01-0001-1695.

Descriptors: *Solar distillation, *Desalination processes, *Distillation, *Desalination apparatus, *Solar stills, Dropwise condensation, Heat transfer, Solar radiation, Evaporation, Water supply, Water costs, Saline water, Economics.
Identifiers: Solar desalination.

This manual, prepared under the sponsorship of the U.S. Office of Saline Water, is a comprehensive treatise on the state of the art of solar distillation. Its primary purposes are to apprise water-supply planners of the potential of solar distillation and to assist them in designing practical plants. Information for the manual was assembled from an extensive review of the literature and from correspondence and discussions with solar-still designers from various countries. An attempt was made to classify the various designs into recognizable categories in which there are realistic data and to present the kind of information that will assist solar-still designers in making logical choices of [illegible] for their particular situations. Solar distillation of salt water appears well suited to the supply of potable water to small communities where the natural supply of fresh water is inadequate or of poor quality, and where sunshine is [illegible]. The distilled water cost is between $3 and $4 per 1000 gallons. These water costs are generally lower than those associated with other desalination equipment in plant sizes of up to perhaps 50,000 gpd. (See also W70-09243) (Knapp-USGS)
W70-09244

FINAL REPORT ON REVERSE OSMOSIS MEMBRANES CONTAINING GRAPHITIC OXIDE.
Westinghouse Electric Corp., Pittsburgh, Pa.
E. S. Bober, L. C. Flowers, P. K. Lee, and D. E. Sestrich
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402. US Office of Saline Water Research and Development Progress Report No 544, May 1970. 116 p, 15 fig, 24 tab, 53 ref. OSW Contract No 14-01-0001-2154.

Descriptors: *Membranes, *Reverse osmosis, *Clay minerals, Semipermeable membranes, Permselective membranes, Laboratory tests, Bentonite, Membrane processes.
Identifiers: Graphitic oxide membranes.

Membranes formed from graphitic oxide (GO) and from bentonite clay were tested for reverse osmosis performance. GO membranes fabricated from a three year old batch of GO had essentially the same performance as those formed a year and a half earlier indicating that aging of the dispersions is not a problem. The mechanical strength of GO membranes was significantly improved by overcoating them with a layer of microcrystalline collagen (Avitene H) in coating weight ratios between 1 and 10 times the GO layer weight. Within this range of coating weight, no adverse effect was observed on the desalination performance of the GO. Use of collagen layers to sandwich the GO membrane, while further improving mechanical strength, adversely affected desalination performance. Standard six layer membranes exhibited salt rejection values of 94.2% and water flux of 0.55 gfd when used with 0.5% NaCl solution at feed pressures of 600 psi. A one layer membrane exhibited a salt rejection efficiency of 90.5% and a flux of 1.0 gfd. Usable ammonium bentonite membranes were fabricated by use of poly-anionic additives. All bentonite membranes, regardless of the polyvalent additive used, could achieve salt rejection efficiency values above 60%. (Knapp-USGS)
W70-09245

HYDROCASTING REVERSE OSMOSIS MEMBRANES.
Hydronautics, Inc., Laurel, Md.
R. Matz, M. P. Tulin, A. Gollan, H. S. Preiser, and H. Alcalay.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $1.25. US Office of Saline Water Research and Development Progress Report No 542, June 1970. 138 p, 34 fig, 16 tab, 17 ref, 3 append. OSW Contract No 14-01-0001-1727.

Descriptors: *Desalination apparatus, *Membranes, Desalination plants, Film, Membrane processes, Cellulose, Costs.
Identifiers: Membrane hydrocasting, Tubular membranes.

Hydrocasting provides a means for the in-situ formation of a tubular desalination membrane within a pre-assembled plant, flushing out the membrane as required, and regenerating fresh membrane surfaces, without dismantling the assembly and by techniques which may easily be automated. The support tube is filled with cellulose acetate casting solution prepared conventionally, and is forced through the system under pressure by means of an air or a gas column, thus forming an annular film of the solution on the wall of the support tube. Subsequently, the membrane may be heat-conditioned in-situ, by forcing hot water through the system for the required time. At no time should it be necessary to dismantle the plant for membrane replacement, and for plants of sufficiently large capacity, the membrane forming system could be an integral part of the plant. A desalting plant utilizing the hydrocasting process was conceived and subjected to an engineering and economic analysis. (Knapp-USGS)
W70-09246

A METHOD FOR THE EVALUATION OF THE SYSTEM AND COST EFFECTIVENESS OF LARGE SEA WATER DISTILLATION PLANTS,
Planning Research Corp., McLean, Va.
Albert Brown.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402 - Price $1.00. US Office of Saline Water Research and Development Progress Report No 539, Mar 1970. 100 p, 10 fig, 12 tab, 14 ref, 3 append. OSW Contract No 14-01-0001-1453.

Descriptors: *Desalination plants, *Flash distillation, *Cost analysis, *Systems analysis, *Computer programs, Mathematical models, Value engineering, Design, Maintenance, Maintenance costs, Operations.
Identifiers: *Cost-effectiveness analysis.

A method was developed for prediction of average distillation plant-effectiveness for each year of plant life, and for analysis of cost-effectiveness of variations in design concept and in maintenance procedures. Using the total cost of a variation and the associated plant-effectiveness, the variation which will result in reduced product water cost can be singled out by cost-effectiveness analysis. An Effectiveness Model was developed as well as a method for cost-effectiveness analysis. The Effectiveness Model embodies equipment performance characteristics and process thermodynamics for determination of overall desalting plant system-effectiveness. Subsystem-effectiveness is treated using general probability distributions of time-to-failure and repair duration for components. The computer program which was developed treats parametrically, the specific distribution functions which adequately describe the failure and repair duration processes for the equipment under consideration. In order to demonstrate the methodology, the Effectiveness Model was used and cost-effectiveness analysis was performed on both the multistage-flash and combined-vertical-tube-flash processes and plant designs. (Knapp-USGS)
W70-09247

IMPROVEMENT OF TUBULAR CELLULOSE ACETATE MEMBRANES BY FEED ADDITIVES.
Philco-Ford Corp., Newport Beach, Calif.
Wayne J. Subcasky
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402. US Office of Saline Water Research and Development Progress Report No 532, June 1970. 96 p, 35 fig, 21 tab, 13 ref. OSW Contract No 14-01-0001-2201.

Descriptors: *Reverse osmosis, *Membrane processes, *Surfactants, Permselective membranes, Ion transport, Laboratory tests, Semipermeable membranes, Permeability.
Identifiers: Membrane improvement.

An investigation was made of the effectiveness of surface active agents as feed additives to improve membrane performance in terms of salt and urea rejection. Surfactant variables studied included charged and uncharged types, concentration, nature of the hydrophilic and hydrophobic groups, hydrophilic to hydrophobic ratio, molecular weight, and molecular arrangement of the hydrophilic and hydrophobic groups within the molecule. Poly (vinyl methyl ether) in the 50 to 100 ppm concentration range was an effective feed additive for improving the rejection of both NaCl and urea. For NaCl-containing feed solutions, improvements in salt reduction from 4 to 34% or in product flux from 8 to 18% were achieved. For a series of

oxyethylene-nonylphenols, additive effective- was found to depend markedly upon the rophilicity of the additive. A cationic surfactant he quaternary ammonium salt type gave im- ements in excess of 400% in salt reduction or rovements greater than 140% in product flux NaCl-containing feed solutions. A proposed el for feed additives is presented in which in- ction of the hydrophilic groups of the additive water decreases the ability of water to solvate dissolved species in the feed solution. ERVISION, CONSTRUCTION AND ALUATION OF A SEA WATER DESULFAT- PROCESS PILOT PLANT,
alytic, Inc., Philadelphia, Pa.
. Ennis, and Gideon Gelblum.
sale by the Superintendent of Documents, U S ernment Printing Office, Washington, DC 02 - Price $0.50. U S Office of Saline Water earch and Development Progress Report No , March 1970. 40 p, 4 plate, 3 tab, 7 ref. OSW tract No 14-01-0001-2123.

criptors: *Descaling, *Desalination plants, stillation, *Sea water, *Sulfates, Ion exchange, ne water, Gypsum, Calcium sulfate, Scaling, er chemistry, Resins.
ntifiers: Barium.

noval of sulfates should resolve most of the blems of high temperature scale formation in illation desalination plants. A pilot sea water ulfating plant consists of two sections: a ulfating ion exchange cycle and a desulfating duct recovery section. Raw sea water can be fed ctly into the desulfating reactors or can be first arbonated and then desulfated. Ion exchange n in barium form is conveyed from the enerated resin surge bin, and fed into the first ium Exchanger. Aided by agitation, the resin is tacted by the sea water. By controlling the ratio ea water to resin, a slight excess of barium ion is ntained in solution, causing precipitation of ium sulfate to take place in the sea water. The n is thus converted to the sodium form. The ex- sted resin recovered at the primary screen is ed with process water and rescreened by the ondary Screen to be separated from the rinse er. It is then conveyed to the barium loading eration. (Knapp-USGS)

SIGN AND CONSTRUCTION SYSTEM FOR E DETERMINATION OF TRANSPORT AND MPACTION COEFFICIENTS OF REVERSE MOSIS MEMBRANES,
dronautics, Inc., Laurel, Md.
Matz, and R. E. Kohl.
r sale by the Superintendent of Documents, U S vernment Printing Office, Washington, DC 402 - Price $1.50. In: Hydrodynamic Aspects of salination by Reverse Osmosis, Part 1: U S Of- e of Saline Water Research and Development gress Report No 543, p 1-39, June 1970. 39 p, fig, 4 tab, 7 ref. OSW Contract No 14-01-0001- 05.

scriptors: *Desalination apparatus, *Reverse os- sis, *Permselective membranes, *Ion transport, aboratory tests, Permeability, Hydrodynamics, mosis, Semipermeable membranes.
ntifiers: Membrane hydrodynamics.

embrane transport coefficients are related to the enomenological coefficients which relate the w of water and solute through membranes under e influence of driving potentials across the mem- anes. At least three coefficients are required to aracterize membranes and these, derived from eoretical analyses, are assumed to be indepen- nt of fluxes and driving potentials. In the case of verse osmosis membranes, the three transport efficients are: the filtration coefficient, (L sub P) e reflection coefficient, and the solute permea- bility coefficient. The existence of compaction effects has been known for some time. A tentative analysis of the problem was made in which the effect was assumed to be confined to the porous backing. The effect of the reduction in void ratio which results is an increased resistance to flow and a decreased permeability to the diffusion of salt. A characterization or membrane-testing system designed using these considerations is described and shown diagrammatically. (See also W70-09357) (Knapp-USGS)

THE DETERMINATION OF THE TRANSPORT COEFFICIENTS OF CELLULOSE ACETATE MEMBRANES,
Hydronautics, Inc., Laurel, Md.
R. Matz, and C. Elata.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, DC 20402 - Price $1.50. In: Hydrodynamic Aspects of Desalination by Reverse Osmosis, Part 2: U S Office of Saline Water Research and Development. Progress Report No 543, p 40-93, June 1970. 54 p, 18 fig, 13 tab, 12 ref. OSW Contract No 14-01-001-1305.

Descriptors: *Desalination apparatus, *Reverse osmosis, *Membrane processes, *Hydraulics, *Ion transport, *Permeability, Osmosis, Permselective membranes, Semipermeable membranes, Hydrodynamics, Compaction.
Identifiers: *Membrane compaction, Membrane hydrodynamics.

Transport coefficients of anisotropic cellulose acetate membranes of the Loeb-Sourirajan type were determined by using two independent methods of the transport coefficients of the membranes and the subcoefficients for each of the two layers (dense and porous) of which they are composed. Values for the various coefficients are tabulated and related to membrane heat-treatment. Most of the membranes studied were made from a uniform and constant casting solution, and no other membrane systems were studied. Dense layer permeabilities are relatively constant for membranes of the same heat treatment, even after prolonged pressurization. The permeability of the dense layer is significantly pressure related in short period tests made after an initial-set period during which the major initial compaction of the porous layer occurs. Hydrostatic permeabilities are substantially larger than permeabilities measured by osmotic means. This can only be attributable to internal polarization at the dense-porous layer interface, and there is some evidence to confirm this conclusion. (See also W70-09358) (Knapp-USGS)
W70-09357

A COMPACTION THEORY FOR MODIFIED REVERSE OSMOSIS MEMBRANES,
Hydronautics Inc., Laurel, Md.
C. Elata.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, DC 20402 - Price $1.50. In: Hydrodynamic Aspects of Desalination by Reverse Osmosis, Part 3: U S Office of Saline Water Research and Development Progress Report No 543, p 94-111, June 1970. 18 p, 3 fig, 1 tab, 9 ref. OSW Contract 14-01-001-1305.

Descriptors: *Desalination apparatus, *Reverse Osmosis, *Membrane processes, *Permeability, *Permselective membranes, Hydraulics, Hydrodynamics, Ion transport, Semipermeable membranes, Diffusivity, Laboratory tests, Compaction.
Identifiers: *Membrane compaction.

Compaction of modified Reverse Osmosis membranes reduces the water permeability of modified membranes under pressure with time. While it was found that both the rejection and the salt diffusivity remain approximately constant with time, the water permeability may decrease significantly. Experimental evidence indicates that plastic deformation or creep occurs during compaction and bears the major responsibility. A general equation for the compaction effect was derived. The analysis leads to a complicated semiempirical expression which may be approximated by a simple log-log relationship. (See also W70-09359) (Knapp-USGS)
W70-09358

COMPACTION OF CELLULOSE ACETATE MEMBRANES,
Hydronautics, Inc., Laurel, Md.
R. Matz.
For sale by the Superintendent of Documents, U S Government Printing Office, Washington, DC 20402 - Price $1.50. In: Hydrodynamic Aspects of Desalination by Reverse Osmosis, Part 4: U S Office of Saline Water Research and Development. Progress Report No 543, p 112-157, June 1970. 46 p, 21 fig, 5 tab. OSW Contract No 14-01-0001-1305.

Descriptors: *Desalination apparatus, *Reverse osmosis, *Membrane processes, *Permeability, *Permselective membranes, Laboratory tests, Hydraulics, Hydrodynamics, Ion transport, Semipermeable membranes, Diffusivity, Compaction.
Identifiers: *Membrane compaction.

A model was established for reverse osmosis membrane compaction as a function of time, pressure, and membrane permeabilities, based on analogous flux of water through packed clay beds. Experimental runs with membranes under pressure show that anomalous flow conditions occur at the very beginning of the tests, and steady conditions are achieved after some time, varying from 10 mins. to over 3 hours. Thereafter, the flow behavior under constant pressure load is typical and reasonably reproducible for different membranes prepared under the same conditions. It is not unlikely that anomalous behavior can be attributed to flawed membranes. It seems likely that there is an initial compression of the membrane resulting in the expulsion of water from the porous part of the membrane, followed by a much slower recovery which is nevertheless accompanied by positive flow. The subsequent increase in flow rate could be attributable to a rapid initial compaction resulting in further expulsion of water from within the membrane porous layer before the final steady state compaction is achieved. Variations in membrane thickness with time were plotted and appear to confirm this, and that the bulk of the compaction occurs very shortly after the application of pressure. DEVELOPMENT OF REVERSE OSMOSIS MEMBRANES,
Universal Water Corp., Del Mar, Calif.
S. Manjikian, S. Liu, M. Foley, C. Allen, and B. Fabrick.
Available for sale by Superintendent of Documents, U S Government Printing Office, Wash, DC 20402 - Price $1.00. U S Office Saline Water Research and Development Progress Report No 534, June 1970. 90 p, 19 fig, 20 tab, append. OSW Contract No 14-01-0001-2093.

Descriptors: *Membranes, *Reverse osmosis, *Cellulose, Desalination processes, Thin films, Permselective membranes, Semipermeable membranes, Laboratory tests, Membrane processes.
Identifiers: Cellulose acetate butyrate.

Ultraselective membranes having adequate flux were produced from cellulose acetate butyrate as a film base. Salt rejection of 99.8% at a flux of 8-10 gal/sq ft day was achieved treating feed water of 5000 ppm NaCl at 600 psig. Using sea water as feed and an operating pressure of 1000 psig, a 99.7% rejection of total dissolved solids was achieved at a flux of 5 gal/sq ft day. These operating characteristics were obtained without heat treating the membrane. Proper choice of solvents and additives is a critical factor in the preparation of cellulose acetate butyrate membranes. Best results have been obtained using acetone as the principal solvent and triethyl phosphate as a modifying solvent with a combination of glycerol and n-propanol as a flux promoting additive. (Knapp-USGS)

ENGINEERING AND ECONOMIC EVALUATION STUDY OF REVERSE OSMOSIS,
Kaiser Engineers, Oakland, Calif.
F. L. Harris, G. B. Humphreys, H. Isakari, and G. Reynolds.
For sale by Superintendent of Documents, U S Government Printing Office, Wash, DC 20402 - Price $3.75. U S Office of Saline Water Research and Development Progress Report No 509, December 1969. 506 p, 66 fig, 92 tab, 61 ref, 7 append. OSW Contract No 14-01-0001-1669.

Descriptors: *Desalination, *Reverse osmosis, *Water costs, *Economics, *Value engineering, Optimization, Mathematical models, Systems analysis, Cost analysis, Hydraulics, Fluid mechanics, Computer programs, Cost-benefit analysis.
Identifiers: Reverse osmosis costs.

A parametric engineering and economic analysis of the reverse osmosis process was performed in which water costs were examined for demineralizing feedwaters with salinities of 2000, 3000 and 5000 ppm in plant sizes of 1, 10 and 50 mgd capacity, product water recoveries of 50, 60 and 80%, and operating pressures of 400, 600 and 800 psi. Capital and operating costs were prepared using state-of-the-art technology for tubular plate-and-frame, spiral wound, and hollow fine fiber reverse osmosis plant design concepts. Mathematical models were prepared to represent the hydrodynamic characteristics of each design concept. These models, in conjunction with computer codes were used to optimize plant design and operating parameters. Plant capital and operating costs were also prepared on the basis of anticipated improvements in reverse osmosis technology. (Knapp-USGS)

EFFECTS OF FOREST CLEAR-FELLING ON THE STORM HYDROGRAPH,
Georgia Univ., Athens.
John D. Hewlett, and J. D. Helvey.
Water Resources Research, Vol 6, No 3, p 768-782, June 1970. 15 p, 7 fig, 2 tab, 10 ref.

Descriptors: *Storm runoff, *Rainfall-runoff relationships, *Floods, *Clear-cutting, *Forest management, Conservation, Forestry, Hydrograph analysis, Watershed management, Flood control, Land management, Soil conservation, Infiltration, Evapotranspiration.
Identifiers: Experimental watersheds.

Earlier speculation that evapotranspiration from forests and the consequent soil water deficits under forests are factors in the mitigation of flooding was verified by a paired watershed experiment. Mature hardwood forest on a 108-acre catchment in the southern Appalachians was clear-felled after an 18-year calibration period. No forest material was removed, and no overland flow (surface runoff) occurred. A statistical analysis of all major storm hydrographs before and after clearing revealed that after felling stormflow volume (quick flow) was significantly increased 11% overall, or 0.23 inch at the mean quick flow volume of 2.1 inches. Peak discharge increased slightly after felling (about 6 cfsm or 7% at the mean peak flow of 92 cfsm). Time to peak, recession time, and quick flow duration were tested to an accuracy within 10% of their mean values, but no treatment effect was detected. Quick flow increases due to felling ranged from 0 in small floods to 1.9 inches during a record 7-day flood sequence, a 22% increase over the total quick flow (8.7 inches) expected during that regional record flood. The effect of forest evapotranspiration on floodwater released by deep-soil slopes persists throughout the year, a result explainable the variable source area concept of runoff. (Knap USGS)

HYDROLOGICAL ANALYSIS OF VOLCAN TERRANE: LOWER BASIN OF THE R GRANDE DE SAN MIGUEL, EL SALVADOR,
Food and Agriculture Organization of the Unit Nations, Kingston (Jamaica).
David Wozab, and J. Roberto Jovel.
Bulletin International Association of Scienti Hydrology, Vol 15, No 2, p 47-66, June 1970. 20 7 fig, 6 tab.

Descriptors: *Hydrogeology, *Irrigation wat *Water supply, *Water balance, *Rainfall-runo relationships, Groundwater, Water levels, Wat yield, Rainfall, Infiltration, Recharge, Runoff, Ba flow, Igneous rocks, Aquifers.
Identifiers: *El Salvador.

Standard hydrological methods were used to eval ate the water resources of a volcanic area that co prises the Lower Basin of the Rio Grande de S Miguel, El Salvador. The lower San Miguel Bas consists of a faulted valley situated at the base o series of old and recent volcanoes bounding t valley on the East, a tuff block to the South, a consolidated volcanics (lahars) on the West a North. The valley fill consists of pyroclastics whi diminish in particle size with distance from the vo canoes in the southern portion; however, t pyroclastics may be interbedded with lake deposi A principal objective of the evaluation was to a sess the feasibility of irrigating 10,000 hectares the valley. Almost half of the annual precipitati infiltrates into the ground. Of this quantity, abo one third is accounted for by the existing hydrolog cal balance between recharge and depletion. T remainder moves from the valley to the San Migu River as groundwater runoff and, if retained, is su ficient in quantity to meet the full anticipated i rigation demand. (Knapp-USGS)

third of the world's land is dry and virtually unoc- upied, while half of the population is jammed into tenth of the land area. Mounting population pres- ure and the preference people seem to have for eserts indicate that the vast, warm dry areas of the orld would be attractive for human occupancy if ater and power needs were met. Since much arid nd lies near the sea, seawater desalination is a otential fresh water source when inexpensive al- ernate sources are not available. Cities and indus- ries can be developed along the ocean shore, ringing with them some agriculture for garden roduce. A more difficult question is the extent esalinated water can be used for irrigation in arid nds for producing staple foods. A preliminary tudy at Oak Ridge National Laboratory, Tenn, ealt with intensive year-round farming in deserts, ased on the use of distilled water in association ith clustering industries. Production costs for rice nd wheat are in the general area of recent grain rices, for water costs of around 35 to 20 cents per 000 gal, respectively. These water prices are ithin the estimated future cost range for desalted ater. Has 31 references. (USBR)

IGRATION OF SOLUBLE SALTS IN AN IR- IGATED FIELD IN RELATION TO RAINFALL ND IRRIGATION,
epartment of Agriculture, Lethbridge (Alberta). ater Resources Div.
. N. Graveland.
anadian Journal of Soil Science, Vol 50, No 1, p 3-45, Feb 1970. 2 fig, 3 ref.

escriptors: *Alkaline soils, *Salinity, *Soil water ovement, *Irrigation effects, *Rainfall, Irrigated nd, Irrigation programs, Irrigation practices, Ir- igation, Semiarid climates, Water table, Migra- ion, Soil moisture, Soil water, Saline soils, Salts, oil chemistry, Soil chemical properties, Precipita- ion (Atmospheric).
dentifiers: *Soluble salts, *Alberta (Canada), *Ir- igated agriculture.

An alkaline soil in a pasture near Vauxhall, Alberta Canada) was studied in an effort to determine the effects of rainfall and irrigation on salt migration. The soil was sampled once a week during the grow- ng season and then once every 10 days until Janua- ry. The fluctuating water table of the area was traced by reading an observation well in the center of the test plot at the time of each sampling. The amount of water applied in the 3 irrigations was recorded and a rainfall record was kept. Changes in the concentration of soluble salts were compared with water table levels, soil moisture content, and precipitation records. Soluble salt content varied over 100 percent during the growing season and was inversely related to moisture content. Caution is obviously required when sampling for salinity values during the growing season, because water application and evapotranspiration are then at a maximum. (Carr-Arizona)

Presents new concepts for beneficial use of a large part of the heat discharged from the exhausts of turbines of fossil fuel or nuclear power plants. Both urban and rural sites offer opportunities for applying low temperature heat to useful purposes. Waste steam or hot water from power plants, between 300 deg F to 380 deg F, can be competitive with present urban space heating sources, even if the power plant is 10 miles from the heat distribution point. In most cities in the United States, more waste heat can be used for cooling, (in absorbtion systems) during the crucial summer period than is needed in the winter for residential and commercial heating. The average reduction in waste heat disposal that could be attained in this manner in urban areas is estimated to be 60 per cent. Other uses of the waste heat are discussed, including heating and cooling of greenhouses and poultry houses, and heating of aquaculture ponds. Evaporation of waste water and distillation of brackish or salt water for potable water supply or irrigation uses is considered feasible, but costly at present. Steam storage tanks to provide power for buses and switch engines are considered technically and economically feasible. The use of 104 deg F irrigation water is being studied in Oregon on several experimental farms. Similar studies are underway at Washington State University. A study of installations of underground pipes heated with condenser discharge water to stimulate growth of crops is underway at Oregon State University. (Poertner)

EXPERIMENT IN THE LEACHING OF SALINE LAND IN SOUTHERN KAZAKHSTAN,
Ya. D. Kalinin.
Translated from Hydraulic Engineering and Reclamation (Gidrotekhnika i melioratsiya), No 8, p 66-75, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 201-209, 1969. 9 p, 2 fig, 8 tab, 7 ref.

Descriptors: *Leaching, *Saline soils, *Land reclamation, *Irrigation, Drainage, Irrigation effects, Irrigation practices, Salinity, Salt balance, Soil management.
Identifiers: *USSR, *Kazakhstan.

Saline lands in Kazakhstan were leached for the first time over a large area (1100 hectares) at state farm No. 1, located in the area of the Arys'-Turkestan irrigation system (northwestern part of Chimkent Province). The site of this irrigation system is between the gently sloping piedmont plain of the Kara-Tau Ridge and the old alluvial plain of the Syr-Dar'ya River. The elevations of this area are 200-240 m and the slopes, 0.001-0.006. The mean annual precipitation is 184-210 mm with a weak maximum in the winter-spring period. The mean annual air temperature is 12-12.7 deg C. The frost-free period lasts 195 days with a mean daily temperature sum of 4300 deg C. The average annual relative air humidity is 53% and evaporative power reaches 1500 mm per year. Prior to leaching, a salt survey was performed. It was found that of the total area of the irrigated area, 38.6% was saline, including 29.8% with soil salinity ranging from 0.7 to 3.0%. The permissible residual salinity after leaching was found to be 0.3-0.4% with allowance for the composition of the initial salts. Leaching removed 145,000 metric tons of salts (69%), including 29,300 metric tons of the chloride ion (96%), from the upper meter of the soil, originally containing 211,000 metric tons of salt. 3D. Conservation in Domestic and Municipal Use

CITY OF NEW YORK V NEW YORK WATER SERVICE CORP (CITY MAY ORDER AN INCREASE IN WATER SUPPLY).

274 NY 100, 8 NE2d 294-296 (1937).

Descriptors: *Water supply, *New York, *Cities, *Municipal water, Water demand, Water shortage, Waterworks, Water requirements, Administration, Legislation, Jurisdiction, Local governments, Planning, Water delivery, Water costs, Utilities, Administrative agencies, Judicial decisions, State governments, Remedies, Adjudication procedure, Legal aspects.
Identifiers: Mandamus.

Over a period of several years plaintiff city repeatedly directed defendant water supplier to install additional water mains so that a greater supply of water could be provided to a certain area of the city. Defendant failed to comply. Plaintiff applied to the court for a peremptory order of mandamus compelling the defendant to install the additional mains. The court held for plaintiff, stating that the state public service laws gave the city water commissioner authority to provide for an increase in water supplies. Mandamus was a proper remedy to require adherence to the order, and, in a serious situation such as a shortage of water no hearing was required before issuance of the order. (Hubener-Florida)

A TEST OF FEDERAL WATER PROJECT EVALUATION PROCEDURES WITH EMPHASIS ON REGIONAL INCOME AND ENVIRON-

MENTAL QUALITY: DETROIT RIVER, TRENTON NAVIGATION CHANNEL,
Michigan State Univ., East Lansing. Dept. of Agricultural Economics.
A. Allan Schmid, and William Ward.
Agricultural Economics Report No. 158, April 1970. 73 p, 10 tab, 3 plates, 1 append. Water Resources Council Agreement WRC69-6.

Descriptors: *Navigation, Industrial water, Leontief models, Cost-benefit analysis, Income analysis, Construction costs, Cost sharing decision making, Federal project policy, Federal budgets, Environmental effects.
Identifiers: *Water Resources Council Task Force Report, McLouth Steel Company, Detroit region, Lake Erie, Michigan Department of Conservation, US Army Corps of Engineers.

This report is an effort to apply the principles set forth by a Special Task Force of the U.S. Water Resources Council in their June 1969 report, Procedures for Evaluation of Water and Related Land Resource Projects. The Task Force encouraged potential effects to local incomes and to the environment from proposed water projects. In this study the proposed extension by the Army Corps of Engineers of the Trenton Channel which leads into the Detroit River in Michigan was examined. This project would enlarge the commercial navigational use of the channel and would thereby allow the McLouth Steel Company to develop a primary steel mill at Gibraltar, Michigan. The authors sought to determine how the actual costs and benefits of this project could be best predicted. Although their results were not conclusive, they stressed the need to study alternative locations and to view the proposed project in relation to the needs of other regions in the United States for navigational and industrial development. REDUCTION OF SEEPAGE LOSSES FROM IRRIGATION CANALS AS A RESULT OF SILTING,
Research Inst. for Water Resources Development, Budapest (Hungary).
F. Papfalvy, O. Starosolszky, and Z. Szigyarto.
13TH Congr Int Assn Hydraul Res, Proc Vol 4, p 299-309, Aug-Sept, 1969. 11 p, 7 fig, 5 ref.

Descriptors: *Seepage losses, Canals, *Irrigation canals, Observation wells, *Silting, *Permeability, Sealants, *Reduction, Boreholes, *Canal seepage, Seepage, Foreign research, Foreign design practices.
Identifiers: Hungary.

The irrigation canals built about 1960 in eastern Hungary are practically impervious up to a certain degree of fullness. Above the normal operating waterlevel, a sudden increase in seepage losses occurs, but decreases rapidly if the higher level is maintained for extended periods. Impermeability of the lower part of the canal cross section is caused by settling sediment, as demonstrated by soil mechanics tests and hydraulic investigations. The sealing effect of silting becomes observable in 1 to 2 yr. Silting as a stochastic process variable in time and space is described numerically in terms of soil type. (USBR)

HYDRAULIC DESIGN FOR CHECK METHOD OF IRRIGATION,
Punjab Agricultural Univ., Hissar (India).
V. V. N. Murty.
Journal of Agricultural Engineering Research, Vol 14, No 4, p 319-322, Dec 1969. 4 ref.

Descriptors: *Hydraulic design, *Irrigation design, *Flood irrigation, *Water loss, *Deep percolation, Soil water movement, Soil water, Soil moisture, Percolation, Irrigation water, Flow, Soils, Surface irrigation, Irrigation systems, Irrigation practices, Irrigation.
Identifiers: *Check irrigation.

The check method of irrigation, which consists of irrigating rectangular plots surrounded by levees, has not been as thoroughly studied as the border strip or the furrow methods. The check method is, nonetheless, widely used. An expression is derived to help determine the size of the check for given stream size and soil conditions and to estimate deep percolation losses under the given conditions. Losses depend on the time necessary to initially cover the entire plot with water and when required time decreases, losses decrease. The procedure for designing the check method of irrigation is illustrated with an example. (Carr-Arizona)

EFFECT OF SOIL PROFILE TYPE AND FERTILIZER ON MOISTURE USE BY WHEAT GROWN ON FALLOW OR STUBBLE LAND,
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
E. de Jong, and D. A. Rennie.
Canadian Journal of Soil Science, Vol 49, No 2, p 189-197, June 1969. 1 fig, 7 tab, 13 ref.

Descriptors: *Wheat, *Water utilization, *Slopes, *Fallowing, *Stubble mulching, Soil profiles, Crop production, Crop response, Soil moisture, Soil water, Water management (Applied), Fertilization, Semiarid climates, Great Plains, Soil-water-plant relationships, Precipitation (Atmospheric).
Identifiers: *Saskatchewan (Canada), *Slope position, *Water-use efficiency.

The effect on water utilization of fallowing, fertilizer use, and slope position was studied for wheat grown on the Canadian Prairies in the years 1960-1967. Yield, water consumption, and water-use efficiency of wheat grown on fallow land or stubble mulch varied according to whether the crop grew in a depression, on a lower slope, upper slope, or knoll. Although there were few significant differences between slope positions, yield and water-use efficiency showed a tendency to increase down the slope. Data also showed that, in general, yields increased linearly with water use. (Equations describing yield as a function of moisture use are illustrated.) Second-degree polynomials represented more realistic yield functions, but did not greatly increase the correlations. Growth of yield per cm of water used increased with fertilization and was greater on fallow than on stubble land. Mean yields for unfertilized stubble and fallow wheat were 1,340 and 1,500 kg/ha, respectively. For fertilized stubble and fallow wheat the figures were 1,720 and 1,860 kg/ha, respectively. ON USING A TIME VARIABLE INFILTRATION WITH THE ISRAELSON BORDER IRRIGATION EQUATION,
Saskatchewan Univ., Saskatoon. Dept. of Agricultural Engineering.
D. I. Norum.
Journal of Agricultural Engineering Research, Vol 14, No 2, p 173-175, June 1969. 3 fig, 5 ref.

Descriptors: *Equations, *Border irrigation, *Flow rates, *Infiltration, *Water flow, Flow, Time, Irrigation systems, Surface irrigation, Irrigation.
Identifiers: *Israelson border irrigation equation, *Rate of infiltration.

The author demonstrates why an equation for a time variable infiltration rate (I=ct superscript - 1/2) cannot be used in combination with the Israelson differential equation for flow down an irrigation border (qdt=Ixdt+hdx). When using specific values of c and h, such a method greatly overestimates distance x for given time t. Also, c is overestimated when working from field data to arrive at c and h. An exact solution to the infiltration-advance problem is presented. (Carr-Arizona)

BURLEY IRRIGATION DIST V ICKES (RIGHTS TO PROFIT FROM DAM OPERATION).

116 F2d 529-542 (DC Cir 1940).

Descriptors: *Idaho, *United States, *Irrigation districts, *Power operation and maintenance, Hydroelectric plants, Dams, Electric power production, Multiple-purpose projects, Irrigation, Governments, Irrigation operation and maintenance, Pumping plants, Economics, Prior appropriation, Irrigation programs, Water utilization, Water requirements, Operating costs, Power system operation, Net profit, Cost-benefit ratio, Judicial decisions, Legal aspects, Electric power demand, Federal reclamation law.

Plaintiff irrigation district and another district operated a dam for irrigation purposes with a secondary function of selling left-over power for commercial purposes. The United States owned the dam and had decreed that profits from the operation were to be distributed according to the proportionate usage of the water by plaintiff and the other district. Due to great seasonal variations in the amount of water used for irrigation, a continuous supply of power for commercial use could not be maintained, so defendant Secretary of the Interior contracted with a private power company for the needed extra power supply and sought to distribute part of the net profit to the private power company. Plaintiff sought to enjoin defendant from so distributing such profits. Plaintiff argued that this was an interference with its rights to part of the profit. The United States Court of Appeals for the District of Columbia ruled that the profits to be distributed did not stem directly from operation of the dam by plaintiff and that such contract with the private company was necessary to preserve the primary function of irrigation for which plaintiff's dam was designed. The court held that it was within defendant's discretion to allocate a portion of the profits to the power company. (Barker-Florida)

PADDY RATOONS,
nstitute of Agricultural Research, Addis Ababa (Ethiopia).
C. R. K. Prashar.
World Crops, Vol 22, No 3, p 145-147, May/June 1970. 9 tab, 2 fig, 3 ref.

Descriptors: *Crop response, Water utilization, Meteorological data, Water levels, Crop production.
Identifiers: *Paddy ratoons, (IR-8, IR-5), Institute of Agricultural Research, Melka Werer, Ethiopia.

This article provides data which demonstrates that growth of two varieties of rice (IR-8, IR-5) as paddy ratoons produces greater yields and uses less amounts of water than growth of rice as a main crop (first crop). The author tested various heights for ratooning and various dates for the first watering. Since the paddy ratoon matures in a shorter period of time than the main crop, it therefore uses less total water allowing for economy in irrigation. The author also points out that paddy ratooning offers the farmer labor saving advantages and at the same time can increase his rice yields considerably. (Holmes-Rutgers)

RESERVOIR LEAKAGE IN LIMESTONE TERRAINS,
Berlen C. Moneymaker.
Bull Assn Eng Geol, Vol 6, No 1, p 3-30, Spring 1969. 28 p, 6 fig, 5 ref.

Descriptors: Reservoir construction, *Reservoir leakage, *Reservoirs, *Reservoir sites, Seepage, Limestone, *Damsites, *Dam foundations, Grout curtains, *Engineering geology, Leakage, Grouting, Cutoff walls, Foundation rocks, Underseepage, Dams, History, Dam construction.
Identifiers: Reservoir modifications, Seepage control, Cavernous rock, *Solution channels, Hales Bar Dam, Tenn, Great Falls Dam, Tenn.

Constructing watertight reservoirs in limestone terrain may be difficult and costly. Limestone may contain solution cavities, joints, bedding planes, and other open structures that serve as leakage paths. Solution channels may occur along reservoir rims and below streambeds to depths of hundred of feet. Most reservoirs selected after adequate exploration can be made sufficiently watertight by proper foundation preparation and treatment and by rim-tightening programs. Experiences with leaking reservoirs of the TVA are reviewed. Hales Bar and Great Falls reservoirs in Tennessee developed leaks immediately after impoundment. In both instances, leakage began along solution cavities and accelerated rapidly as flowing water under hydrostatic head removed clay, silt, or sand from filled or partially filled cavities. Leakage from Hales Bar Reservoir occurred through subriver cavities beneath the dam. At Great Falls, leakage was through the rim along tubular cavities developed on bedding planes. The leakage control programs at Hales Bar and Great Falls are described. (USBR)

LEAKAGE THROUGH BURIED CHANNELS,
Howard A. Coombs.
Bull Assn Eng Geol, Vol 6, No 1, p 45-52, Spring 1969. 8 p, 5 fig.

Descriptors: *Reservoir leakage, *Leakage, Underground, Glaciers, Glacial deposits, Damsites, Channels, Freezing, Frozen ground, Rivers, Engineering geology, Glacial drift, Valleys, Geologic formations, Clays, Dams, Grout curtains, Drainage basins, Impervious blankets, Rockfill dams, Washington.
Identifiers: *Underground cavities, Glacial till, Sultan Dam No 1, Wash, Tolt River Dam, Wash, Buried channels (Geology).

Continental glaciers moved southward several times during the Pleistocene in the Puget Sound area of western Washington. At the same general time, alpine glaciers moving westward down the Cascade Range encountered the continental glaciers. The result was widespread disruption, diversion, and burial of previous drainage channels. These ancient buried drainage channels, existing along present riverbeds, can be the cause of reservoir leakage as dams are constructed. The Tolt River Dam, 30 mi east of Seattle, is in an entrenched river with andesite flows forming the bottom and glacial drift forming the sides of the valley. Leakage through the permeable glacial material in the old channel was sealed by an impervious blanket. At the Sultan Dam, 35 mi northeast of Seattle, the buried channel was filled with till forming an effective seal against leakage. Gorge Dam on the Skagit River presented a leakage problem only during construction. To prevent water from the old reservoir (400 ft upstream) from moving into the new deep excavation, a frozen subsurface seal 220 ft high was installed. Thorough exploration and imaginative methods of treatment of these buried channels may permit construction of many additional dams and reservoirs for future use. (USBR)

RESEARCH INTO THREE-DIMENSIONAL SEEPAGE IN JOINTED ROCK FOUNDATIONS OF HIGH DAMS.

13th Congr Int Assn Hydraul Res, Proc Vol 4, p 151-158, Aug-Sept 1969. 8 p, 6 fig, 14 ref.

Descriptors: Anisotropy, *Seepage, *Flow nets, *Underseepage, Models, *Dam foundations, *Model studies, Three-dimensional, Rock foundations, Flow characteristics, Percolation, Foreign research, Two-dimensional, Soil mechanics, *Electric analogs, Analog models.
Identifiers: Seepage control, USSR.

Theoretical justification and recommendations on methods of modeling using electrical analogy are presented for 3-dimensional percolation in an anisotropic medium. Specific reference is made to seepage through dam foundations. A procedure is suggested whereby 2-dimensional plan and elevation models constructed from electroconductive paper are used to determine an approximate grouting and drainage scheme and a 3-dimensional model is used for refining the approximate scheme. Model studies made for a dam are described and results presented. Problems of seepage in anisotropic media can be reduced to problems of seepage in isotropic media by distorting dimensions of individual model zones and by separate construction and mounting of models of rock masses having differently oriented joints. (USBR)

CROSBY V DE LAND SPECIAL DRAINAGE DIST (VALUE TO FARMLAND OF IMPROVED DRAINAGE SYSTEM).

367 Ill 462, 11 NE2d 937-942 (1937).

Descriptors: *Illinois, *Drainage districts, *Assessments, *Direct benefits, Tiles, Drainage systems, Ditches, Surface waters, Drains, Property values, Land appraisal, Market value, Productivity, Drainage water, Local governments, Tile drainage, Surface runoff, Judicial decisions, Taxes, Farms, Land tenure, Benefits, Estimated benefits, Adjudication procedure, Legal aspects.

Defendants, commissioners of a drainage district, planned to improve open drains in the district and made assessments against those lands which would receive benefits from the improvements. Plaintiffs, owners of assessed lands, claimed the assessments greatly exceeded the benefits which would accrue to their lands. The lower court heard conflicting testimony as to the need for the drainage improvement, its effects on the farmland, and its value to the land. The jury found for plaintiffs, returning a lower assessment on each tract of land. The Illinois supreme court affirmed, stating that the jury's finding was not against the weight of the evidence. The court stated that if the jury believed from a preponderance of the evidence that the assessments exceeded the benefits, it had a duty to lower the assessments. In considering the value of the improvements to the land it was proper for the jury to consider only the direct benefits of the improved drain and not a general rise in value of the property. DALY V STATE (FLOOD DAMAGES CAUSED BY CANAL CONSTRUCTION).
42 NE2d 14-15 (NY 1942).

Descriptors: *New York, *Flood damage, *Alteration of flow, *New York State Barge Canal canals, Construction, Crops, Streamflow, Natural flow, Floods, Canal design, Inland waterways, Navigation, Operation and maintenance, Judicial decisions, Legal aspects, Damages, Streams, Overflow, Watercourses (Legal).
Identifiers: *Lake Champlain.

Plaintiffs brought action against the State of New York for damages resulting from the flooding of their land. The land in question was situated on either side of Wood Creek, a stream which before 1908 flowed northerly and discharged into Lake Champlain. In 1908, the State, in constructing the Champlain branch of the Barge Canal through the Wood Creek Valley, substantially altered the flow of Wood Creek. Plaintiffs claim that these changes in the flow of the creek and the subsequent maintenance of the canal caused the flooding of their land and the destruction of their crops. The Court of Claims awarded money damages for this flooding and crop destruction. The Court of Appeals affirmed, per curiam. (Dearing-Florida)

COMM'RS OF DRAINAGE DISTRICT NO 5 V ARNOLD (JUDICIAL INTERPRETATION OF DRAINAGE STATUTE).

383 Ill 498, 50 NE2d 825-830 (1943).

Descriptors: *Illinois, *Administrative decisions, *Legislation, *Drainage districts, Boundaries (Property), Judicial decisions, Jurisdiction, Legal aspects, Natural flow doctrine, Proprietary power, State governments, State jurisdiction, Drainage ditches, Drainage systems, Drainage engineering, Administrative agencies, Adjudication procedure.

Defendant connected tile drainage ditches running across his land with an open ditch constructed by plaintiff drainage district. Defendant's land was located outside the district. An Illinois statute stated that any person whose land lay outside a drainage district and, in the opinion of the district commissioners, benefitted from work done in said district, would be deemed to have voluntarily applied to be included in said drainage district and to be subject to all provisions of the statute. The Supreme Court of Illinois held that the statutory language placed jurisdiction of such matters solely in the hands of the commissioners of the districts. Consequently, plaintiff commissioners' decision that defendant benefitted from work done in its drainage district, and thus came within the purview of the statute, was not judicially reviewable. The lower court proceedings were therefore a nullity. (Clarke-Florida)

IOHAWK CARPET MILLS, INC V STATE FLOODING CAUSED BY STATE'S EGLIGENCE IN CANAL CONSTRUCTION).

67 App Div 707, 48 NYS2d 96-99 (1944).

Descriptors: *New York, *Ice jams, *Flood amage, *Channel improvement, Canals, Ice, Ice- vater interfaces, Boulders, Ice loads, Legal aspects, udicial decisions, Riparian land, Riparian rights, iparian waters, Watercourses (Legal), Damages, verflow, Flooding, Floodwater, Water spreading, Vater injury, Dredging, Explosives.

laintiff carpet mill brought action against defen- ant state seeking to recover for damages caused y a flood and ice jam in the Mohawk River and arge canal. Defendant had converted the river nto a barge canal and in so doing had altered the hannel by widening it, thereby creating spoil accu- nulation. An ice jam had backed up to plaintiff's roperty, and, when the river rose following up- tream rain, the ice and flood water came onto the roperty, crushing a wall of the mill and doing ther serious injury. Plaintiff argued that the state hould have taken action, such as dynamiting the am, in order to protect waterfront property. De- endant claimed that such jams had always freed hemselves and that no action had appeared neces- ary to protect the property. The court held that damages are allowable to those suffering injury caused by the use or management of the state's canals, or by the neglect or misconduct of any of- icer of the state having charge thereof. The order of the lower court dismissing plaintiff's claim was reversed, and a new trial was ordered to determine the amount of damages. (Price-Florida)

UNITED STATES V DICKINSON (GOVERNMENT'S LIABILITY FOR EROSION CAUSED BY FLOODING).
331 US 745, 67 S Ct 1382-1386 (1947).

Descriptors: *West Virginia, *Condemnation, *Compensation, *Condemnation value, Overflow, Land reclamation, Judicial decisions, Legal aspects, Dams, Damages, Impounded waters, Impoundments, Navigable waters, Riparian land, Riparian waters, Eminent domain, Flooding, Flood damage, Easements, Evaluation, Erosion control, Bank erosion, Federal government, United States, Erosion.
Identifiers: *Consequential damages.

Separate suits were brought by plaintiff landowners against defendant United States to recover the value of property taken by flooding and erosion caused by defendant's dam. The suits were consolidated for trial. Defendant contended that the actions were barred by the six year statute of limitations, but if the actions were deemed to have been timely brought, that the compensation awarded by the trial court for erosion was improper, as such erosion was merely consequential damage and not compensable. The court held that the taking which was the basis for the suits was not complete six years prior to the institution of said suits, and therefore such actions were not barred. The court stated that when the government takes property by flooding, it takes that property as well as that which inevitably washes away as a result of that flooding. If such erosion is in fact preventable by prudent measures, the cost of that prevention is a proper basis for determining damages. When plaintiffs' lands were taken, an obligation to pay for them then arose, and the fact that plaintiffs were permitted to reclaim portions thereof was irrelevant as to the creation of such obligation. The trial court's judgments for plaintiffs were affirmed. (Price-Florida)

UNITED STATES V WILLIS (LIABILITY FOR FLOOD DAMAGE).

141 F2d 314-317 (4th Cir 1944).

Descriptors: *West Virginia, *Compensation, *Condemnation value, *Condemnation, Eminent domain, Federal government, Judicial decisions, Legal aspects, Riparian land, Value, Property values, Appraisals, Evaluation, Damages, Rivers and Harbors Act, Flooding, Flood control, Dams, Dam construction, Navigable rivers, High water mark, Federal jurisdiction, Erosion control, Flood damage.

Plaintiff brought action to recover for flood damage which resulted from a dam constructed by defendant United States. Plaintiff was awarded damages in the trial court pursuant to the Rivers and Harbors Act of 1930. Defendant contended on appeal that the evaluation by the trial court of the land taken was improper, and that plaintiff was not entitled to an award for the loss of cribbing which was submerged when the new water level was established. The court, in affirming, held that the evidence supported the lower court's decision relating to the value of the property taken, and that the cribbing was plaintiff's property and he should be compensated for the loss thereof. The court stated further that the holding did not conflict in any way with previous decisions which held that consequential damages suffered in the exercise of the federal power to improve navigable streams are not recoverable. (Price-Florida)

UNITED STATES V WAUNA TOLL BRIDGE CO (OBSTRUCTION OF NAVIGABLE RIVERS).
130 F2d 855-857 (9th Cir 1942).

Descriptors: *United States, *Condemnation, *Bridges, *Navigable rivers, Appropriation, Administrative decisions, Community development, Easements, Eminent domain, Federal government, Federal jurisdiction, Judicial decisions, Legal aspects, Proprietary power, Public benefits, Relative rights, Right-of-way, Watercourses (Legal), Damages, Navigable waters, Riparian rights, Compensation.

Defendant was granted the privilege of constructing a private bridge over the Columbia River by an act of Congress. Shortly after its completion, Congress authorized the construction of a federal dam two miles below it. Despite a congressional act requiring, at the expense of the owner, alteration of a bridge which at any time obstructs navigation, Congress authorized reimbursement of all bridge owners on the river for required alterations resulting from the higher level of the impounded waters. In addition to this amount, defendant received from plaintiff United States the proceeds of a condemnation proceeding for a flowage easement allowing plaintiff to back up water over the easement and 2 piers supporting defendant's bridge. Defendant, however, claimed further damages in the form of lost tolls, ferry expenses and increased maintenance expenses. The court held that, pursuant to the above mentioned acts, defendant had an absolute duty to bear all expenses related to removing its obstruction to navigation. The reimbursement and condemnation awards were thus discretionary, and defendant could not be heard to complain of the lesser, incidental expenses. (Clarke-Florida)

PETERSON V UNITED STATES (PUBLIC WORK INCLUDES FLOOD CONTROL AND IMPROVEMENTS TO NAVIATION).
119 F2d 145-148 (6th Cir 1941).

Descriptors: *Federal government, *Projects, *Railroad relocation, *Claim (Contracts), Federal jurisdiction, Public benefit, Flooding, Flood control, Flood protection, Water management (Applied), Watershed management, Multiple-purpose projects, Administration, Economics, Management, Navigation, Project purposes, Project planning, Construction, Legal aspects, Judicial decisions, Legislation, Government supports, Supply contracts, Railroads.
Identifiers: *Public work.

Pursuant to the implementation of a flood control and navigation improvement project by a conservancy district and the federal government, it was necessary to relocate certain railroad tracks in order to prevent their being flooded. Therefore, the federal government entered into a formal contract with defendent contractor for the construction of the new railroad roadbed. In addition, defendant executed a bond with defendant surety pursuant to a federal statute requiring bond by any person who contracted with the United States for the performance of public work. A subcontractor of defendant contractor subsequently defaulted in payments for services and supplies, and, as result, plaintiff United States instituted a suit on the bond. Defendants denied all liability on the bond, claiming the work to be done under the contract was not public work, but benefited a privately owned railroad. The court stated that flood control and improvements to navigation involved public work within the meaning of the federal statute requiring bond because the public at large benefited from such work, even though private advantages could incidently be promoted. Therefore, the court held the bond was a valid and enforceable obligation. (Finman-Florida)
W70-09471

GOODMAN V UNITED STATES (FEDERAL GOVERNMENT'S LIABILITY FOR FLOOD DAMAGE).

113 F2d 914-919 (8th Cir 1940).

Descriptors: *Flood damage, *Flooding, *Dikes, *Obstruction to flow, Damages, Engineering structures, Alluvium, Rivers, Navigable rivers, Naviga-

tion, Judicial decisions, Channels, Federal government, United States, Condemnation, Eminent domain, Alluvial channels, Floods, Barriers, Diversion, Water levels, Compensation.
Identifiers: *Governmental immunity.

Plaintiff brought action against defendant United States to recover for flood damage to his crops and land, contending that defendant, in constructing dikes to improve navigation, had diverted the flow of the river adjacent to his alluvial land in such a manner as to cause the natural level of intermittent flood waters to be raised artificially, thus causing his land to be flooded. Defendant contended that plaintiff could not maintain his action because such action sounded in tort, and the federal government was immune from tort actions. The court held that plaintiff had failed to show that the damages constituted a taking of property within the meaning of the fifth amendment so as to require compensation. Plaintiff had to show that there was permanent, as opposed to temporary, damage in order to be able to maintain a suit against the government. Since there was no such showing, the instant action did sound in tort, and defendant was immune to it. (Snow-Florida)
W70-09473

INLAND POWER AND LIGHT CO V GRIEGER (FLOOD DAMAGE FROM NEGLIGENT DAM OPERATION).

91 F2d 811-819 (9th Cir 1937).

Descriptors: *Washington, *Flood damage, *Dams, *Reservoir operation, Floods, Flooding, Flood control, *Erosion, Reservoirs, Historic flood, Floodgates, Discharge (Water), Impounded waters, Water levels, Rainfall, Precipitation intensity, Excessive precipitation, Supercritical flow, Velocity, Flow rates, Average flow, Judicial decisions, Legal aspects, Flow augmentation.

Plaintiff riparian landowner brought action against defendant power company for damages which resulted from defendant's allegedly negligent operation of its dam, which was located upstream from plaintiff's property. Plaintiff argued that during unusually heavy rain, defendant discharged such amounts of water that its reservoir that valuable soil was eroded from his property and sand and gravel were deposited in its place. Defendant claimed that the damage caused to plaintiff's land was the result of an 'act of God', and that it had acted reasonably in discharging the excess water into the river. The Ninth Circuit Court of Appeals, in affirming the trial court's judgment for plaintiff, ruled that where damage results from defendant's negligence and an 'act of God' as concurring causes, defendant is liable to the same extent as though the damage has been caused by his negligence alone. (Barker-Florida)
W70-09476

UNITED STATES V CHICAGE B AND Q RR (EXTENT OF JUST COMPENSATION IN CONDEMNATION PROCEEDING).
82 F2d 131-141 (8th Cir 1936).

Descriptors: *Condemnation value, *Eminent domain, *Floodways, *Easements, Dams, Flooding, Design flood, Structures, Floods, Judicial decisions, Rivers, Mississippi River, Banks, Navigable rivers, Navigation, River flow, Federal government, Railroads, United States, Flood damage, Compensation, Condemnation, Legal asepcts, Right-of-way, Damages, Backwater.

The United States brought a condemnation suit for a flowage easement over lands flooded by a dam constructed in the interest of navigation. The condemned lands constituted an embankment supporting defendant's railroad tracks. Defendant contended that it was entitled to the value of lands actually flooded plus damages resulting to the remainder of the land as a result of the effects of saturation, wave action and distortion of ice which would harm the tracks and necessitate expensive repairs. Plaintiff admitted that defendant was entitled to the value of the land actually flooded, but contended that no responsibility existed as to the damages to the unflooded land. The court held that the meaning of 'taken', which required compensation under the fifth amendment, had been expanded to mean 'taken or damaged'. Thus where a portion of land is taken, just compensation includes all direct damages which arise out of such appropriation, including damages to the remainder of the property. Consequently, defendant was entitled to the value of the land flooded and to the damages which were a direct result from such flooding. (Snow-Florida)
W70-09482

CITY OF PHILADELPHIA V STANDARD OIL CO (USE OF PUBLIC BULKHEAD BY RIPARIAN OWNER).
79 F2d 764-767 (3rd Cir 1935).

Descriptors: *Bulkheads, *Pennsylvania, *Channel improvement, *Sediment control, Engineering structures, Structures, Walls, Retaining walls, Navigation, Docks, Judicial decisions, Dredging, Legal aspects, Bulkhead line, Rivers, Banks, Riparian rights, Riparian land, Navigable waters, Navigable rivers, Channels, Channel flow, Bank stability, Legislation, Relative rights.

Plaintiff municipality constructed bulkheads along the banks of a navigable river pursuant to legislative authorization. The act provided that riparian owners who made use of the bulkheads for wharf purposes were under a duty to pay to the municipality the cost of the bulkhead to the extent used. Plaintiff brought action against defendant oil company to recover the cost of a portion of the bulkhead, contending that defendant, in dredging a ship basin in front of the bulkhead, had used the bulkhead as an aid in preventing the river's banks from sloughing into the basin so as to be under a duty to pay the city for so using the bulkhead. Defendant contended that the act did not apply where the bulkhead was utilized as an aid to dredging operations. The court held that the act imposed upon riparian owners a duty to pay for the bulkhead only when it was used for wharf purposes, and that the activity of defendant was not of such purpose. Consequently, defendant was under no duty to pay the city for the cost of the bulkhead. (Snow-Florida)
W70-09483

COOPER V CITY OF BOGALUSA (FEDERAL RESPONSIBILITY FOR DAMAGES CAUSED BY NAVIGATION IMPROVEMENTS).
195 La 1097, 198 So 510-513 (1940).

Descriptors: *Louisiana, *Federal government, *Dredging, *Access routes, Navigable waters, Local governments, Legal aspects, Judicial decisions, Damages, Condemnation, Right-of-way, Channel improvement, Canal construction, Navigation, Compensation, Eminent domain, Legislation, Dams, Locks, Cost sharing.

Plaintiff landowner, whose land allegedly was isolated and access to it cut off by action of the United States in dredging a navigable river, sued defendant city for damages. Plaintiff contended that the city was liable since: (1) the United States was acting as agent of the city; (2) the city had provided the land for the government to build dams and locks on; and (3) the city had agreed to assume responsibility for all property damage incident to such construction. The court held that plaintiff had no cause of action against the city. The United States was not acting as agent of the city so as to render the city liable as a principal where the river improvement was for navigation purposes exclusively under the federal commerce powers and where the work was solely under government control. The city's responsibility for damages extended only to those damages which might be assessed against the United States. (Hubener-Florida)
W70-09486

SCOTT V RED RIVER-BAYOU PIERRE LEVEE AND DRAINAGE DIST (RIGHT TO COMPENSATION FOR EXPROPRIATED LAND).
7 So 2d 429-433 (La Ct App 1942).

Descriptors: *Louisiana, *Drainage districts, *Drainage systems, *Eminent domain, Canals, Damages, Compensation, Drains, Local governments, Legal aspects, Judicial decisions, Property value, Bridges, Assessments, Appraisals, Costs, Flood damage, Land tenure, Right-of-way, Construction.

Plaintiff landowner brought action against defendant drainage district for damages caused to her land when the district undertook the widening and deepening of a natural drain located on her property. Plaintiff sought recovery for: (1) land covered by spoil dirt extending 100 feet from the edge of the canal; (2) land damaged by overflowing drainage water; and (3) defendant's failure to construct a bridge over the canal. The court granted recovery only for the land actually used, i.e. that portion covered by the spoil dirt. The court held that plaintiff failed to state a cause of action with respect to the land damaged by overflow because she had not alleged either that the land had been assessed the previous year or the amount of the assessment. The failure to construct the bridge was not compensable since such a structure did not come within the constitutional provision requiring the drainage district to pay for 'property used or destroyed.' (Hubener-Florida)
W70-09487

MEYERING LAND CO V SPENCER (DRAINAGE DISTRICT HAS NO POWER TO CONSTRUCT SEWERS UNDER AUTHORITY FOR DRAIN CONSTRUCTION).
273 Mich 703, 263 NW 777-780 (1935).

Descriptors: *Michigan, *Drainage districts, *Sewers, *Administrative decisions, Drains, Pipes, Pipelines, Concrete pipes, Local governments, Adjudication procedure, Judicial decisions, Legal aspects, Decision making, Drainage programs, Economic impact, Water law, Surface drainage, Drainage systems, Septic tanks, Sewage disposal, Closed conduits, Sewage, Taxes, Assessments, Remedies.

Plaintiff landowners sued defendant drain commissioner to set aside and declare fraudulent certain proceedings laying out and establishing a drainage district, and to enjoin the collection of related tax assessments. Plaintiffs claimed that the drains were not laid out for the drainage of surface water, but as sewage facilities for certain subdivisions. Defendant contended that the proceedings were not subject to judicial review and could only be attacked through certiorari. The evidence established that the 'drains' followed the streets of the subdivisions, included a six-inch Y for every lot and were laid with sealed, watertight joints which prevented any surface drainage and that the natural drainage of the property was more than adequate. Reversing a judgment for defendant, the court held that defendant had no power to construct a sewer system in pursuance of a petition proceeding for a drainage system, and defendant's action was reviewable since it was outside his authority, although certiorari is the only remedy where the claim is that the authority was improperly exercised. (Liptak-Florida)
W70-09488

MAFFEI V BERRIEN COUNTY (COUNTY'S LIABILITY FOR FLOOD DAMAGE CAUSED BY NEGLIGENT MAINTENANCE OF DRAINAGE SYSTEM).
293 Mich 92, 291 NW 234-236 (1940).

Descriptors: *Michigan, *Local governments, *Drainage practices, *Flood damage, Drainage, Surface drainage, Ditches, Drainage effects, Governments, Floods, Damages, Drainage water, Cities, Legal aspects, Judicial decisions, Water law, Excavation, Overflow, Streams, Surface runoff, Dredging, Channel improvement, Outlets.

laintiff farmer brought an action against defendant county for damages caused by flooding. The reek which flowed through plaintiff's farm was the rainage outlet for the natural and artificial drains unning through neighboring land. The county rain commissioner cleaned, deepened, and idened these drains to increase their drainage apacity, but did not perform any work on the outet creek. As a result the creek overflowed, amaged plaintiff's land and crops. Plaintiff conended that this was negligence, and that defendant ad a duty to protect landowners from such amage. Defendant contended that it was not liable or the negligent acts of its officers or agents in the bsence of statutory provision. The court held that, s a general rule, counties and municipalities are ot liable for the actions of their officers and agents ince they are involuntary corporations created by he state and in the state's behalf. The court held hat the duties imposed by law upon the county rain commissioner were not defendant's duties, herefore the negligent acts of the commissioner ere not the acts of defendant. Defendant's motion o dismiss was granted. (Liptak-Florida)
V70-09492

MILLER V MONONA COUNTY (DRAINAGE DISTRICT LIABILITY FOR NUISANCE).
294 NW 308-311 (Iowa 1940).

Descriptors: *Iowa, *Drainage districts, *Drainage, *Floods, Judicial decisions, Legislation, Administration, Drains, Flooding, Flood damage, Legal aspects, Drainage systems, Washouts, Rainfall, Dikes, Diversion, Diversion structures, Levees, Local governments.
Identifiers: *Nuisance.

Defendant was a drainage district whose facilities were claimed by plaintiff landowners to constitute a nuisance by increasing damage caused by floodwaters. The trial court ordered the district to abate the complained of nuisance. The Supreme Court of Iowa reversed, stating that drainage districts are creatures of statute and are incapable of creating nuisances when operating within the ambit of their constitutional authority. Nuisance statutes do not apply to properly operated drainage districts. The trial court in the instant case was without authority to order alteration of the structures of the drainage district on the ground that the structures constituted a nuisance. (Dye-Florida)
W70-09493

HOGUE V WONONA-HARRISON DRAINAGE DIST (PROTECTION OF PRIVATE PROPERTY FROM FLOODING CAUSED BY DRAINAGE IMPROVEMENTS).

296 NW 204-209 (Iowa 1941).

Descriptors: *Iowa, *Drainage districts, *Dikes, *Flooding, Judicial decisions, Legislation, Legal aspects, Missouri River, Taxes, Structures, Flood control, Flood protection, Levees, Surface drainage, Drainage effects, Drainage programs, Surface waters, Drainage, Floods, Floodgates, Drainage systems, Alteration of flow, Obstruction to flow, Surface runoff, Flood damage.

Plaintiff held upland property partly within defendant drainage district. Prior to action by the drainage district, plaintiff's land was sufficiently drained by a creek which emptied into a nearby river. After construction by the district of dikes along the river below plaintiff's property, floodwaters were backed up, damaging plaintiff's property. Plaintiff sought to require the drainage district to construct floodgates or other means of protecting his property from floodwaters. Defendant alleged that it was without statutory power to construct floodgates to protect plaintiff's land, part of which was outside the district. Furthermore, the construction of the dikes was within the proper exercise of powers of the district. The trial court ordered the district to protect plaintiff's land either by raising the level of dikes bordering the creek to the level of the dikes along the river or by providing floodgates. The Supreme Court of Iowa affirmed. Floodgates are part of a drainage system, and a drainage district is empowered to build them. A drainage district is empowered and obligated to protect lands flooded as a result of its activities. (Dye-Florida)

TOWN OF WAUSAUKEE V LAUERMAN (LIABILITY FOR FLOOD DAMAGES).
240 Wis 320, 3 NW2d 362-366 (1942).

Descriptors: *Wisconsin, *Dams, *Flood damage, Judicial decisions, Legal aspects, Legislation, Flooding, Floods, Bridges, Washouts, Recreation, Reservoirs, Damages, Risks, Rainfall, Rain, Governments, Local governments, Highways, Storms, Dam failure, Remedies, Excessive precipitation, Rivers.

Defendant landowner constructed a dam on a river which flowed through his property for the creation of a recreational pond. The dam broke following a heavy rainfall and damaged plaintiff town's property downstream. Plaintiff charged: (1) that defendant was liable under a statute imposing strict liability for damages caused by interference with the natural course of a stream; or (2) that defendant was negligent in maintaining the dam. Defendant denied that strict liability applied and contended that the rainfall was too heavy to foresee. The Supreme Court of Wisconsin held that the statute relied upon by plaintiff imposes strict liability for damages caused by the mere existence of a properly operated dam. Other damages are to be judged on the basis of negligence. Defendant was negligent only if the volume of rain and the consequent damage was foreseeable. The jury found the rainfall to be unusual for the area and not foreseeable by a reasonable and prudent man. Since foreseeability is a fact question, the jury's finding for defendant was upheld. ROCKFORD PAPER MILLS, INC V CITY OF ROCKFORD (FLOOD DAMAGE TO DAM AND OTHER PROPERTY FROM NEGLIGENT DAM OPERATION).
311 Mich 100, 18 NW2d 379-382 (1945).

Descriptors: *Michigan, *Dams, *Cities, *Impounded waters, Flow control, Rain, Ice, Judicial decisions, Legal aspects, Damages, Municipal water, Flood damage, Islands, Floodgates, Flooding, Dam failure, Excessive precipitation, Riparian rights, Diversion, Rivers, Public utilities, Water works, Water supply, Flow augmentation.

Plaintiff paper company owned a mill, land and a dam downstream from defendant city's dam. As a result of the melting of a heavy winter snowfall and an unusually heavy rainfall, the flow of the river upon which the dams were situated was significantly increased. The increased flow necessitated defendant's opening of its floodgates to maintain a normal water level behind its dam. As a result of the increased river flow, plaintiff's dam was damaged. Plaintiff brought action to recover these damages which it alleged resulted from defendant's negligent operation of its dam. The court held that defendant had a right to discharge water from its pond faster than it flowed in so as to reduce the elevation of the pond and facilitate its business. To hold defendant responsible there must have been a finding of negligence or an intention to release impounded waters to damage plaintiff's dam. No such finding had been made, and defendant could not be held responsible for a superfluity of waters coming from a flood condition arising above its dam. (Barnett-Florida)

4C. Effects on Water of Man's Non-Water Activities

WATER AS AN URBAN RESOURCE AND NUISANCE,
Geological Survey, Washington, D.C.
Harold E. Thomas, and William J. Schneider.
Available free on application to the US Geological Survey, Wash, DC, 20242. US Geological Survey Circular 601-D, p D1-D9, 1970. 9 p, 15 ref.

Descriptors: *Water resources, *Floods, *Urbanization, Water supply, Flood control, Rainfall-runoff relationships, Social aspects, Cities, Legal aspects, Water rights, Water law, Water resources development.
Identifiers: Urban hydrology.

Many urban activities are concerned with development and use of the land and its resources other than water; these activities affect the natural water flow system and are affected by it. The development and use of water may create nuisances if they adversely affect the use of the land and solid-earth resources and invade recognized property rights. Conversely, the development and use of the land resources may have effects on water that interfere with the rights of others and thus cause nuisances. In urbanized areas, water as a resource becomes increasingly inadequate to meet the requirements of the concentrated population and industry; it must be imported from other areas. Buildings and pavements inhibit groundwater recharge and promote rapid runoff from storms. Increased flood peaks cause erosion and sediment transport, as do various construction activities. Vulnerability to floods is increased by urban encroachment upon floodplains. In these and many other ways water causes inconvenience or annoyance to urban life and damage to property and thus constitutes a nuisance. The urban water problem can be solved, but only if a complete understanding of the role of water in the urban environment--and indeed in the overall water picture--is realized. Such understanding can be achieved through the proper interpretation of adequate date. (Knapp-USGS)

MORPHOLOGY OF GULLIES IN THE COLORADO ROCKY MOUNTAINS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
Burchard H. Heede.
French resume. Bulletin International Association of Scientific Hydrology, Vol 15, No 2, p 79-89, June 1970. 11 p, 2 fig, 3 tab, 9 ref.

Descriptors: *Gullies, *Gully erosion, *Geomorphology, Erosion control, Colorado , Rocky Mountain Region, Sediment yield, Vegetation effects, Drainage patterns (Geologic).
Identifiers: Stream orders.

A classification of gullies into discontinuous and continuous channels not only expresses differences in channel morphology and stage of development, but also presents helpful criteria for design of gully control. The term 'critical location' was introduced for those locations within gullies that are obviously susceptible to changes, and whose direction of change is suggested. Regression analyses underlined the fact that the gullies constituted channels of youthful stage if relations between components in channel geometry were considered. (Knapp-USGS)

PAYNE V MISSOURI VALLEY DRAINAGE DIST NO 1 (CONSTRUCTION OF NEW SETTLING BASIN AS REPAIR OF OLD BASIN).

272 NW 618-624 (Iowa 1937).

Descriptors: *Iowa, *Drainage districts, *Repairing, *Settling basins, Ditches, Drainage, Drainage effects, Drainage practice, Flood routing, Tile drainage, Sediments, Silts, Channel improvement, Drainage systems, Sediment control, Administrative decisions, Judicial decisions, Water law, Legal aspects, Right-of-way, Condemnation, Administration, Relocation, Assessments.

Plaintiff landowner brought action to enjoin defendant drainage district's construction of a new settling basin which would divert water from the old basin through a drainage ditch on plaintiff's land. Plaintiff alleged that silt and sediment from the old basin would fill up the ditch, rendering his tiled drainage system worthless. Plaintiff further contended that this new drainage plan required statutory notice and reclassification of the land. Defendant contended that, since the old basin was completely filled with silt and sediment, it was merely making repairs, for which no notice or reclassification was required. Affirming the dismissal of plaintiff's petition, the court held that the construction was obviously repair work since it was done solely to keep the drainage system functioning, the old basin being filled with silt and sediment. Therefore, no notice or reclassification was required. (Liptak-Florida)

RESERVOIR EFFECT ON DOWNSTREAM WATER TEMPERATURES IN THE UPPER DELAWARE RIVER BASIN,
Delaware River Basin Commission, Trenton, N.J.
Owen G. Williams.
US Geological Survey Prof. Paper 600-B, p B195-B199. 5 fig, 1 tab, 1 ref.

Descriptors: *Water temperature, *Delaware River, *Reservoirs, Hydrographs, Mass-curves, Climatic data, Mathematical models, Watersheds (Basins), River flow, Air temperature, Hypolimnion.
Identifiers: Thermographs.

Seasonal water-temperature data were obtained at five sites in the upper reaches of the Delaware River. The data were graphically analyzed by plotting and double-mass curves. Hydrographs, temperature records, and double-mass curves can be used to determine and substantiate both climatological and release effects on downstream water temperatures. Comparison of water-temperature records not affected by the reservoir releases with those collected on a stream which is affected, combined with a knowledge of local climatological conditions, can be used to estimate the effect of these releases on stream temperatures. Releases from New York City's Cannonsville Reservoir have caused a drop in water temperature of 26F, 8.1 miles downstream, and of 8F, 44.3 miles downstream. Releases from New York City's Pepactor Reservoir have caused a drop of 20F, 31 miles downstream, and 5F, 59.4 miles downstream. (Osborne-Vanderbilt).

J. A. Leenheer.
Purdue University, Doctor of Philosophy Thesis, August, 1970. p 110, 28 fig, 3 tab, 71 ref. OWRR Project A-005-IND (14).

Descriptors: *Pesticide kinetics, Pesticide adsorption, Carbamate pesticides, *Organic pesticides, Organic matter, Isotherms, *Soil organic matter, Surface adsorption.
Identifiers: Romney silty clay loam, Zanesville silty clay loam, Carlisle muck, Parathion pesticide.

Pesticides are a potential water pollutant. Soil organic matter surfaces adsorbs certain kinds of compounds and render them essentially immobile. The mechanism of pesticide adsorption on soil organic matter is reported in this study. The adsorptive capacities of Carbaryl and parathion upon various organic matter adsorbents were compared by determining adsorption isotherms for aqueous insecticide concentrations ranging up to 6 ppm. For all adsorbents, the adsorptive capacities of parathion were two to three times the adsorptive capacities of carbaryl. Romney soil organic matter with hydrogen on the exchange sites was found to adsorb much more carbaryl and parathion than with calcium on the exchange sites. Water vapor adsorption isotherms showed the hydrogen saturated organic matter to have a much more hydrophobic nature than the calcium saturated organic matter. A similar direct relationship between the hydrophobic nature of the adsorbent surface and the extent of adsorption was found for a carbaryl cation exchange resin with calcium and hydrogen saturation. A non-ionic hydrophobic resin gave very large adsorptive capacities. Differences in the adsorptive capacities between the organic matter adsorbents derived from different soils were relatively slight.

ntifiers: BOD mass balance, Water quality standards.

establish appropriate water quality controls, the gnitude of the gross pollution load of a basin uld be known. Usually it is not. Mathematical deling of basinwide BOD relationships can be tly facilitated by applying known equations on asis of BOD mass loading rather than of BOD centration. The necessary hydrologic basis indes travel time dye tests, data as to slopes and ances, and computation of travel times for all s of the basin at various stages. Treatment plant instream BOD records are essential. The basic D removal parameter must be computed and sted for different conditions. The remaining putations require a computer but are not espely difficult. The principal reservation as to accuy of the results consists of the allowance that t be made for nitrogenous BOD. Applications his method to three New Jersey basins indicate in each case the recorded BOD data from tment plants account for less than half of the l pollution loading entering the stream. The cy implication is that it is inappropriate to plan er quality standards and programs of corrective asures on the assumption that recorded effluents stitute the only major source of pollution. entifiers: Body weight, Dojo fish, Goldfish.

If the variance of size of test organisms used in the biological assay experiment of chemicals is large, the dosage applied must be corrected corresponding to their size. 'Size factor' for equalizing individual differences in body weight can be calculated by the multiple regression equation. The survival time after immersion was determined as the function of dosage and body weight. Based on this idea, a comparative test on susceptibility to E1-43,064 between the goldfish and 'Dojo' fish was made by the dipping method. The result has shown that the 'Dojo' fish is 5.32 times as susceptible as the goldfish to E1-43,064. (Sjolseth-Washington)

Translated from Hydrochemical Materials (Gidrohkimicheskiye Materialy), Vol 49, p 166-174, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 171-177, 1969. 7 p, 8 fig, 10 ref.

Descriptors: *Biodegradation, *Waste assimilative capacity, *Stream flow, *Self-purification, Laboratory tests, Oxidation, Nitrification, Ammonia, Water pollution effects, Path of pollutants, Nutrients, Organic matter.
Identifiers: *Carbohydrate biodegradation, USSR.

A study was made to determine the self-purification in natural waters of pollution by various classes of hydrocarbons (monosaccharides and polysaccharides): glucose, sorbose and maltose, which may be present in the waste water of the food industry. Decomposition of glucose, sorbose, and maltose depends insignificantly on the initial concentration of the substance and practically terminates on the 4th day. Oxidation of hydrocarbons in natural water under laboratory conditions occurs mainly as a result of biochemical oxidation and is accompanied by a considerable increase in the number of saprophytic microflora (to 100,000/ml) and a decrease in the concentration of oxygen dissolved in the water. Ammonification slows down during the self-purification of water from hydrocarbons. A slight slowing down of nitrification is observed only at a hydrocarbon concentration exceeding 25 mg/liter. (Knapp-USGS)

OXIDATION OF ALCOHOLS AND THEIR INFLUENCE ON THE SELF-PURIFICATION OF NATURAL WATERS,
Nauchno Issledovatelskii Gidrokhimicheskii Institut, Novocherkassk (USSR); and All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
L. P. Sokolova, and V. T. Kaplin.
Translated from Hydrochemical Materials (Gidrokhimicheskiye Materialy), Vol 49, p 175-182, 1969. Soviet Hydrology: Selected Papers, Issue No 2, p 177-183, 1969. 7 p, 5 fig, 1 tab, 15 ref.

Descriptors: *Biodegradation, *Alcohols, *Waste assimilative capacity, *Self-purification, *Stream flow, Laboratory tests, Oxidation, Nitrification, Ammonia, Water pollution effects, Path of pollutants, Nutrients, Organic matter.
Identifiers: *Alcohol biodegradation, USSR.

The kinetics and mechanism of decomposition of individual aliphatic alcohols and aldehydes in natural bodies of water and their effect on natural self-purification were studied for methyl and ehtyl alcohols and formaldehyde. Study of the decomposition rate of alcohols in natural water with allowance for the dynamics of saprophytic microflora showed that during intense alcohol decomposition the number of colonies increased sharply. Propanol and pentanol show a tendency to slow down the development of the saprophytic microflora to the extent that the number of colonies even decreased in the first day of the experiment. This decrease was followed by increased multiplication of the bacteria. The biochemical oxidation of alcohols is the main and decisive process leading to the decrease in the concentration of alcohols in natural bodies of water. The oxidation of alcohols results in a sharp decrease of the oxygen dissolved in water and this may have a harmful effect on the oxygen regime. The alcohols tested have a significant effect on nitrification and ammonification processes. The content of ammonium ions increases and nitrification is slowed down considerably in the presence of alcohol. (Knapp-USGS)

RESEARCH NEEDS ON THERMAL AND SEDIMENTARY POLLUTION IN TIDAL WATERS.
American Society of Civil Engineers. Committee on Tidal Hydraulics of the Hydraulics Div.

Journal of the Hydraulics Division, Proceedings of ASCE, Vol. 96, No. HY7, Proc. Paper 7426, July 1970, p1539-1548, 7 ref.

Descriptors: *Thermal pollution, *Sediment discharge, *Tidal waters, Stratification, Estuarine, Environment, Research and development, Sediment transport, Water quality, Hydraulics, Physics, Dispersion, Heat transfer.
Identifiers: *Sedimentary pollution, Hydraulic environment.

When recently requested to identify the most pressing research need in its field, the ASCE Tidal Hydraulics Committee quickly arrived at the concensus opinion that thermal and sedimentary pollution of tidal water bodies was the major problem in need of research in its respective field. The report describes the nature of this problem and includes a review of the literature and some related research. The report outlines general and specific research needs in both thermal and sedimentary pollution and includes a section on instrumentation. It recommended detailed studies as follows: 1. An assessment of sedimentary and thermal pollution problems in selected estuaries of various characteristics. 2. A comprehensive assessment of the state-of-the-art understanding of thermal and sedimentary pollution in tidal waters. (Hsieh-Vanderbilt)

HEAT WASTE,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
Bob Stearns.
Sea Frontiers, Vol. 16, No. 3, May-June, 1970, p154-163, 6 fig.

Descriptors: *Heated water, *Nuclear powerplants, *Cooling water, *Tropical regions, *Estuarine environment, Heat flow, Vegetation, Isotherm, Human population, Coasts, Distribution patterns, Cooling towers, Canals.
Identifiers: *Population control, Capital tax.

Florida Power and Light Company is constructing a combination conventional (in operation) and nuclear (under construction) electric powerplant at Turkey Point on the southwestern shoreline of Biscayne Bay. This area is of special interest since it is the first nuclear power plant under construction in a tropical or near tropical area. It was observed that temperature at the effluent canal exists averaging 9 deg to 11 deg F above bay ambient and the thermal plume position is persistent. Significant damage of bottom vegetations was observed. Many cooling methods were discussed. Due to the huge size of plant, hurricane force winds and drift problem, no satisfactory cooling method can be achieved. The author suggested that whole population control or population density control should be done before we can solve the problem of increasing power demands. (Hsieh-Vanderbilt)

BUOYANT PLUMES AND THERMALS,
Cambridge Univ. (England). Dept. of Applied Mathematics and Theoretical Physics.
J. S. Turner.
Annual Review of Fluid Mechanics, Vol. 1, p 29-44, 1969, 3 fig, 53 ref.

Descriptors: *Turbulence, *Buoyancy, *Geothermal studies, Convection, Density, Reynolds number, Profiles, Velocity, Clouds, Air circulation, Condensation.
Identifiers: *Plume, Entrainment, Similarity argument.

This chapter summarizes the literature covering a variety of phenomena that can be related under the general heading of turbulent buoyant convection from small sources. The studies are generally based on laboratory experiments and therefore the assumption is made that the form of the buoyancy source and the environmental conditions can be specified in advance and that these remain unchanged during the whole time the plume or thermal is being studied. The plumes and thermals are first considered in a uniform environment. For both plumes and thermals, the proportional rate of entrainment depends inversely on the radius. However, the rate of dilution of thermals is much greater than for plumes. It should be noted that no way has been found so far to deal numerically with the sharp boundary between the turbulent buoyant fluid and its surroundings. In an unstable environment, similarity arguments can also be used to exhibit some important features of convection from small sources. Yet, in a stable environment, initial conditions and density distributions are needed for the similarity argument. (Osborne-Vanderbilt)

NOTES ON A THEORY OF THE THERMOCLINE,
Scripps Institution of Oceanography, La Jolla, Calif.
Walter H. Munk, and Ernest R. Anderson.
Journal of Marine Research, Vol 7, No 3, p 276-295, November 1948. 7 fig, 4 tab, 8 ref.

Descriptors: *Thermocline, *Currents (Water), *Heat flow, *Water temperature, Solar radiation, Convection, Winds, Shear stress, Latitudinal studies, Turbidity, Salinity, Bathythermographs, Stability
Identifiers: *Eddy viscosity, Eddy conductivity.

In this report, the function for eddy viscosity introduced by Rossby and Montgomery and a newly derived function for eddy conductivity are substituted into the differential equations governing the distributions of temperature and current. The equations are then solved simultaneously. In view of the difficulty experienced in selecting conditions under which heat loss by evaporation is relatively small compared to heat gain by radiation, it would appear that convective stirring is as important as wind stirring in many, and perhaps most, cases. The results of the report indicate: (1) that the sharp transition between the mixed layer and the thermocline can be accounted for theoretically by letting the eddy coefficients be functions of the stability and shear; (2) that the theory gives a thermocline depth which, although too shallow, is of the right order of magnitude; (3) that this depth depends on wind speed, latitude, heat flux, and the temperature salinity correlation, in the order stated; and (4) that the variation with each of these factors occurs in a reasonable direction. (Osborne-Vanderbilt)

COMPOSITION OF WATER IN CLINCH RIVER, TENNESSEE RIVER, AND WHITEOAK CREEK AS RELATED TO DISPOSAL OF LOW LEVEL RADIOACTIVE LIQUID WASTES,
Geological Survey, Washington, D.C.
R. J. Pickering.
For sale by Superintendent of Documents, U S Government Printing Office, Wash, D C - 20402. Price $0.30. U S Geological Survey Professional Paper 433-J, p J 1 - J 15, 1970. 15 p, 4 fig, 6 tab, 39 ref.

Descriptors: *Radioactive waste disposal, *Water pollution sources, *Water pollution effects, *Path of pollutants, Streamflow, Sediments, Adsorption, Absorption, Chemical precipitation, Clay minerals, Calcium carbonate.
Identifiers: *Oak Ridge National Laboratory, Tennessee River, Clinch River, Whiteoak Creek.

Radioactive wastes from the Oak Ridge National Laboratory are released to Whiteoak Creek. Samples of water were taken at seven sampling stations during a period of 3 years and composited into weekly or monthly samples according to streamflow. Determinations were made of physical parameters and of the content of stable chemical constituents, radiochemical constituents, and suspended sediment in the composite samples. The water is of the calcium bicarbonate types. Tennessee River water is similar in composition to Clinch River water and the water of Whiteoak Creek, but contains somewhat less bicarbonate, calcium, magnesium, and suspended and dissolved solids, and somewhat more sodium and chloride. Whiteoak Creek is more highly mineralized than the other two streams, and has more sulfate, nitrate, phosphorus, and sodium. Most of the cesium-137 entering the Clinch River in Whiteoak Creek water was associated with suspended solids. In the Tennessee River, cesium-137 was either dissolved in the water or associated with solids of colloidal or near-colloidal size. Much of the strontium-90 present in Whiteoak Creek water may be associated with precipitated calcium carbonate. Close similarities in variations in concentration between ruthenium-106 and cobalt-60 in both Whiteoak Creek and the Clinch River, and their correlation with nitrate reflect their common origin in high-nitrate solutions released to the basin of Whiteoak Creek. Descriptors: *Water quality, *Water supply, *Watersheds (Basins), *Pacific Northwest U.S., *Watershed management, Surface waters, Coliforms, Bioindicators, Water management (Applied), Water policy, Multiple purpose.
Identifiers: *Watershed use.

A study was conducted from December 1966 through September 1967 to measure the physical, chemical, and microbiological quality of water flowing from three watersheds in the northwestern part of the United States. These watersheds were those of the Cedar and Green Rivers in Washington, and the Clackamas River in Oregon. The watersheds are similar in environmental factors such as terrain, elevation, forest cover, and meteorological conditions but vary in their human use. The Cedar watershed is well protected; the Green watershed has some resident population and limited recreational use; and the Clackamas watershed is open for unrestricted access and unlimited recreation. By present techniques, no measurable influence could be determined on bacterial indicator population densities because of the increase in human use level among the Cedar River, the Green River, and the Clackamas River watersheds. The animal population on all three watersheds was much higher than the human use level and generally similar among watersheds. (Knapp-USGS)

A SYSTEM APPROACH FOR THE STUDY AND CONTROL OF FACTORS AFFECTING WATER POLLUTION,
Mississippi State Univ., State College. Water Resources Research Inst.
Abdel-Razek Abouel-Nour.
Available from NTIS as PB-193 720, $3.00 in paper copy, $0.65 in microfiche. Completion Report, Water Resources Research Institute, July

70. 48 p, 1 tab, 15 fig, 8 ref. OWRR Project A-9-MISS (1).

scriptors: Water pollution control, Regression alysis, *Systems analysis, Mississippi, Decomposs organic wastes, Biochemical oxygen demand, ssolved oxygen, *Water quality, Degradation ecomposition), *Numerical analysis, *Water llution sources, Computer programs.
ntifiers: *Pear River (Miss).

e objectives of the research were directed ward testing the feasibility of applying a system proach for the study of pollutants and/or quality tors in a river. The Pearl River and its major outaries were selected to implement the study. ality data of the research areas were supplied by r and Water Pollution Control Commission, ckson, Mississippi. Preliminary analysis of the arl River data suggested treating it by dividing it o reaches. For example, the regression equations the biochemical oxygen demand (BOD), and solved oxygen (DO) for two consecutive reaches ne of them is heavily polluted) underestimate the imate degradation in qualities near the signifi-nt organic waste source. Seven reaches have en used for the Pearl River and its major tributa-s. Stepwise multiple regression FORTRAN pro-am has been compiled and run under an IBM 360 stem for regressing the quality factors of each ach. The quality characteristics of the surface aters have been mathematically explained. Five ts of regression equations, each describing the alities of water in one reach during short and dry riods, were obtained. Another two sets of regres-on equations describing the qualities of water in e river at the city of Bogalusa, Louisiana, one set r the year 1967 and the other for the year 1968, ere also obtained. Within limitations imposed by e data, the regression equations can be used for rposes of prediction. Application of the regres-on equations to include two consecutive reaches iled in statistical tests.

HE EFFECT OF SALINITY ON THE OXIDA-ION OF HYDROCARBONS IN ESTUARINE NVIRONMENTS,
lississippi State Univ., State College. Water esources Research Inst.
. R. Brown, W. E. Phillips, Jr., and J. M. ennyson.
vailable from NTIS as PB-193 706, $3.00 in aper copy, $0.65 in microfiche. Completion Re-ort, Water Resources Research Institute, July, 970. 28 p, 2 tab, 10 fig, 5 ref, append. OWRR Pro-ect A-034-MISS (1).

escriptors: Microbiology, Oil, *Oily water, *Ox-lation, *Hydrocarbons, *Salinity, Estuarine en-ironment, *Degradation (Decomposition), Water ollution sources.
dentifiers: Petroleum degradation.

he physical changes observable during the nicrobial degradation of refined motor oil under onditions of varying salinity indicated a more apid degradation in samples inoculated with bot-om deposits than did those containing just the verlying seawater. These changes were compara-le to those observed in previously conducted fresh vater studies. The rate of oxygen consumption dur-ng the microbial degradation of naphthenic crude il and refined motor oil at various salinities in-licated that more rapid degradation occurred in amples with salinities ranging from 17-34 parts per 000. In all probability these results could be at-ributed to the fact that the inocula were derived rom bottom samples with overlying waters having alinities in these ranges, confirming previous stu-dies which indicated that the origin of the inoculum had a significant effect on the rate of decomposi-tion. It was concluded that while each individual petroleum product will be degraded at a different rate, rates at different salinities will be comparable if the inocula employed in the studies are derived from that salinity. Predominant types of bacteria occurring at different salinities have been isolated and changes in the bacterial population which oc-curred during microbial degradation have been noted and representative species isolated and identified. The naphthenic crude oil appeared to be a more selective substrate since only one genus (P-seudomonas) predominated at the end of incuba-tion, whereas three (3) or more microbial types were evident at the termination of the experiment employing refined motor oil. A number of in-vestigators have asked the question as to whether or not the anaerobic decomposition of hydrocar-bons does occur. While the results reported in this investigation do not answer the question, it can be said that under the conditions employed anaerobic decomposition of hydrocarbons appears to have taken place. The presence of water-isoluble, petroleum ether-insoluble materials in the 'oil layer' was shown as well as the production of ap-preciable amounts of hydrogen sulfide.

A STUDY OF FARM WASTE, FARM ANIMAL WASTE: CHARACTERIZATION, HANDLING, UTILIZATION,
Wisconsin Univ., Madison.
S. A. Witzel, O. J. Attoe, E. McCoy, L. B. Polkowski, and K. Crabtree.
Available from NTIS as PB-193 708, $3.00 in paper copy, $0.65 in microfiche. Supplementary Report, (1970). 141 p, 6 ref, 4 append. OWRR Project B-004-WISC (11).

Descriptors: *Animal wastes, *Waste storage, *Aerobic treatment, *Anaerobic digestion, Surface runoff, Fertilizer, Sewage bacteria, Percolation, Lagooning, Wisconsin.
Identifiers: *Bovine waste, *Groundwater pollution, Fertilizer effectiveness.

The farm animal waste problem in Wisconsin is multifaceted. Not only are there the usual aspects like kinds of animal manures, differences in farming practices (including size of herds, feeds and manner of feeding) but also there are problems because of the geographic location of the state. Its long cold winters enforce at least a consideration of 4-6 months of storage to avoid spreading of manure on frozen ground. Secondly, its glaciated soils present locally different bedrock and soil permeability. In the southern half of the state where both farming and population are concentrated, the waters are hard and fractured limestone formations underlie much of the area. Attention is now being called to the possible pollution of groundwater. And lastly, Wisconsin is a state of lakes and streams, many of which are undergoing critical eutrophication. Farm manure and fertilizer are being blamed at least in part, and thus surface water run-off, enriched by manure spread on hilly land, is a special problem. (See also W70-09425).

GIBSON V CITY OF TAMPA (POLLUTION OF OYSTER BEDS BY UNTREATED MUNICIPAL SEWAGE).

185 So 319-321 (Fla 1938).

Descriptors: *Florida, *Sewage effluents, *Water pollution effects, *Oysters, Leases, Water rights, Pollutants, Municipal wastes, Waste treatment, Sewage disposal, Cities, Bays, Oceans, Water pollution, Sewage, Public health, Water law, Public rights, Local governments, Legislation, Legal aspects, Judicial decisions, Eminent domain, Condemnation, Relative rights.
Identifiers: *Oyster contamination.

Plaintiffs held leases from the state authorizing them to cultivate oysters in Hillsborough Bay, and had built up a valuable oyster business. Plaintiffs brought action against defendant city for damages resulting from the city's practice of dumping raw, untreated sewage into the bay thereby contaminating plaintiffs' oysters, the sale of which was prohibited by defendant city's public health officials. Plaintiffs contended that state law protected their investment in the oyster bed leases. Defendant relied upon the common law right of a municipality to empty its sewage into the sea. The court held that state statutes providing for the propagation and cultivation of oysters, and important industry in Florida, materially altered defendant's common law sewage disposal rights. The court also found that plaintiffs' oyster leases were valuable property rights and could not be taken or damaged without compensation, and remanded the case for a determination of damages. AGRICULTURAL WASTES AND THE ENVIRONMENT,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
E. Paul Taiganides.
Agricultural Engineering, Vol 51, No 6, p 358-359, June 1970.

Descriptors: *Farm wastes, Water pollution sources, Effects, Irrigation effects, Insecticides, Nitrates.

Agricultural wastes contribute fifty percent of the sediment load in rivers in the United States. Animal wastes, crop residues, in addition to insecticides, fertilizers, waste waters from agrochemical processing plants make up these polluting agricultural wastes. The author contends that 'recycling these wastes into the production system' is the only effective way to manage these wastes. (Holmes-Rutgers)

WATER QUALITY IN RELATION TO PRODUCTIVITY OF LAKE ASHTABULA RESERVOIR IN SOUTHEASTERN NORTH DAKOTA,
North Dakota Water Resources Research Inst., Fargo.
John J. Peterka.
Available from NTIS as PB-193 683, $3.00 in paper copy, $0.65 in microfiche. Research Project Technical Completion Report, WI-221-002-69, March 1969. 23 p, 4 tab, 7 fig, 18 ref. OWRR Project A-004-NDAK (1).

Descriptors: Reservoir, *Primary productivity, *Eutrophication, Water quality, *Nutrients, Limnology, Water temperature, *Algae blooms, Cyanophyta, North Dakota.
Identifiers: Lake Ashtabula.

This study attempts to relate the chemical and physical characteristics of the lake water to standing crops and production rates of phytoplankton. The average gross photosynthesis rate was 41 percent of the optimal rate. PHYTOPLANKTON STANDING CROPS AVERAGED <$ UG CHLOROPHYLL/LITER IN THE EUPHOTIC ZONE. Optimal photosynthesis per unit chlorophyll averaged 13.5 mg 02/mg chlorophyll/hour. Gross production per unit chlorophyll decreased with increase in phytoplankton standing crop. Annual gross photosynthesis was 1.4 gC/m2/day. Three empirical equations were used to predict photosynthesis in the euphotic zone. Gross photosynthesis was related to standing crop and water temperature, but not to CO2 or macro-nutrients. High nutrient levels and continual circulation of the water during ice-free periods made the lake eutrophic. (Peterka-North Dakota State)

THE TEMPERATURE SELECTION OF SMALL HYPOPHYSECTOMIZED GOLDFISH, (Carassius auratus L.),
Queen's Univ., Kingston (Ontario). Dept. of Biology.
A. W. Roy, and P. H. Johansen.
Canadian Journal of Zoology, Vol 48, No 2, March 1970, p 323-326, 1 fig, 1 tab, 15 ref.

Descriptors: *Water temperature, *Physiological ecology, *Fish, *Fish physiology, Bioassay, Temperature control.
Identifiers: *Temperature selection, *Horizontal temperature gradient, Goldfish, Pituitary hormones, Hypophysectomy, Nervous system.

The selected temperature ranges of unoperated, sham-operated, and hypophysectomized goldfish were determined in the horizontal temperature gradient. Hypophysectomy did not alter the selected temperature of small goldfish. Three hypotheses can be offered to explain the results. The simplest is that the pituitary is not essential for the maintenance of the temperature selection response by goldfish. The second hypothesis is that neurohypophysis may be involved, since there is evidence that, in at least some hypophysectomized goldfish, a seemingly homologous structure is the hypophyseal area has been found by Sathyanesan and Gorbman. The third is that a balance of pituitary hormones influences the nervous system so that the response is changed with the season as well as acclimatization temperature, and that once the change has been effected, the hormones play no further role and hence their absence has no influence. The last hypothesis could be tested by further work. (Hsieh-Vanderbilt)

TEMPERATURE-DEPENDENT CHARACTERISTICS OF PERIPHERAL NERVES EXPOSED TO DIFFERENT THERMAL CONDITIONS IN THE SAME ANIMAL,
Institute of Arctic Biology, Alaska University, College, Alaska.
L. Keith Miller.
Canadian Journal of Zoology, Vol. 48, No. 1, Jan. 1970, p75-81, 5 fig, 3 tab, 10 ref.

Descriptors: *Cold resistance, *Beavers, *Temperature, Conduction.
Identifiers: *Nerves, *Peripheral nerves, Caudal nerves, Phrenic nerves, Tibial nerves, Excitability, Refractory period, Action potential characteristics, Vitro.

Beaver (Castor canadensis) caudal nerves, accustomed to tissue temperatures approaching 0 deg C, were compared with nerves that encounter less severe cooling (Tibial), and nerves that are accustomed only to deep body temperature (phrenic). Caudal nerves invariably conducted action potentials until freezing at about -5 deg C. Tibial nerves ceased conducting at 0 deg C and phrenic nerves failed at 4.5 deg C. Conduction velocity-temperature slopes of the three nerves were different and absolute refractory periods in the cold-adapted nerves were significantly shorter at low temperature. Results furnish additional proof of cold adaptation in peripheral nerve. (Hsieh-Vanderbilt)

EFFECTS OF THERMAL DISCHARGE FROM THE SAN ONOFRE NUCLEAR GENERATING STATION,
Southern California Edison Co., Los Angeles. Dept. of Mechanical Engineering.
J. N. Reeves.
Proceedings of the Industrial Waste Conference, 23d, Typescript 19 p.

Descriptors: *Thermal pollution, *Nuclear powerplants, *Cooling water, *Oceanography, *Marine fisheries, *Marine plants, *Monitoring, *On-site investigation, Aquatic environment, Outlets, Seashores, Water quality, Temperature, Isotherms, Dissolved oxygen, Bottom sediments, Turbulence, Hydrogen ion concentration.
Identifiers: Kelp, Distribution of kelp beds, Marine biology.

The purpose of this oceanographic monitoring program are to quantitatively and qualitatively describe features of the ocean environment prior to San Onofre plant operation and to evaluate effects which the plant might have on the marine biological community after plant operation begins. The study includes biological observations at five stations along the beach, monitoring the benthic biology at six diving stations offshore and various water quality parameters such as pH, temperature, dissolved oxygen, turbidity, and bottom sediments at 32 hydrographic stations. This report concludes that no significant adverse effects on the general marine environment have been observed which can be associated with the operation of the San Onofre Station which uses 350,000 GPM cooling water. The author believes that this study has demonstrated that the San Onofre plant is compatible with its environment and that the beneficial uses of the marine adjacent to the plant site are being fully protected. (Hsieh-Vanderbilt)
W70-09165

EFFECT OF TEMPERATURE AND SALINITY ON THE HEAT TOLERANCE IN THE HERMIT CRAB, DIOGENES BICRISTIMANUS,
Marathwada Univ., Aurangabad (India). Dept. of Zoology.
R. Nagabhushanam, and R. Sarojini.
Hydrobiologia, Vol. 34, Fasc. 2, Nov. 1969, p 126-134, 10 fig, 12 ref.

Descriptors: *Temperature, *Salinity, *Bioassay, *Heat resistance, Crabs, Invertebrates, Acclimatization, Lethal limits, Tidal effect.
Identifiers: *Diogenes bicristimanus, Hermit crab.

The influence of laboratory acclimatization to various temperature-salinity combinations on the heat tolerance of the hermit crab, Diogenes bicristimanus, was determined. In experiment I, the temperature of 50% survival in (1) base line (35 deg C and 30% salinity), and acclimatized at (2) 35 deg C and 30%, (3) 35 deg C and 5%, (4) 22 deg C and 30%, (5) 22 deg C and 5% were 38.3 deg C, 45.1 deg C, 40.4 deg C, 32.7 deg C, and 31.5 deg C, respectively. In experiment II, the temperatures of 50% survival in (1) base line (22 deg C and 5%), and acclimatized at the same combinations as in experiment II. (2), (3), (4), and (5) were 27.0 deg C, 38.2 deg C, 37.4 deg C, 30.8 deg C, and 29.05 deg C respectively. It was concluded that acclimatization to a high temperature generally increased resistance to lethal temperature, whereas acclimatization to low salinity generally decreased it. High temperature and high salinity was the most favorable acclimatization combination to withstand the high test temperature. Gain in heat tolerance, whether the salinity was low or high, was rapid. TEMPERATURE, REPRODUCTION AND BEHAVIOR,
Battelle Memorial Inst., Richland, Wash.
Charles C. Coutant.
Chesapeake Science, Vol. 10, No. 3 and 4, p 261-274, Sept-Dec, 1969, 15 fig, 2 tab, 2 ref.

Descriptors: *Salmon, *Thermal pollution, *Fish reproduction, *Fish behavior, Nuclear reactors, Fishing, Trout, Periphyton, Fish eggs, Water temperature, Columbia River, Spawning, Fish migration, Predation, Tagging.

Current research being conducted on salmonid fishes at the Hanford nuclear complex on the Columbia River is discussed. Studies of thermal effects on reproduction are concerned with two questions. Will the locally spawning fall race of chinook salmon continue to spawn in river areas affected by thermal discharges and will eggs spawned in warmed water have abnormal rates of mortality and growth. In answering these questions, a 20 year, annual census of spawning chinook salmon near reactor discharges and laboratory experiments on incubation and rearing success at elevated temperatures were undertaken. The results showed that a slight temperature rise of only 4 deg F gives a mortality rate that is still permissible, however, greater temperature rises often create mortality rates that are too great. Nevertheless, the higher temperatures help develop a larger size of young salmon which are more capable of protecting themselves against their natural enemies. Currently, investigations concerning the affected behavior of salmonids are underway. Major emphasis is on the problem of loss of equilibrium, changes in susceptibility to predation, and changes in migration paths of adult chinook salmon. (Osborne-Vanderbilt)

THE EFFECT OF BIOLOGICAL LIFE ON THE DISSOLVED OXYGEN CONCENTRATION IN THE DELAWARE RIVER,
Drexel Univ., Philadelphia, Pa. Dept. of Civil Engineering.
William L. Zemaitis, and Geraldine V. Cox.
Prepared for the City of Philadelphia Water Department. Drexel University, Department of Civil Engineering, Philadelphia, July 1970. 13 p, 10 fig, 6 tab, 131 ref. Work No. P-244, Contract No. 88-2239.

Descriptors: *Sludge worms, *Dissolved oxygen, *Eutrophication, *Biochemical oxygen demand, *Chemical oxygen demand, *Water pollution sources, *Water pollution effects, *Organic matter, *Oxygen sag, *Impaired water quality, *Estuaries, *Delaware River, Vegetation effects, Sludge, River beds, Algae, Mathematical models.
Identifiers: *Delaware Estuary, *Biological life, *Dissolved oxygen concentration.

Describes an investigation of the effects of biological life on the dissolved oxygen content in the Delaware Estuary. Biological, chemical, and physical tests were conducted for eighteen months. Benthal surveys revealed that turbificids (aquatic worms), algae, rooted aquatics, and terrestrial vegetation were present. The turbificids were predominant invertebrate species in the sludge deposits, and the population was great where the sediment contained large amounts of organic compounds. Respiration of mixed communities of invertebrates was determined to be as high as 4.2 mg/l of oxygen per gram of turbificids. One dead gram of dead turbificids was found to create a BOD5 of 200 mg/l. Toxic pollution, with a resulting total kill of turbificids in a region, could cause a 20,000 mg/l/m2 BOD5. The BOD/COD ratio increases represent a very significant secondary pollution of the estuary. A significant amount of natu-

l organics in the form of algae and other vegetaon was found. Settlement of these organics in ower moving waters causes enrichment of the ediment and produces a dissolved oxygen sag elow Trenton during high flow periods when botm scouring takes place. Macrofauna metabolism nd algae oxygenation and deoxygenation were not corporated into mathematical models (developed y others) for the Delaware Estuary. The authors ate that the waste allocations determined from ese models might have differed greatly if all arameters had been considered. Recommendaons for further studies are given. (Poertner)

OLLUTION OF ESTUARIES,
Geological Survey, Washington, D.C.
. L. Cory, and J. W. Nauman.
Marine Pollution Bulletin, Vol 1 (NS), No 6, p 87-1, June 1970. 5 p, 2 fig, 3 tab, 3 ref.

Descriptors: *Water pollution effects, *Productivity, *Estuaries, *Thermal pollution, *Maryland, Eutrophication, Nutrients, Thermal powerplants, Heated water, Animals, Environmental effects.
Identifiers: Patuxent Estuary (Md).

The biological effects of industrial effluent discharged into a number of estuaries on the US Atlantic seaboard were examined during the past 7 years. The consequences of discharging hot water from a power station and pulp mill effluent on the epifauna of the estuaries of the North Newport and Patuxent rivers, are discussed. The production of dry weight by the epifauna during 1967 was 2.8 times greater in the power station effluent than in the intake canals. There was also an increase in the numbers of barnacles and hydroids in the effluent canal as well as an extension of settlement; that is, they settled earlier in the spring and later in the fall. Outside the confines of the discharge canal of the power station there was a significant increase in epifaunal production at two stations: one upstream and one downstream from the point of discharge. Both stations produced more dry weight than the uppermost station. The change to highest production in the vicinity of the power station is the result of a combination of increased temperatures, downriver shift of high production waters and an increase in the numbers of attaching larvae. There was also downriver change in species composition and a decrease in species diversity. (Knapp-USGS)

DETERGENTS, PHOSPHATES, AND WATER POLLUTION,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
P. D. Goulden, W. J. Traversy, and G. Kerr.
Canada Department of Energy, Mines and Resources Inland Waters Branch Technical Bulletin No 22, 1970. 8 p.

Descriptors: *Water pollution effects, *Phosphates, *Nitrates, *Nutrients, *Eutrophication, Algae, Surfactants, Water pollution sources, Surface waters, Water pollution, Domestic wastes, Municipal wastes.
Identifiers: Canada.

This report was prepared to provide the general public with technical information on detergents and the effects of phosphates on the water environment. It answers some of the more commonly-asked questions regarding phosphate-based detergents--what they are, what they contain, how they work and how they affect the quality of our water resources. The property of biodegradability as it applies to detergents is explained. While phosphates and nitrates do not in themselves pose any threat to health at the concentrations involved after diffusion in receiving waters, they do possess nutritive properties which encourage the excessive growth of algae and other forms of undesirable aquatic vegetation. When large amounts of this vegetation decompose at the end of the growing period, depletion of the vital life-sustaining dissolved oxygen in water occurs. This form of pollution, which is caused by excess nutrient enrichment, is also referred to as eutrophication and in its extreme form results in the accelerated aging or dying of lakes. (Knapp-USGS)
W70-09388

RELATION BETWEEN THE 'ITAI-ITAI' DISEASE AND THE POLLUTION OF RIVER WATER BY CADMIUM FROM A MINE,
Okayama Univ. (Japan). Ohara Inst.
J. Kobayashi.
Presented at the 5th International Water Pollution Research Conference, held in San Francisco, July - August, 1970. 7 p, 2 ref, 3 tab, 6 fig. U.S.P.H.S. Grant WP-00359.

Descriptors: *Public health, *Heavy metals, *Water pollution sources, *Water pollution effects, *Mine drainage, Mine water, Waste water (Pollution), On-site investigations, Calcium, Human diseases, Bioassay, Toxicity, Poisons.
Identifiers: *Cadmium, Jintsu River (Japan), *Itai-Itai disease, Zinc, Lead, Agricultural damage, *Calcium metabolism.

As a consequence of the discovery of a high content of x Cd, Zn, and Pb in the tissues of the patients suffering from itai-itai disease in a restricted district along the Jintsu River in Japan, there was a strong presumption that the cause of the disease was chronic poisoning by heavy metals found in the waste water from a mine. The following observations were made: (1) Itai-itai disease and damage to rice plants by the waste water appeared in the same place along the banks of the river and decreased at the same time. (2) A heavy accumulation of Cd and other metals was found in the patients' bones, internal organs, soil, and plants. (3) In a laboratory experiment the group of rats which was fed Cd excreted more Ca than that assimilated from the feed, while the control group showed the contrary phenomenon. Thus, the loss of mineral components from the bones was ascertained to be caused by Cd. From these results, it was made clear that the itai-itai disease was induced by cadmium in the waste water from a mine. (Sjolseth-Washington)

EFFECTS OF SUBLETHAL DDT ON A SIMPLE REFLEX IN BROOK TROUT,
Fisheries Research Board of Canada, St. Andrews (New Brunswick).
J. M. Anderson, and H. B. Prins.
Journal of the Fisheries Research Board of Canada, Vol 27, p 331-334, 1970.

Descriptors: *DDT, Pesticide toxicity, Brook trout, Water pollution effects, *Fish behavior, *Fish physiology, Laboratory tests, Laboratory equipment, Persistence.
Identifiers: Central nervous system, *Conditioned response, Learning, Simple reflex.

Brook trout were conditioned in about 30 trials to exhibit the propeller-tail reflex, with electric shock as the unconditioned stimulus and light as the conditioning stimulus. When the trout were exposed for 24 hr to sublethal DDT (20 ppb), more than half could not be conditioned at all; the remainder required significantly more trials than did the untreated ones. Three to four weeks after initial testing, the DDT effect had largely disappeared. It seemed likely that the DDT WAS ACTING UPON CENTRAL NERVOUS SYSTEM STRUCTURES. The general ecological implications of the results are discussed. (Sjolseth-Washington)

TOXICITY STUDIES WITH AN OIL-SPILL EMULSIFIER AND THE GREEN ALGA PRASINOCLADUS MARINUS,
University Coll. of Wales, Aberystwyth. Dept. of Botany.
A. D. Boney.
Journal of the Marine Biological Association of the United Kingdom, (1970), p 461-473. 14 ref, 4 tab, 4 fig.

Descriptors: Bioassay, Toxicity, *Emulsifiers, Detergents, Oil, *Oil wastes, Oily water, Oil-water interfaces, Water pollution treatment, Water pollution effects, Environmental effects, Algal poisoning, Algae, Solvents, Surfactants, Water temperature, Plant pigments, Plant physiology, *Plant pathology, Plant growth regulators, Salinity, Plant populations.
Identifiers: *BP 1002, *Green algae, Prasinocladus marinus, Temperature effects.

Cyst phases of the green alga Prasinocladus marinus have been used in an investigation of the toxic properties of an oil-spill emulsifier BP 1002, and of its solvent and surfactant fractions. Various aspects of a rejuvenation process have all been utilized as a means of assay in addition to observations on cell viability. The 'aged' cysts were more tolerant of all types of toxic agents than were the young non-motile cells. The surfactant fractions were more toxic when used alone, and the solvent fraction alone more toxic than the compounded BP 1002. The application of any of the toxic agents at low temperature (4 deg. C) resulted in a marked reduction in their effects at high concentrations (e.g. 500 ppm). The toxic effect was appreciably increased with both 'aged' and 'young' cells when accompanied by a lowering in salinity. Aeration of the toxic solutions caused a significant lowering of toxicity with both BP 1002 and the solvent fraction. Chloroplast pigment regeneration in 'recovering' cysts was a sensitive means of assaying toxic effects. (Sjolseth-Washington)
W70-09429

AMMONIA TOXICITY IN SELECTED FISHES,
Missouri Univ., Columbia. Dept. of Agricultural Chemistry.
R. P. Wilson, R. O. Anderson, and R. A. Bloomfield.
Comparative Biochemistry and Physiology, Vol 28, p 107-118, 1969. 30 ref, 5 fig.

Descriptors: *Ammonia, Bioassay, *Toxicity, Lethal limit, Ammonium compounds, Rainbow trout, Channel catfish, Resistance, Water temperature, *Fish physiology, Laboratory tests, Enzymes, Biochemistry, Environmental effects, Water pollution effects.
Identifiers: *Ammonium acetate, Goldfish, Ammonotelic fish, Uricotelic fish, Ureotelic fish, *Ammonia toxicity, LD50.

Intraperitoneal LD50 and LD99.9 values for ammonium acetate were determined in three species of ammonotelic fishes; rainbow trout (Salmo gairdnerii), channel catfish (Ictalurus punctatus) and goldfish (Carassius auratus). There was a direct relationship between the LD50 values for ammonium acetate and the relative resistance to environmental conditions, i.e., the trout were the most sensitive, the channel catfish intermediate and the

goldfish quite resistant. An increase in aquarium temperature considerably decreased the fishes tolerance to the injected ammonium acetate. Fishes being ammonotelic were found to be more tolerant to the intraperitoneally administered ammonium acetate than either the ureotelic or uricotelic species. Several factors which may contribute to the higher tolerance of exogenous ammonia in the fishes are discussed. (Sjolseth-Washington)

EFFECTS OF DIQUAT ON BLUEGILLS AND THEIR FOOD ORGANISMS,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
Philip A. Gilderhus.
The Progressive Fish-Culturist, Vol 29, No 2, April 1967. p 67-74, 11 ref, 5 tab.

Descriptors: *Diquat, *Sunfishes, Toxicity, Herbicides, Fish physiology, Growth rates, *Fish Food organisms, Aquatic weed control, Water pollution effects, Persistence, Bottom sediments, Spawning, Zooplankton, Daphnia.
Identifiers: Cladocera, *Spawning success, *Diquat residues.

Diquat appeared to be nonhazardous to bluegills in moderately hard water. The fingerlings did not appear to be effected in any way by the herbicide. Hematological and histopathological examinations of adult fish failed to reveal any effect of the chemical. The differences in growth rates of adults from pool to pool appeared to be a function of survival and total weight of fish in the pools, and could not be related to concentration of the chemical. The herbicide showed an acute toxicity to cladocera. In most of the pools, however, the populations of cladocera built up to normal levels after the diquat had disappeared from the water. (Sjolseth-Washington)

Descriptors: *Copper sulfate, *Molluscacides, *Evaluation, *Snails, Chemcontrol, Piscicides, Toxicity, Mortality, Fishkill, On-site investigations, Copper compounds, Lethal limit, Bioassay, Water pollution effects.
Identifiers: *Cuprous chloride, Iran, *Bulinus truncatus.

The molluscicidal effectiveness of CuCl was compared to that of CuSO4. In the laboratory in the absence of mud, the compounds were equally effective against Bulinus truncatus in the range 2-32 ppm. using 1-or 13-day-old solutions, but CuCl was more lethal in 43- or 91-day-old solutions. When the experiment was repeated in the presence of mud, CuSO4 was more effective initially (25-400 ppm.). Both, however, rapidly lost their effectiveness when mud was present, and the initial concentrations required were too high to use the compounds effectively for their residual activity. The compounds were then tried on some ponds. For both, 30 ppm. killed and snails immediately, but 9 days later there was no residual activity in the ponds. CuCl at 10 ppm. was as piscicidal as CuSO4, with all fish dying within 96 hrs. Since both compounds are piscicidal as well as molluscicidal, neither is recommended under the field conditions used. PRELIMINARY RESULTS OF THE EXPERIMENTS ON THE TOXICITY OF OIL COUNTERACTING AGENT (ESSO COREXIT 7664), WITH AND WITHOUT IRAQ CRUDE OIL, FOR SELECTED MEMBERS OF MARINE PLANKTON,
Institut fuer Fischerei, Hamburg (West Germany).
S. A. Latiff.
Archiv fuer Fischereiwissenschaft, Vol 20, Nos 2/3, p 182-185, 1969. 3 ref, 2 tab.

Descriptors: *Bioassay, Oily water, *Oil wastes, Oil-water interfaces, Water pollution effects, Water pollution sources, *Toxicity, *Emulsifiers, Oil, Water pollution treatment, Crustaceans, *Zooplankton, Lethal limit.
Identifiers: *Esso corexit 7664, *Crude oil, *Marine plankton, Pleurobrachia pileus, Coelenterates, Polychaetes, Oil-ex, Anti-oil TS 5, Sillarit, Moltoklar, Peroklean, Slix, Elimax, Gamlen.

Corexit was less toxic than Oil-Ex, Anti-Oil TS 5, Sillarit, Vecom B 24, Struktol J 502, PS 777, Gamlen, Elimax, Slix, Peroklean and Moltoklar (other oil counteracting agents). The addition of crude oil as in the case of Sillarit or Struktol J 502 reinforced the toxicity of Corexit. The lethal limits of corexit for P. pileus, spionid larvae and young Crangon crangon without Iraq crude oil were 0.667, 0.889 and 1.600 ml/l sea water respectively; the corresponding figures after the addition of crude oil were brought down to 0.222, 0.222 and 0.364 ml/l sea water respectively. EFFECT OF TEMPERATURE SHOCK ON THE TEMPERATURE RESISTANCE OF POIKILOTHERM AQUATIC ANIMALS. EXPERIMENTS ON THE PROBLEM OF HEAT AND COLD-HARDENING IN ANIMALS (GERMAN),
Kiel Univ. (West Germany).
Thies Basedow.
English summary. Internationale Revue der Gesamten Hydrobiologie, Vol 54, No 5, p 765-789, 1969. 64 ref, 15 tab, 16 fig.

Descriptors: *Thermal stress, Environmental effects, *Resistance, Laboratory tests, *Acclimatization, Water pollution effects, Fish behavior, *Fish physiology, *Cold resistance, Water, *Heat resistance, Heat treatment, Eels, Mollusks, Invertebrates.
Identifiers: *Temperature effects, Temperature resistance, *Adaptation.

After a sublethal heat shock the heat resistance of the fishes Idus idus and Xiphophorus helleri and the newt Triturus vulgaris undergoes a slight but statistically significant increase for a short time. The heat resistance of IDUS idus equally rises after more moderate, but longer lasting heat shocks. After a shock-transfer and maintenance in extremely high temperatures the three fish-species examined do not show a 'heat-hardening' discernible from the heat-adaptation. Sublethal heat shock and shock-transfer in extremely high temperatures have the same effect on the heat resistance of Idus idus. In the biological range of temperature of Idus idus and Anguilla vulgaris the rate of heat-adaptation increases with temperature. The results on the three invertebrates examined, Dinophilus gyrociliatus, Dreissena polymorpha, and Laomedea loveni, do not make necessary a distinction between a heat-hardening and a heat-adaptation. The problem of hardening is discussed in several aspects. The results can be interpreted as a resistance adaptation. (Sjolseth-Washington)

ALGAL CANCER AND CAUSAL SUBSTANCES IN WASTES FROM THE COAL CHEMICAL INDUSTRY,
Kyushu Univ., Fukuoka (Japan). Dept. of Fisheries Chemistry.
S. Ishio, T. Yano, and R. Nakagana.
Presented at the 5th International Water Pollution Research Conference, held in San Francisco, July-August 1970. 8 p, 13 ref, 7 fig, 1 tab.

Descriptors: *Public health, Foods, Water pollution effects, *Water pollution sources, Chemical wastes, Industrial wastes, Laboratory tests, Bottom sediments, Chromatography, Analytical techniques, Plant pathology, Plant growth regulators, *Plant disease.
Identifiers: *Algal cancer, *Porphyra tenera, *Benzanthrone, *Carcinogenic compound, Coal chemical industry.

Carcinogenic compounds which induce the algal cancer of Porphyra tenera were extracted with acetone from the bed mud polluted by wastes from the coal chemical industry. The extracts were separated in ether solution into bases, acids and neutrals. The most intensive carcinogenic potency was found in the neutral compounds. The neutrals gave two carcinogenic compounds. One was confirmed to be benzanthrone, another was a new hydrocarbon with the molecular formula C2 5H14. Benzanthrone brought about the algal cancer to all leaves of Porphyra tenera within 40 days at 10 deg C in a concentration as low as 0.2 ppm. (Sjolseth-Washington)

ANIONIC AND NONIONIC SURFACTANT SORPTION AND DEGRADATION BY ALGAE CULTURES,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
Ernst M. Davis, and Earnest F. Gloyna.
Journal of the American Oil Chemists' Society, Vol 46, No 11, p 604-608, 1969. 9 ref, 2 fig, 3 tab. NSF Grant NSF-GU-1963.

Descriptors: *Linear alkylate sulfonates, *Surfactants, Water pollution sources, *Detergents, *Degradation (Decomposition), Cyanophyta, Chlorophyta, *Algae, Sorption, Waste water treatment, Cultures, Chlorella, Water pollution effects.
Identifiers: *Alkyl poly ethoxylate, *Alkyl phenol polyethoxylate, Anionic surfactants, Nonionic surfactants, Infrared spectra.

Degradation of three surfactants has been determined by organic extraction procedures and infrared spectroscopy. Axenic cultures of five species of blue-green algae and three species of green algae which are common to waste stabilization ponds were test organisms. Analytical data are shown comparing the effects produced by the algae cultures and a heterogeneous microcosm. Linear alkyl

lfonate was the anionic surfactant compound sted. An alkyl polyethoxylate and an alkyl phenol olyethoxylate were the nonionic test surfactants. orption of the compounds by the algae usually was llowed by release and degradation of up to 99% some of the component parts of the surfactant olecule. D. Waste Treatment Processes

RITISH WATER POLLUTION CONTROL,
amuel H. Jenkins.
nviron Sci Technol, Vol 4, No 3, p 204-209, Mar 970. 6 p, 5 fig.

escriptors: Water pollution, *Water pollution ontrol, Water quality, Water pollution treatment, Vater quality control, Water reuse, Municipal astes, *Sewage treatment, Water treatment, Vater works, Sewage works, Waste water treatent, Waste water (Pollution), Inspection, *Indusial waste treatment, Sewage effluents, Foreign ountries.
lentifiers: Water quality standards, Municipal ewers, *Great Britain.

t a time when most industrial nations are seeking control pollution of inland waters by stricter laws r new legislation, Britain can claim that many of s rivers are now in better condition than they were 0 yr ago. Regional pollution control authorities, oint treatment of industrial and municipal waste vater, and an effective inspectorate system are key eatures of Britain's pollution control program. Manufacturers have the right to discharge effluents nto public sewers. Municipalities owning the ewers have the power to set conditions for the ischarges. River authorities are responsible for ontrolling pollution of surface and underground vaters. The fact that effluents from municipal ewage treatment plants must meet requirements of he river authorities, and the law that requires muicipalities to receive industrial waste have compelled local authorities to control discharge of hese wastes to public sewers. To ensure that manufacturers comply with the legal consent received rom the municipalities, local authorities maintain an inspectorate service. Inspectors have powers of entry to take effluent samples. (USBR)

EFFECTIVE PHOSPHORUS REMOVAL BY THE ADDITION OF ALUM TO THE ACTIVATED SLUDGE PROCESS,
Metropolitan Sanitary District of Greater Chicago, Ill.
David R. Zenz, and Joseph R. Pivnicka.
Paper presented at the 24th Annual Purdue Industrial Wastes Conference, May 6-8, 1969. 59 p, 34 fig, 4 tab, 21 ref.

Descriptors: *Phosphorus, *Phosphates, *Phosphorus compounds, *Chemical precipitation, *Chemical degradation, *Biological treatment, *Biodegradation, *Biochemistry, *Biochemical oxygen demand, *Waste water treatment, *Water pollution control, *Eutrophication, *Algal control, *Tertiary treatment, Suspended load, Pilot plants, Activated sludge, Treatment facilities.
Identifiers: *Phosphorus removal, *Alum, *Aluminum sulfate, *Activated sludge process, Hanover treatment plant.

The objective of this experimental research was to evaluate, under actual waste water treatment plant operating conditions, a combined chemical-biological process capable of producing an effluent low in phosphorus, BOD and suspended solids. Tests were conducted at the Hanover Park Water Reclamation Plant in Cook County, Illinois. The plant consists of a 2 mgd conventional activated sludge facility and a tertiary facility capable of treating the entire flow from the secondary facility. The secondary plant was separated into two distinct systems for the tests. Alum was added to the influent of the aeration tank of one system by a feed pump. Effluent samples, taken automatically as 24-hour composites, were analyzed for BOD, SS, VS, per cent total solids, per cent volatile solids, alkalinity, S.V.I and NH3-N. An Autoanalyzer was used for phosphorus determinations. It was found that the process can produce effluent phosphorus concentrations of 2.30 mg/l (total P) and 0.83 mg/l (soluble P) at a Al:Total P Ratio (molar basis) of 1.54 and a Al:Soluble P Ratio of 1.85. This is 83 and 93 per cent removal, respectively. Bound phosphorus was not released during anaerobic digestion. Additions of large amounts of alum did not adversely affect BOD removal efficiency, but removed higher microbial life forms in the mixed liquor. The suspended solids increased at an alum concentration of 252 mg/l. Waste sludge increased, and S.V.I decreased. Alum did not upset the anaerobic biological treatment process. (Poertner)

REDUCING WASTE ACTIVATED SLUDGE VOLUME BY ANEROBIOSIS,
San Jose-Santa Clara Water Pollution Control Plant, San Jose, Calif.
Edward R. Becker.
Report 1968. 78 p, 26 fig, 5 tab, 31 ref. FWPCA Demonstration Grant WPC-129-01.

Descriptors: *Anaerobic digestion, *Anaerobic conditions, *Anaerobic bacteria, *Activated sludge, *Aeration, *Anaerobic treatment, *Biological treatment, *Sewage bacteria, *Sewage treatment, *Sludge treatment, *Waste water treatment, Solids contact process, Pilot plants.
Identifiers: *Anaerobiosis, *Waste activated sludge, Sludge volume reduction.

Description of a pilot plant demonstration of the feasibility of incorporating anaerobiosis in the activated sludge waste water treatment process to compact and reduce the volume of waste activated sludge. The process is viewed as a method that might be economically attractive to many communities that employ activated sludge treatment methods. A 12 per cent reduction in total waste sludge volume and a 22 per cent reduction in weight was exhibited. Possibilities of reducing pollution problems from effluents of secondary treatment plants by decreasing nitrites, nitrates, and phosphates were demonstrated. A pilot plant was designed and constructed to simulate the operating conditions of the San Jose - Santa Clara Water Pollution Control Plant. Two physically identical secondary treatment units were provided, except that an anaerobic holding tank was added to one unit. The major plant primary effluent was used as a common influent to both units. Settled activated sludge withdrawn from the final clarifier was held for detention periods of 0, 4, 6, 8, and 12 hours in the anaerobic holding tank. Samples of waste activated sludge were withdrawn regularly from both units and analyzed daily to evaluate the effectiveness of anaerobiosis in reducing waste sludge volumes. The optimum period of anaerobiosis developed with a four-hour sludge-detention period. (Poertner)

ODOR CONTROL METHODS, EXPERIMENTATION AND APPLICATION,
Los Angeles County Sanitation District, Calif.
Jay G. Kremer.
Report, 1969. 71 p, 36 fig, 13 tab, 79 ref.

Descriptors: *Odor, *Air pollution effects, *Organoleptic properties, *Waste water treatment, *Activated carbon, *Activated sludge, Pilot plants, Hydrogen sulfide, Sulfur, Cost comparisons.
Identifiers: *Odor control, *Odor evaluation, Activated sludge scrubber, Turbulent contact absorber scrubber.

Describes the field and laboratory investigations conducted by the County of Los Angeles Sanitation Districts to develop methods, procedures and equipment for odor control of air flows from wastewater treatment plants. The objectives of the project were to: develop means to quantitatively evaluate odor concentrations; formulate systems for removing odors; evaluate the systems for practicality and effectiveness; and determine costs of odor removal. A literature search revealed scant knowledge of practical methods of odor control. A method patterned after ASTM D1391 was found effective and of sufficient accuracy for making quantitative evaluations of odors. A special odor evaluation room was constructed and equipped for odor evaluations by male and female students from a nearby college. Pilot plants were constructed and tested to evaluate various methods of removing odors from air flows of waste water. These included: a conventional activated sludge scrubber; a packed-tower turbulent contact liquid scrubber using activated sludge and various chemicals; and activated carbon absorbtion. Cost comparisons, advantages, and capacities are described for the above methods and for fume incineration. A successful application of activated carbon for odor removal was made at a waste water pumping station. (Poertner)

Identifiers: *National Aeronautics and Space Administration, Life support systems.

One of the vital spacecraft life support systems is that used to supply water. Short duration missions allow storage of sufficient water, but for long duration missions, the weight of such a supply becomes unacceptable. This paper reviews techniques for recovering potable drinking and wash water from spacecraft waste water. Emphasis is placed on problem areas which exist in such recovery and which may be suitable topics for university type research. Areas covered include nature of waste waters which might be processed, potability requirements and monitoring techniques, existing and possible future recovery techniques, means of selecting a suitable technique from a number of different types, and problems of a fringe nature such as means of monitoring body mass to keep track of human water exchange. An attempt is made to stimulate new ideas based on present knowledge. (Knapp-USGS)

IN-PLANT WASTE REDUCTION,
Humble Oil and Refining Co., Baytown, Tex.
Sidney O. Brady.
Journal of the Water Pollution Control Federation, Vol 41, No 8, p 1516-1523, August 1969. 4 fig.

Descriptors: *Industrial wastes, *Oil wastes, *Waste water disposal, *Waste disposal, *Reduction, *Waste water treatment, Disposal, Chemicals, Operations.
Identifiers: *Process modification, *Refinery, Petroleum wastes.

In-plant waste reduction covers a multitude of practices many of which are preventive in nature. These practices play an important role in reducing the overall waste discharge from an industry, but in many areas probably are not considered as part of the waste control effort. Five preventative measures are discussed: (1) design, (2) process modification, (3) recovery and utilization, (4) local pretreatment or disposal, (5) operation control. Each measure is discussed from the petroleum industries viewpoint. Engineering design considerations commonly used are (a) separate drainage and sewer systems, (b) segration of waste water streams, and (c) water conservation. Design modifications that effect waste control and that may be considered as preventative measures are process selection and process and chemical losses. A special type of process design which contributes to economical waste reduction is that of waste plants to simple collection and sale of the chemicals. Several examples are given of local pretreatment or disposal which is performed in-plant. The dilemma confronting those agencies concerned with making a pollution loading charge versus raw material consumed is presented. The vast number of plants is different products, processes, etc., make this type of comparison impossible. (Hancuff-Texas)
W70-09316

FILTRATION OF WASTE PLANT EFFLUENTS,
Wayne State Univ., Detroit, Mich.
Henry A. Dirasian.
Water and Sewage Works, Vol 117, No 3, p 84-88, March 1970. 4 fig, 4 tab, 9 ref.

Descriptors: *Waste Water treatment, *Materials, *Effluents, *Filtration, *Diatomaceous-earth, Activated carbon, Flyash, Biochemical oxygen demand, Chemical oxygen demand.
Identifiers: Suspended solids.

The combination of filtration characteristics of diatomaceous earth and adsorptive properties of activated carbon provided efficient removal of contaminants from waste water treatment plant effluents. The study was broken down into 3 phases: (1) diatomaceous earth alone was used as the filtering medium, (2) diatomaceous earth was used with varying concentrations of activated carbon and, (3) flyash alone constituted the filtering medium. The results of this feasibility study have verified the hypothesis that additional treatment of waste treatment plant effluents is possible using filter aids with pressure type filters. Best results were obtained using diatomaceous earth as the filtering medium with the inclusion of activated carbon. Results with flyash filter were not very impressive. It appears desirable to continue studies on the flyash filter since it is believed that properly graded and washed flyash could yield BOD and SS removals substantially higher than those attained. Since the study was a feasibility type, no attempt was made to determine the most efficient methods of operation nor any detailed cost analysis. (Shankar-Texas)

POLYMER PLUS MAGNETIC FIELD USED TO TREAT PARAMAGNETIC SLURRIES,
Jones and Laughlin Steel Corp., Pittsburgh, Pa.
D. F. Peck, and T. J. McBride.
Water and Sewage Works, Vol 116, No 11, November 1969. 9 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Waste water, *Flocculation, Magnetic studies, *Slurries sedimentation.
Identifiers: *Polymer, Paramagnetics, Settling rate, Oxygen furnance, Suspended solids, Magnetic-polymer process.

Certain aqueous steel mill wastes have proven difficult to treat from the standpoint of color and solids removal. Conventional treatment facilities require low over-flow rates and sizeable space requirements. The development of a new process which improves solids separation from the paramagnetic waste slurries is discussed. The process consists of (1) treatment with an anionic polymer and (2) controlled exposure to a magnetic field prior to settling in conventional equipment. Settling rates by the magnetic-polymer process have been shown to be higher than any other treatment for similar wastes. The polymer which gave the best results when used in combination with a magnet was a high molecular weight water soluble anaionic material of the polyacrylamide class. A brief account of proposed mechanics of double floccing for paramagnetic slurries is presented. A summary of advantages of the magnetic-polymer flocculation process as applied to paramagnetic slurries is given. The combination process results in a high degree of apparent color removal. (Shankar-Texas)

ADVANCES IN HANDLING GAS CHLORINE,
Capitol Controls Co., Inc., Colmar, Pa.
Gerald F. Connell, and John J. Fetch.
Journal of the Water Pollution Control Federation, Vol 41, No 8, p 1505-1515, August 1969. 7 fig, 10 ref.

Descriptors: *Chlorine, *Chlorination, *Materials, *Safety, *Plastics, Gases, Oxidation, Temperature, Disinfection, Waste water treatment.
Identifiers: *All-vacuum chlorination system, *Chemical handling.

The method of gas chlorination in comparison with powder and liquid techniques is more advantageous than the other disinfection techniques because of economics and safety. An improvement to the vacuum operated solution feed system is presented in the form of the all-vacuum method of chlorination whereby the chlorinator is mounted directly on top of the chlorine cylinder. Several chlorine myths are discussed such as: chlorine explosions or burning. The element chlorine is non-explosive, will not burn, and is heavier than air. The economics and safety of liquid bleach versus gaseous chlorine are discussed, and it is shown that gas is the most economical technique for feeding chlorine because it requires less material and has least cost per pound. Other misunderstood facts about chlorination are also discussed such as 'frozen' chlorine lines. Internal and external materials of construction are discussed as well as other safety aspects. (Hancuff-Texas)

BAFFLED BIOLOGICAL BASIS FOR TREATING POULTRY PLANT WASTES,
Syracuse Univ., N.Y.
Nelson L. Nemerow.
Journal of the Water Pollution Control Federation, Vol 41, No 9, p 1602-1612, September 1969. 8 fig, 9 tab.

Descriptors: *Biological treatment, *Oxidation, Lagoons, *Baffles, *Waste water treatment, *Poultry, Industrial wastes, Lagoons, Ponds, Photosynthesis, Costs, Efficiency, Biochemical oxygen demand, Algae, Sedimentation, Settling basins.
Identifiers: *Chickens, Food wastes, Poultry wastes.

A poultry plant in Millsborough, Delaware, processed 10,000 chickens per hour with a waste water of 40,000 gph, and an effluent of 2,500 lb BOD5/day at an average BOD of 630 mg/l. Because the area is commercially and recreationally of great value a program was initiated to reduce the waste water concentration at a maximum cost of $100,000. Adequate screening followed by a two-stage oxidation pond plant utilizing over and under contact baffles in the first stage followed by chlorination provided a 85 to 95% BOD reductions. The first stage consists of a baffled high-rate deep pond. The second state is a shallow synthetic basin. Loadings of over 200 lb/day/acre resulted in high efficiency and coliform counts of less than 10/1000 ml. The final cost was $90,000. (Hancuff-Texas)
W70-09320

EFFECT OF RECIRCULATION ON DEEP TRICKLING FILTER PERFORMANCE,
Regional Inst. of Tech., Jamshedpur (India).
V. Hanuamanulu.
Journal of the Water Pollution Control Federation, Vol 41, No 10, p 1803-1806, October 1969. 2 fig, 2 tab, 4 ref.

Descriptors: *Trickling filters, *Sewage treatment, *Waste water treatment, *Performance, Efficiencies, Biochemical oxygen demand, Filters.
Identifiers: *Secondary treatment, *Recirculation, *Loadings.

Three trickling filters of 12 foot media depth at Dadar-Bombay Wastewater treatment plant were studied to determine the effect of recirculation on efficiency. One was provided with recirculation while the other two were without it. The filter with recirculation consisted of closed filter with artificial ventilation by means of blowers. The recirculation ratio was 1, the flow was 1.59 MGD, and the hydraulic loading was 23.6 MGD/acre. The 2 filters without recirculation were loaded at 14.3 MGD/acre and handled 2.4 MGD. Both types of filters were working under the same conditions of media depth, media characteristics, waste water characteristics, temperature and organic loading. The filter with recirculation achieved an efficiency of 91% while those without recirculation attained only 52%. Recirculation resulted in distributing the organic loading almost uniformly throughout the depth of the filter. The effect of recirculation will be predominant if the strength of the waste water is high. (Hancuff-Texas)

EUROPEAN WASTE WATER MANAGEMENT AND RESEARCH,
Department of National Health and Welfare, Edmonton (Alberta). Public Health Engineering Div.
Charles P. Fisher, and Hugh R. Eisenhauer.
Water and Pollution Control, Vol 107, No 12, p 26-28, December 1969.

Descriptors: *Industrial wastes, Economics, *Waste water (Pollution), *Waste water treatment, *Management, *Research facilities, *Pollution abatement, Sewage treatment.
Identifiers: Penalties.

A summary of visits to certain outstanding waste water research establishments is presented and some insight into European waste water management practices is gained. Antipollution laws in Italy are lax and apply only to the Fisheries without and references to human health. Rome draws it's drinking water supply from a recreational lake where sewage is directly discharged. Czekoslovakia appears to be fairly advanced in waste water management. A brief sketch of the projects under research in a hydraulic research institute at Bratislava is given. Vienna, a city with a population of 2 million, does not have sewage purification facilities but a plant for the city is presently under design. Germany was found to be the forefront of waste water

agement. Problems of management in Ger-
y led to the creation of Emscher Association by
cial Act passed by the Prussian Diet in 1904.
the industries and municipalities are required
aw to join the Association. In Holland waste
r management seems to be at its highest level.

treatment of waste water from a cattle skin
nery process always has been considered
ause of the high pollutional characteristics of
waste the potential toxic chemicals used in the
cess and the wide variety of both the quantity
characteristics of the wastes over the process
. Treatment criteria were developed for a
ome-tanning waste through which 90% organic
noval was obtained. A completely mixed ac-
ted sludge pilot plant with 3,000 gallons/day
acity was constructed and operated for 27 days
arying loadings. The pilot plant consisted of the
owing basic units. (1) collection troughs and
fall mixing units, (2) influent pump, (3) splitter
k, (4) a primary sedimentation tank, (5) aera-
n tank, (6) secondary sedimentation tank, (7)
lift solids return and (8) blower. The BOD load-
to the pilot plant varied from 42.5 to 80.9
day. Suspended solids loading varied from 47.8
103.6 lb/day. Hydraulic loadings on the primary
imentation tank varied from 216 to 440 gpd/ft
The primary sedimentation unit removed ap-
ximately 40% of the influent BOD and about 50
60% of the suspended solids. BOD loading to the
ation tank ranged from 127 to 272 lb/day/1000
ft. of aeration capacity. The BOD to mixed
uor suspended solids loading varied from 22 to
lb. Aeration times varied from 10.6 to 19.0
urs. The data were adapted to design criteria for
nt treating 10,000 pounds of organics per day
m the tannery and a population of 2,500. (Han-
ff-Texas)

eatment, *Eutrophication, Waste water treat-
ent, Algae, Effluents, Nutrients, Sewage treat-
ent, Lakes.

paper by L. E. Kuentzel published in the October
969 issue of the JWPCF is discussed and evalu-
ed by Shapiro. The discussion is basically a refu-
tion of arguments presented by Kuentzel in his
allenging the efficacy of phosphorus removal for
trophication control. Several works cited, previ-
us to Kuentzel's, supports the fact that reduction
phorphorus in effluents through curtailed use of
etergents or advance waste water treatment will
duce eutrophication of lakes significantly and
ill allow those already severely affected to begin
eir recovery through natural processes. (Han-
uff-Texas)

Identifiers: *Machinery Plant, *Air flotation, Grit removal, Settled Solid, Acidification.

The waste treatment in a Toledo machining plant and the difficulty encountered in treating some of the contaminants such as oil, emulsion cleaners, etc. is explained. The waste water from the factory flows by gravity to a pump and a grit remover screens out all the large solids. The water is transferred to 3 primary clarifiers by a float activated pump. The tanks are provided with drum skimmers for oil removal and Bottom Scrapers move the settled solids to a recess in the floor. After settled solids are floated oils, have been removed, the blended waste is tested to determine whether acidification will remove more oil. The blended water is treated with ammonium sulfate and the pH is adjusted. It is then treated with Air Flotation. Scum is accumulated in a sump from which it is periodically pumped and hauled to an oil reclamation site. The final treatment prior to disposal is sedimentation. The drum skimmers were later abandoned in favor of weirs, since it was noticed that skimmers led to the production of an invert emulsion which resulted in a serious interference in the efficiency of oil removal. Research is underway to increase the amount of recoverable and reusable oil from the treated waste. (Shankar-Texas)

CHARACTERISTICS OF WASTEWATER AT DELHI,
Pahlavi Univ., Shiraz (Iran).
Jatinder K. Bewtra.
Journal of the Water Pollution Control Federation, Vol 41, No 2, p 208-221, February 1969. 6 fig, 10 tab, 12 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Statistics, *Corrleation analysis, *Treatment facility, Biochemical oxygen demand, Probability, Kinetics.
Identifiers: *Rate constant, *Grit removal, *Delhi, Suspended solids, Loading.

Characteristics of waste water from different stages of treatment in Okhla Sewage Works, one of the largest plants in Asia, were studied for three years. Investigated were the characteristics of grit, suspended solids, rate constants for BOD at different temperatures and correlations between waste water characteristics like BOD, volatile and total suspended solids, and volatile and total solids on evaporation. Tests showed that future grit chamber design should allow removal of 0.1 mm size particles of 2.45 specific gravity at a flow of 0.49 ft/sec, mean BOD rate constant values at 20 deg were 0.186, 0.164, and 0.119/days for raw, settled and treated waste water respectively. 60-75% of suspended solids and 45 to 60% BOD were removed from the raw waste water. DIGESTED SLUDGE DISPOSAL ON CROP LAND,
Illinois Univ., Urbana; and Metropolitan Sanitary District of Greater Chicago, Ill.
Thomas B. Hinesly, and Ben Sosewitz.
Journal of the Water Pollution Control Federation, Vol 41, No 5, p 822-830, May 1969. 3 fig, 4 tab.

Descriptors: *Sludge disposal, *Crops, *Agriculture, *Irrigation, *Fertilizers, Stabilization, Digestion, Sludge, Sludge digestion, Nutrients, Trace elements, Odors, Infiltration.
Identifiers: Chicago (Illinois).

After an exhausted study to determine the best solids disposal solution, the Metropolitan Sanitary District of Greater Chicago concluded that digestion followed by land disposal could cope with Chicago's 1000 tons/day of sludge successfully at a cost of $20-$23/ton. Research designed to determine groundwater contamination, the effect of heavy metals and crop irrigation parameters was conducted. At the Northeast Agromony Research Center digested sludge was applied by furrow irrigation at weekly intervals on crop land planted with corn and kenaf. The rates were 1, 0.5, 0.25, and 0 inches for a total of 6 weeks. Average corn yield was 111.9, 114.2, 96.2, and 66.3 bushels per acre, respectively. While all the results are not in for the first years research and demonstration projects on the 8 acre and 30 acre test plots some observations can be summarized. (1) The crops responded favorably to digested sludge. (2) Offensive odors have not been a problem. (3) Flys were never a problem. (4) Furrow irrigation is preferred to sprinkler irrigation. (5) Application of nitrogen in amounts greater than those needed for crop reduction will increase nitrate level in drainage water. (Hancuff-Texas)

BOD AND COLOR REMOVAL FROM KRAFT MILL WASTES,
Nova Scotia Technical Coll., Halifax.
D. Thirumurthi, G. McKenna, and H. G. Bown.
Water and Sewage Works, Vol 116, No 12, p 491-494, December 1969. 4 fig, 3 tab, 9 ref.

Descriptors: *Biochemical oxygen demand, *Color, *Industrial wastes, *Pulp and paper industry, *Aeration, Coagulation, Laboratory tests, Lagoons, Waste water treatment, Mills.
Identifiers: Alum.

The BOD and color removal characteristics from a kraft mill waste by parallel treatment with alum coagulation and a laboratory model aerated lagoon were investigated. Aerated lagoon treatment was confirmed to be an effective system for BOD removal from Kraft pulp mill wastes. However, aeration did not accomplish any significant color reduction. Alum coagulation was efficient in color removal from Kraft mill wastes. At a pH of 6, an alum dose of 0.9 mg/l removed 92.8% of color causing compounds after 5 minutes of settling. However, a bulky sludge (20% of initial waste volume) resulting from sedimentation was a potential nuisance. Under the test conditions, alum coagulation did not render a significant BOD removal. A combination of series, parallel or series-parallel flow systems with alum coagulation and aerated lagoon treatment should be investigated before designing proto-type pollution control facilities for Kraft pulp mills. AERATED LAGOONS TREAT SECONDARY EFFLUENT,
Van-Note-Harvey Associates, Princeton, N. J.
James C. Pierce, Jr.
Water and Sewage Works, Vol 117, No 5, p 162-164, May 1970. 5 fig.

Descriptors: *Activated sludge, *Aeration, *Effluents, *Tertiary treatment, *Lagoons, New Jersey, Waste water treatment.
Identifiers: *Aerated lagoons, *Contact stabilization.

The rapidly expanding population of East Windsor Township, New Jersey required an expansion of their 0.5 MGD contact stabilization plant built in 1966. Plant effluent discharged into the Millstone River, a sluggish stream with low flows in the late

summer. The New Jersey Department of Health promulgated stream standards requiring BOD removals of 90% at all times, including any four hour period that peak flows could come through the plant. One of the disadvantages of the existing treatment plant was the discharge of light, flocculant suspended solids over the settling tank weir during peak flow periods of the day. An additional 0.5 MGD contact stabilization plant was elected for the expansion. Both secondary plants were followed by an aerated lagoon for tertiary treatment. Lagoon aeration was accomplished with an Air-Aqua System. The tertiary lagoon was sized for 4 MGD to provide capacity for future additions. The lagoon did an effective job of handling BOD's and suspended solids discharges of up to 80 mg/l during periods of peak flows. Lagoon effluent contained 12 to 15 mg/l BOD and suspended solids. There were no settleable solids discharged from the lagoon. (Aguirre-Texas)

RESPONSE OF DAIRY WASTE ACTIVATED SLUDGE TO EXPERIMENTAL CONDITIONS AFFECTING pH AND DISSOLVED OXYGEN CONCENTRATION,
Agricultural Univ., Wageningen (Netherlands). Lab. of Microbiology.
A. D. Adamse.
Water Research, Vol 2, p 703-713, 1968. 8 fig, 2 tab, 10 ref.

Descriptors: *Activated sludge, *Dairy industry, *Dissolved oxygen, *Hydrogen ion concentration, Carbohydrates, Industrial wastes, Laboratory tests, Oxygen requirements, Waste water treatment.

When activated sludge was fed a normal amount of artificial dairy waste, a sharp drop of pH and dissolved oxygen (DO) was observed immediately after feeding, due to the ready dissimilation of the carbohydrate fraction of the substrate. Decomposition of the protein fraction started later, proceeded at a much lower rate, and was accompanied by a slight fall of pH and DO for a more prolonged period of time. The drop of pH during dissimilation of the carbohydrate fraction was caused by a transitory occurrence of acid intermediates in suspension. This was assumed to be due to the fact that, in spite of very vigorous aeration, the oxygen absorption rate was unable to meet the increased demand for oxygen and therefore the oxygen absorption rate became a limiting factor in the oxidation of the carbohydrate fraction of the substrate. The difference found between the dissimilation rate of the carbohydrate fraction and that of the protein fraction caused a discrepancy between the potential and actual C/N ratios of the substrate. Analyses of the acid intermediates showed that acetic acid was accumulated in the activated sludge suspension when DO was present, whereas lactic acid was found when DO was absent. (Aguirre-Texas)

THE SEASONAL PERFORMANCE AND THE PATTERNS OF CHEMICAL AND BIOLOGICAL EVENTS IN SEWAGE LAGOONS,
Arizona State Univ., Tempe. Coll. of Engineering Sciences.
John W. Klock.
Engineering Research Center Report, August 1968. 128 p, 66 fig, 13 tab, 85 ref.

Descriptors: *Biological treatment, *Chemical properties, *Effects, *Performance, *Seasonal, *Sewage lagoons, Lagoons, Oxidation lagoons, Ponds, Waste water treatment.

Two experimental lagoons were constructed to study the biochemistry of sewage lagoons and by so doing improve their operation and design for the purpose of economically producing higher quality effluents suitable for reuse in the semiarid Southwest. The program consisted of field studies of the chemical and biological characteristics and cyclic patterns of sequential phase sewage lagoons. Particular interest was devoted to the winter recession and spring recovery and the fate of coliform organisms. The seasonal range of the basic environmental factors encountered in these field studies was (1) incident light intensity (total), 185 to 775 gcal/ (sq cm)-day; (2) air temperature, -7 to 44.5C; (3) influent waste water temperature, 22 to 32C; (4) ambient waste water temperature, 3 to 28C. The Eh-pH diagram was extensively used in describing the sequence of chemical and biological events that constitute the conversion of raw undiluted sewage to, first, a biologically active and fertilized 'treated waste' and secondly, to a relatively stable water. THERMAL ENERGY CONSERVATION AND SEQUENTIAL BIOLOGICAL PROCESSING APPLIED TO SEWAGE LAGOON DESIGN,
Arizona State Univ., Tempe. Coll. of Engineering Sciences.
John W. Klock.
Engineering Research Center Report, October 1968. 28 p, 12 fig, 4 tab, 5 ref.

Descriptors: *Biological treatment, *Conservation, *Design, *Heat budget, *Sewage lagoons, Lagoons, Oxidation lagoons, Ponds, Waste water treatment.
Identifiers: *Thermal energy conservation.

This study incorporated the following principles into a reliable and simply operated lagoon system: (a) thermal energy conservation, (b) sequential phase processing, and (c) utilization of thin plastic films to form channel barriers and heat transfer interfaces. The lagoon was designed on an 8-day flow-through-time with approximately one-half of this period in each of the first and second phases. Phase I was intended to be principally a bacterial culture and phase II was an algal culture followed by limited growth of crustaceans and aquatic insects. The two phases are superimposed to improve heat utilization and prevent premature algal growth and nutrient fixation. Lagoon performance was notable by its treatment uniformity throughout the year, ranging from a low of 75.8 in the fall to a high of 78.9% BOD removal in the spring. The lagoon was clean with minimal surface solids and no odors at any time. The phase I effluent was a clear liquor and the phase II effluent had a pale green of a dilute algal culture. Seasonal performance was evaluated with studies of suspended solids reduction, deposited solids accumulation, Eh-time and pH-time patterns, BOD and COD reductions, presence of H2S and molecular oxygen, and algal activity. TREATMENT OF DAIRY MANURE BY LAGOONING,
Washington State Univ., Pullman.
Surinder K. Bhaghat, and Donald E. Proctor.
Journal of the Water Pollution Control Federation, Vol 41, No 5, p 785-795, May 1969. 9 fig, 7 tab, 6 ref.

Descriptors: *Waste water treatment, *Dairy industry, *Industrial wastes, *Lagoons, *Performance, *Pilot plants, Sewage treatment, Ponds, Biochemical oxygen demand, Anaerobic treatment, Aeration, Design, Nutrients.
Identifiers: *Anaerobic treatment, *Loadings, *Characteristics, *Feed lot wastes.

A series of anaerobic ponds were operated to treat dairy cattle feed lot wastes. Approximate dimensions are pond no. 2 100x50x4, pond no. 3, 150x60x3, and pond no. 4, 30,000 sq ft area and a depth of 3 feet. Tests were run on BOD, COD, and total dry solids, volatile solids, nutrients, pH, and temperature. The ponds operated anaerobically and were satisfactory as primary treatment. Removals were above 86% for loadings of 70lb volatile solids/day/1000 cu ft. The effluents from the lagoon required further treatment. The effluent from the anaerobic lagoon is potent and can be disposed of in either of two ways: (a) applied to t fields, and (b) given further anaerobic treatmer The effluent from the anaerobic lagoons o retains most of the nutrients present in the ra manure waste and thus has fertilizer value. If land not available for the disposal of the effluent fro the anaerobic lagoons, secondary treatment can b provided in the form of aerated lagoons, oxidatio ditches or an oxidation pond. The results of batch-type aerobic treatment indicated that an e fluent BOD of 20mg/l could be achieved by a 2 hour aeration period, when fed the 200mg/l BO effluent from the anaerobic ponds. CONTROL MECHANISMS OPERATIVE IN NATURAL MICROBIAL POPULATIO SELECTED FOR ITS ABILITY TO DEGRAD L-LYSINE, II. EFFECTS OF FRUCTOSE AN RIBOSE IN BATCH SYSTEMS,
Oklahoma State Univ., Stillwater. Bioengineerin Labs.
C. P. L. Grady, and A. F. Gaudy.
Applied Microbiology, Vol 18, No 5, p 785-78 November 1969. 2 fig, 2 tab, 12 ref.

Descriptors: *Activated sludge, *Carbohydrate *Control, *Effects, *Microbiology, Bacteri Chemical oxygen demand, Population.
Identifiers: Batch systems, Lysine.

A natural microbial population was acclimated t L-Lysine as the sole carbon source when ammon nitrogen was provided in the medium. Fructose e erted a slight retarding effect upon the metabol removal of lysine. The response was due to catabo ic repression of the inducible enzyme syste responsible for lysine degradation. Inhibition of a tivity of preformed enzymes played no part in th response. Ribose caused a slight increase in the ra of synthesis of lysine-degrading enzymes. Th response of the system to carbohydrates was function of the growth rate and of the rate production and accumulation of metabolic inte mediates. The compound allowing the faste growth exhibited the most severe repression. Glu cose supported relatively rapid growth (mu su m)% (0.45/hr) with the production of many inte mediates and, consequently, had a severe effe upon production of lysine-degrading enzyme Fructose, on the other hand, allowed the cells t grow with a (mu sub m) of only 0.17/hr with th excretion of few intermediates, and its effect wa rather mild. Growth on ribose was very slow (m sub m)% (0.04/hr). The major portion of ribos utilization which did occur in the mixed substrat system may have been directed to the synthesis RNA, which would account for the increased eff ciency of the cells and allow a faster rate of synthe sis of lysine-degrading enzymes. CONTROL MECHANISMS OPERATIVE IN NATURAL MICROBIAL POPULATIO SELECTED FOR ITS ABILITY TO DEGRAD L-LYSINE, III. EFFECTS OF CAR BOHYDRATES IN CONTINUOUS-FLO SYSTEMS UNDER SHOCK LOAD CONDI TIONS,
Oklahoma State Univ., Stillwater. Bioengineerin Labs.
C. P. L. Grady, and A. F. Gaudy, Jr.
Applied Microbiology, Vol 18, No 5, p 790-79 November 1969. 5 fig, 1 tab, 11 ref.

Descriptors: *Carbohydrates, *Control, *Effects *Microbiology, Activated sludge, Bacteria, Chemi cal oxygen demand, Population.
Identifiers: *Continuous-flow, *Shock loads, L Lysine.

Two naturally selected microbial populations wer maintained under continuous-flow conditions wit glucose or magnesium growth-limiting. The reac tors were subjected to shock loads by changing th

luent substrate from L-Lysine to a mixture of L-sine and glucose, L-Lysine and fructose, or L-sine and ribose. During the subsequent transient te, the following parameters were examined: ne COD, carbohydrate COD, total COD, logical solids concentration, cell protein, enzy-tic capability (lysine-degrading enzymes), and rate of lysine removal. The carbohydrate was n removed from the influent and the same rameters were examined until a new steady state s established. In all cases, glucose and fructose used a significant repression of the synthesis of ine-degrading enzymes, resulting in a decrease in enzymatic capability of the cells. In the carbon-ited reactor, the faster the flow rate, the greater s the repression, whereas, in the magnesium-ited reactor, the slower the flow rate, the greater s the repression. The introduction of ribose into reactors caused an initial increase in lysine en-matic capability followed by a slight repression en ribose degradation started. (See also W70-336) (Aguirre-Texas)

entifiers: *Unit processes, Algorithm, Sewer harges.

he use of a dynamic programming algorithm to in-stigate the economics of cannery waste treat-ent was demonstrated. The algorithm found the inimum cost-size-efficiency relationships for moving BOD from a cannery waste and treating id disposing of the solid wastes. The items con-dered were: in-plant waste treatment, municipal aste treatment systems, and one flow of waste ater, that, leaving the cannery. The in-plant treat-ent consisted of 5 components: screening, BOD emoval from liquid wastes, ultimate liquid isposal, solid waste treatment, and disposal. leven alternative unit processes comprised com-onent II. Vacuum filtration and solids oxidation ere the alternatives for component IV. Two alter-atives were considered for solids disposal: com-osting and landfill. The predominant treatment ystem that minimized cost consisted of screening, n aerated lagoon, and, depending on the size of he plant, either landfill or composting. An exam-le problem illustrated the use of these minimum ost-size-efficiency relationships. A sewer service harge was assumed in order to evaluate the alter-atives between treating the wastes in-plant, ischarging to a municipal system, or combinations f the two. (Galwardi-Texas)

TREATMENT AND SLUDGE DISPOSAL OF WASTES FROM THE MANUFACTURE OF AC-TIVATED CARBON,
Atlas Chemical Industries, Inc., Wilmington, Del.
S. A. LaRocca, W. W. Eckenfelder, Jr., and J. F. Malina, Jr.
Proceedings, Industrial Waste Conference, 23rd, p 1147-1165, May 1968. 12 fig, 5 tab.

Descriptors: *Industrial wastes, *Activated carbon, *Waste water treatment, *Sludge treatment, *Sludge disposal, Vacuum drying, Dewatering, Neutralization cyclones, Lime, Fly ash, Iron, Texas, Pilot plant, Laboratory tests, Performance.
Identifiers: *Suspended solids, Marshall (Texas), Iron precipitation, Liquid cyclones.

The manufacture of activated carbon from lignite yields a highly acidic waste water containing suspended fly ash and activated carbon particles. Pilot plant and laboratory studies were conducted to evaluate the most feasible means of suspended solids removal and sludge dewatering and disposal. Sedimentation and thickening, liquid cyclones, neutralization, centrifugation and vacuum filtration were considered. Neutralization of the waste to a pH of 8.0 to 8.5, eliminating post-precipitation of iron, was required to produce a stable and clear effluent. Product recovery of the activated carbon particles was decided upon. A complete waste treatment flow sheet for suspended solids removal and disposal was developed. Treatment for removal of the chemical precipitate consists of neutralizing the waste to 8.0 to 8.3 with lime, thickening with polyelectrolyte and sludge dewatering by vacuum filtration. Separate removal of fly ash consists of liquid cyclones in a closed loop recirculating system and dewatering by a horizontal belt vacuum filter. (Galwardi-Texas)

THE ORIGIN AND CHARACTERISTICS OF TOXIC WASTES, WITH PARTICULAR REFERENCE TO THE METAL INDUSTRIES,
Canning (W.) and Co. Ltd. (Gt. Brit.).
W. Lowe.
Water Pollution Control, Vol 69, No 3, p 270-280, 1970. 4 fig, 6 tab.

Descriptors: *Effluents, *Industrial wastes, Industries, Metals, Toxicity, *Waste water treatment.
Identifiers: *Metal finishing industry, *Toxic wastes.

This paper provides information on the wide range of processes used in the metal finishing and allied industries which give rise to toxic effluents, and indicates the nature of those effluents. Many of the processes are used in the preparation of, and for the protection and/or decoration of, a variety of metal and non-metallic surfaces. These processes include degreasing, pickling, dipping, stripping, etching, brightening, and polishing, and the production of corrosion-resistant, wear resistant or decorative films and deposits by chemical or electrochemical means. The paper indicates the general nature and ranges of composition of mixed effluent flows from differing plating and anodizing sequences, including the usual pre-cleaning processes but excluding any effects from the disposal of strong waste processing solutions. Typical effluents from an automatic plant for copper, nickel and chromium plating of zinc-base diecastings; from nickel, copper, nickel and chromium plating of ABS type plastics; from a hard chromium plating plant; from an automatic barrel zinc and cadmium plating and passivating plant; from a mixed manually-operated barrel and rack plating plant; and from a sulfuric acid anodizing plant, including chemical bright dipping, are presented. (Aguirre-Texas)

EFFECT OF TOXIC WASTES ON TREATMENT PROCESSES AND WATERCOURSES,
Water Pollution Research Lab., Stevenage (England).
S. Jackson, and V. M. Brown.
Water Pollution Control, Vol 69, No 3, p 292-313, 1970.

Descriptors: *Biological treatment, *Water pollution, Effects, Toxicity, Wastes, Anaerobic digestion, Watercourses, *Waste water treatment.
Identifiers: *Toxic wastes.

Anaerobic digestion of sewage sludge is more sensitive than aerobic sewage treatment to inhibition by toxic substances, notably chlorinated organic compounds and heavy metals. Nitrification is the most sensitive aspect of the aerobic processes, although considerable acclimatization to inhibitors is possible. In general, biological treatment processes are able to protect watercourses from a variety of toxic organic compounds, after acclimatization at least, by degrading them; others are removed, to different extents, by volatization, adsorption or precipitation. Quite large proportions of some organic substances, and of some heavy metals, are not removed, and pass on to the receiving watercourse. The impact of toxic substances on watercourses is usually assessed in terms of their toxicity to fish. Although this is a very important criterion, it must be borne in mind that the presence of a population of fish does not guarantee the wholesomeness of a watercourse in all respects. Data are available on the toxicity of many substances to fish but they are usually limited to determinations of the LC50 in 48 to 96 hours at high concentrations of poison. There is still great uncertainty about the long-term toxic effects of much lower concentrations under natural conditions. Further investigations are in progress to provide a really satisfactory basis for defining toxic limits under natural conditions. (Aguirre-Texas)

Identifiers: Sudax forage.

It is a matter of public concern that effluents from oxidation lagoons have caused high BOD, coliform, and nutrient levels in the receiving streams. The purpose of this study was to investigate irrigation as a means of disposing of oxidation pond effluent before it reaches streams. Test plots of Sudax forage were furrow irrigated using three irrigation treatments (oxidation pond effluent, conventional irrigation and no irrigation) and two nitrogen fertilizer levels (0 and 240 lbs/acre). A total of 13.4 inches of water was applied during the June-September growing season, and rainfall was 15.9 inches. The yield response to irrigation was small because of a high ground water level in the test plot area. Yield response to nutrients contained in the oxidation pond effluent were also small. These nutrients were not sufficient to maintain a high level of crop production. No problems were encountered with odor, waterlogging of the soil, or reduction of the infiltration capacity of the soil. However, high ground water levels prevented the use of the plot area for the disposal of oxidation pond effluent during the late winter of 1969-70.

PRELIMINARY WATER AND WASTE MANAGEMENT PLAN.
Sacramento Regional Area Planning Commission, Calif.

Available from NTIS as PB-191 351, $3.00 in paper copy, $0.65 in microfiche. Report to the Sacramento Regional Area Planning Commission, November, 1969. 126 p.

Descriptors: *Waste water treatment, *Sewage systems, *Water supply, Water demand, Waste treatment.
Identifiers: Sacramento County, Yolo County, Placer County, El Dorado County, Folsom, Galt, Isleton.

A considerable amount of water and waste management planning has been done by individual entities within the Sacramento regional area during the past several years. As a result, a good base has been established for solving problems and planning for future development. The predicted future growth, a 40 percent increase in population by 1980 and 73 percent by 1990, indicates further demands will be made upon the land, water and air. At the present time there are 50 waste treatment facilities located in Sacramento County. With the increasing demands on the water resources of the region for water supply, recreation and aesthetic enjoyment, additional constraints will be placed upon waste disposal in the future. The long range waste management plan envisions maximizing waste water reclamation particularly in areas such as Woodland, Davis, Roseville and Placerville which are adjacent to agricultural areas. In northeast Sacramento County groundwater recharge with reclaimed waste water also appears possible. Consolidation of facilities in Sacramento County appears feasible and desirable to eliminate a number of the small waste treatment plants. The construction of a joint outfall for conveying treated waste water from West Sacramento to Hood appears less costly than advanced waste treatment. In areas outside of Metropolitan Sacramento, future waste treatment and disposal needs can be met for the most part by expanding existing facilities, possibly adding advanced waste treatment.

AUTOMATED ACTIVATED SLUDGE PLANTS WITH RESPIRATORY METABOLISM CONTROL,
Omnium d'Assainissement, Paris (France).
P. Brouzes.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, Sec II, Paper 5, September 1968. 12 p, 9 fig, 6 ref.

Descriptors: *Activated sludge, *Automation, *Control, *Metabolism, *Respiration, Automatic control, Control systems, Growth rates, Oxygen demand, Oxygen requirements.
Identifiers: Auto-oxidation.

Sewage treatment plants have profited little from the numerous studies and the basic theories relating to the growth of cultures of micro-organisms. The main reason is probably the difficulty in controlling instantaneously the pollution load received at these plants. As a result, the energy consumption for oxygenation is excessive and the growth rate of the culture varies uncontrolled. The pollution load and its variations can be determined with very good approximation, by treating the characteristic parameters by means of an analog computer. The energy consumption for oxygenation is reduced, since it corresponds at each moment to the actual pollution load. Control equipment varying in type from the simpler regulator to the analog computer, have been adopted for adjusting the two basic factors of air input and excess sludge removal. Excess sludge removal is achieved automatically in accordance with the desired operating conditions and the instantaneous pollution load, which the air input is adjusted so as to maintain a constant concentration of dissolved oxygen. Applying this control over the growth rate has enabled the power used to be reduced by 25% with a slight increase in the amount of BOD removal by the aeration plant. ENERGY AND HYDRAULIC TESTS ON MECHANICAL AERATION SYSTEMS,
Emschergenossenschaft, Essen (West Germany).
E. Knop, and K. H. Kalbskopf.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslavakia, April 21-25, 1969: Pergamon Press, Ltd, Sec II, Paper 11, September 1968. 14 p, 15 fig, 2 ref.

Descriptors: *Activated sludge, *Energy, *Hydraulics, *Testing, Aerating, Energy transfer, Equipment, Hydraulic properties, Hydraulic radius, Mechanical equipment, Mixing.
Identifiers: *Mechanical surface aerators.

The design and operation of mechanical surface aerators may be subdivided into three groups which may be termed cone aerators, jet aerators, and bruch aerators. The results achieved so far and the general observations made on a BSK turbine, various types of simplex cones, and a mammoth rotor by the Emscher Association are presented. In the activated sludge process, mechanical surface aerators must not only furnish the oxygen requirements for biological treatment, but they must also ensure turbulent mixing of waste water and activated sludge, preventing sludge deposits within the aeration tank by creating sufficiently high velocities. When a propeller was used in a square tank of 1200 m cubed, the power required to obtain a velocity of some 30 m/sec was 2 W/m cubed of tank contents. In treating waste water by the activated sludge process, the power required for the aeration tank is generally higher: depending on the shape and size of the tank and the applied loading, it is 5W/m cubed to 20 W/m cubed. Thus, most of the power is required for the aeration process. The required power expenditure, at the Emscher Mouth pilot plant, ranged from about 0.1 kWh/kg BOD5-removed at an influent BOD5 of 200 mg/l to 0.4 kWh/kg BOD5-removed at an influent BOD5 of 60 mg/l. The corresponding oxygen requirements ranged from 0.25 to 0.75 kg O2/kg BOD5 in influent. (See also W70-08627) (Aguirre-Texas)

FLUCTUATION OF EFFLUENT QUALITY IN ACTIVATED SLUDGE PLANTS,
Bureau of Sewage Treatment Operation Pribram (Czechoslovakia).
Ivan Spicka.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, Sec II, Paper 2, September 1968. 8 p, 3 fig, 22 ref.

Descriptors: *Activated sludge, *Effluents, *Fluctuations, *Kinetics, Biochemical oxygen demand, Chemical oxygen demand, Mathematical models.
Identifiers: Extended aeration, High-rate activated sludge, Resistance index, Sludge activity index, Volatile suspended solids.

The fluctuations of effluent quality from various modifications of activated sludge systems are described in terms of the theory of kinetics of activated sludge processes. Because metabolism of complex substances brings about a significant change in structure and composition, it is suggested that the filtrate BOD removal rate (sludge activity index) per unit weight of organisms is a function of the availability index rather than a function of substrate concentration. The suspended solids removal rate is primarily a function of sludge settling characteristics. At the present time there is no way to control the sludge settling conditions. It is predicted that the resistance index increases with decreasing sludge activity index and vice versa. The reliability of the proposed model has been borne out by large-scale experimental data. As far as effluent BOD is concerned, the unremoved hourly BOD in a 24-hour period varied for small extended aeration plants, conventional activated sludge plants and high-rate activated sludge plants within the limits of 60 to 160%, 60 to 170% and 35 to 185% of the average hourly unremoved BOD, respectively. THICKENING CHARACTERISTICS OF ACTIVATED SLUDGE,
Illinois Univ., Urbana.
Richard I. Dick.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslovakia April 21-25, 1969: London, Pergamon Press, Ltd, Sec II, Paper 18, September 1968. 15 p, 9 fig, 1 tab, 11 ref.

Descriptors: *Activated sludge, *Consolidation, Areal, Mathematical models, Rheology, Sedimentation, Settling velocity, Sludge, Yield strength.
Identifiers: *Characteristics, *Thickening.

The settling characteristics of activated sludge differ from those of the ideal suspension on which gravity thickening theories are based. The 'non-ideal' behavior of activated sludge was interpreted in terms of the rheological properties of the suspension. A conceptual model of the hypothesized mechanism of subsidence of activated sludge was developed based on an analysis of forces acting on a mass of sludge. The resulting mathematical expression was inconsistent with prevailing theories of thickening, but was in close agreement with the observed settling behavior of activated sludge. The relative magnitude of the interparticle force was shown to be related to the yield strength of the sludge. It was concluded that the reason activated sludge failed to conform to prevailing theories of thickening was that it had a yield strength at ordinary mixed liquor suspended solids concentrations. The interparticle forces cause a reduction in settling velocity which is not considered in present theories relating to the area requirement for thickeners. The area of the thickening portion of a settling basin need not be considered to be inalterably established by the settling velocity of the rate-limiting concentration of activated sludge. The area can be reduced, or the capacity of an existing basin can be increased, by minimizing the reduction in settling velocity due to interparticle forces with the sludge, by controlling the depth and mixing conditions in the settling basin. KINETIC ASPECTS OF THE TREATMENT OF PHENOLIC WASTES,
P. W. Graham.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, Sec II, Paper 8, September 1968. 15 p, 5 fig, 3 tab.

Descriptors: *Activated sludge, *Kinetics, *Phenols, *Treatment, *Wastes, Biological treatment, Efficiencies, Industrial wastes, Mathematical models, Oil industry.
Identifiers: Mass loading.

is now well known that strong phenolic wastes e amenable to biological oxidation, but the ef-tts of the concentration of the waste on the namics of the process have not received a great al of attention. Work on the kinetics of the treat-nt of such effluents derived from gas manufac-e is described. Chromatographic and other alytical procedures have been used to follow the e of oxidation of the phenolic material contained erein, and the information has been supple-nted by bacterial counts. Gas liquors were logically treated over a wide range of dilutions d retention times. The maximum flow rate that uld be applied successfully was dependent on the ution: as the dilution was increased, so the max-um flow rate could be increased. The kinetics of mple continuous culture were used to demon-ate that the concentration of ammonium loride in the liquor was responsible, in part at st, for the observed dilution effects. It was con-ded that design criteria based solely on the con-ntration or mass loading of oxidizable substrate y be inadquate, and should not be applied over a de range of concentrations, unless the inhibitory ects of other constituents are known. IOSPHORUS REMOVAL WITH FERRIC ON AND ALUMINUM,
rlsruhe Univ. (West Germany).
hannes Popel.
urth International Conference on Water Pollu-n Research, Sec III, Paper 1, September 1968. p, 4 fig, 6 tab, 10 ref.

escriptors: *Aluminum, *Iron, *Phosphorus, agulation, Costs, Efficiencies, Mathematical dels, Nutrients, Sewage treatment.
entifiers: *Phosphorus removal.

ethods for removing the nutrients in treated wage prior to discharge have been worked out d in the case of phosphorus, coagulation with fer- or aluminum salts has been proved to be a relia- process. A combination of two theories scribes the removal mechanism: (a) adsorption the phosphates on hydroxide flocs and (b) the rmation of FePO4 or AlPO4 by precipitation. ie proposed model, derived on the basis of the echanism of phosphate binding with the respec-e coagulant metal ions, is applicable to generaliz-g and forecasting removal efficiencies in the nge of 45 to 95%. The model is also applicable to wage containing polyphosphates when relating e relative amount of coagulant to moles to total osphorus P. Compared to the relative amount of agulant, the influence of the initial phosphorus ncentration on the removal efficiency will be sig-ficant only when the initial P varies over a wide nge. Subsequent coagulation produces a better fluent quality and more consistant removal sults than simultaneous coagulation. Ferric loride is slightly less efficient than aluminum lfate on the basis of moles of coagulant ion ap-ied per mole of phosphorus, while the coagula-on product of ferric chloride is generally better ttleable than that of aluminum sulfate. A relative osphorus removal exceeding 90 to 95% is onomically not justified. For removal efficiencies the above magnitude the costs for coagulants ill vary depending upon the coagulant and the sponse of the sewage towards the coagulation ocess from approximately 3-10 DM/cap. year nder German conditions. ICROBIOLOGY OF A WASTE STABILIZA-ION POND,
entral Public Health Engineering Research Inst., agpur (India).
. V. Bopandikar.
: Advances in Water Pollution Research, roceedings Fourth International Conference on Vater Pollution Research, held in Czechoslovakia, pril 21-25, 1969: London, Pergamon Press, Ltd, ec II, Paper 16, September 1968. 7 p, 32 ref.

Descriptors: *Biological treatment, *Microbiology, *Oxidation lagoons, Bacteria, Efficiencies, Lagoons, Microorganisms, Organic Loading, Pathogenic bacteria, Ponds, Viruses.
Identifiers: *Bacterial removal, Viral removal.

Stabilization ponds developed by the author in India successfully treat sewage with an average BOD of 300 mg/l to 10 mg/l at a cost of only Rs. 40,000/MGD as against Rs. 1,000,000/MGD with conventional treatment. No work, however, has been done in India on the reduction of pathogens by pond stabilization treatment. Many variables affect the types and quantities of enteric viruses that occur in sewage and the limitations of available techniques for their detection further complicate attempts to judge their significance. A review of the techniques developed for sampling and concentration of viruses from large volumes of water is presented. Methods employed for collecting sewage samples for quantitative determination of viruses include: (1) the gauge pad or swab method, (2) resin adsorption method, and (3) ultra-centrifugation. It is shown that conventional secondary treatment (including chlorination) is not effective in removing virus contamination. However, marked reduction in the yield of viruses occurred during passages through oxidation ponds. Reduction in coliforms of fecal E. coli and fecal streptococci during 30 days passage through oxidation ponds ranged between 96.0 and 99.9%. (See also W70-08627) (Aguirre-Texas)

INVESTIGATION ON THE CONTROL OF FILAMENTOUS BULKING,
Instituut voor Gezondheidstechniek TNO, Delft (Netherlands).
A. Pasveer.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, Sec II, Paper 14, September 1968. 7 p, 4 tab, 15 ref.

Descriptors: *Activated sludge, *Control, Bacteria, Biological treatment, Waste water treatment.
Identifiers: *Bulking, *Filamentous, *Escherichia coli.

An effort was made to gain further understanding of the phenomenon of bulking by isolating the causative organism and studying its properties. These properties will undoubtedly be influenced by the conditions in the activated sludge floc. Therefore, the conditions in the floc and at the floc boundary were also studied. Two years of investigation of an oxidation ditch with bulking sludge resulted in the conclusion that oxygen supply, growth of filamentous organisms, nitrification and denitrification were in some way connected. The causitive organism was found to be Escherichia coli, which shows filamentous growth at pH 5 to 6. Microscopically, the filamentous growth of E. coli is singularly like that of Sphaerotilus. High loads (of carbohydrates) together with a nitrifying flora prevailing in the activated sludge may lead to conditions in which E. coli can thrive in the floc in filamentous form. It is not claimed that every case of filamentous sludge must necessarily be a coli infected sludge. It is believed nevertheless that this type may be rather common, in light of the explanation given and the results of other investigators. (See also W70-08627) (Aguirre-Texas)

COMPARISON OF AERATION EFFICIENCY UNDER PROCESS CONDITIONS,
Rolf Kayser.
In: Advances in Water Pollution Research, Proceedings Fourth International Conference on Water Pollution Research, held in Prague, Czechoslovakia, April 21-25, 1969: London, Pergamon Press, Ltd, Sec II, Paper 10, September 1968. 10 p, 5 fig, 1 tab, 6 ref.

Descriptors: *Activated sludge, *Aeration, *Efficiencies, Biological treatment, Oxygenation, Oxygen requirements.
Identifiers: *Process conditions.

Oxygenation capacity is generally determined in tap water and also, in order to approach process conditions more closely, in biologically purified sewage and tap water with detergents. To do these tests it is either necessary to take the aeration tank out of operation or to construct special test plants. The aim of this work was to work out methods and techniques for determining oxygenation capacity and aeration efficiency under process conditions. Under process conditions the oxygenation capacity and thus also the aeration efficiency can be measured in non-steady state or in steady state experiments. Both methods give the same results. Errors occur less easily if measurements are made in non-steady state experiments, when the overall transfer coefficient can be determined independently of calibration errors of the oxygen electrode. The only measurements necessary for the determination of the oxygenation capacity are: (1) oxygen content in the aeration tank, and (2) respiration rate of the activated sludge. Both values can be measured easily using a membrane covered oxygen electrode. An experimental evaluation with activated sludge revealed a constant oxygen content of 8.1 mg/l and a respiration rate of 11.7 mg/l-hr in a non-steady state experiment. DEGRADATION OF WASTE WATER ORGANICS IN SOIL,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
Richard E. Thomas, and Thomas W. Bendixen.
Journal of the Water Pollution Control Federation, Vol 41, No 5, p 808-813, May 1969. 3 tab, 17 ref.

Descriptors: *Soils, *Sludge disposal, *Digestion, *Soil disposal, Yields, Sludge treatment, Costs, Soil microorganisms, Fertility, Fertilizers, Organic wastes, Waste water.
Identifiers: *Loadings.

Land disposal of liquid sludge is economically competitive with other disposal and can have the added attractiveness of being beneficial to the land. The use of land disposal for liquid sludge reduce sludge disposal costs to about $10/ton of dry solids. The results of a series of lysimeter studies show that microorganisms can digest much of the organic carbon contained in primary and secondary waste water effluent. About 80% of organic carbon from septic tank effluent was digested under a wide variety of conditions. Large variations in temperature, loading rate and duration of dosing had no effect on the percentage of organic carbon which was degraded. Organic carbon application rates up to 31 tons/year/acre resulted in soil residues of less than 3 tons/year/acre. Based on typical values for the composition of sludge this would be equal to 100 tons/year/acre of dried digested sludge solids. (Hancuff-Texas)

5F. Water Treatment and Quality Alteration

CONTINUOUS COUNTERCURRENT ION EXCHANGE.

Ind Water Eng, Vol 7, No 2, p 18-38, Feb 1970. 21 p, 12 fig, 8 ref.

Descriptors: *Ion exchange, Chemistry, Chemical engineering, *Capital costs, Distillation, *Demineralization, Chromatography, Water softening, Absorption, Economics Brines, Industrial plants, Fluids, *Resins, Flow rates, Technology, *Water treatment, Apparatus, Waste water treatment, Boiler feed water.
Identifiers: Demineralizers, Exchange capacity.

Unitl the present decade, the development of ion-exchange technology has been based on improvements in the chemistry of the process, with new resins creating new possibilities. A change has taken place, however, with new engineering techniques the dominating factor in development. The Asahi process is very successful, as attested by the many plants built to this design and operating, not only in Japan where the process was developed originally, but also in the U S, Britain, and France. Success of the Asahi process is the result of the essential simplicity. Over 70 continuous countercurrent ion-exchange plants have been designed by Chem-Seps and installed for demineralizing, dealkalizing, and softening water. This process is not dissimilar in principle from the Asahi process, the plant consisting of a closed cycle of adsorption and regeneration vessels in which the resin remains static for a service cycle, interrupted by short periods for resin movement. The difference in technique is essentially one of hydraulics. The continuous system of Paterson Candy is based on a fluidized bed contractor, differing in several respects from an intermittently moved packed bed. (USBR)

RADIOTRACER STUDIES ON RAPID SAND FILTRATION,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
T. F. Craft, and Geoffrey G. Eichholz.
Available from NTIS as PB-193 681, $3.00 in paper copy, $0.65 in microfiche. Engineering Experiment Station, Georgia Institute of Technology, EES Project E-600-705, June 1970. 59 p. OWRR Project B-020-GA (2).

Descriptors: *Rapid sand filters, *Porous media filter, *Radioactive tracers, *Water treatment, *Filtering system, Cesium-137, Filter sands, Radioisotopes, Adsorption, Particle shape, Particle size, Pores, Porosity, Colloids, Flocculation.

The research was designed to provide information on the basic mechanism involved in the action of porous media filters and provide information for improvement of water filter design. Both the theoretical and practical aspects of rapid sand filtration were investigated. Radiotracer techniques were used to measure accumulations of suspended matter in porous filter beds. Filter coefficients were calculated and were used in determining the mechanisms involved when suspended particles are trapped by a porous medium, such as sand or anthracite. Experimental evidence shows that three major actions occur--physical hindrance, interstitial sieving, and the physico-chemical van der Waals and double layer forces. The particular mechanism by which a given particle is trapped in a porous medium is determined primarily by the size of the particle. There is a gradual transition between applicable mechanisms, but the relative effectiveness depends on the particle size. The effectiveness of anthracite and normally graded, reverse graded and uniform sand was evaluated in a series of long filter runs. From the standpoint of head loss, anthracite plus sand or anthracite alone is superior. Other media in order of decreasing effectiveness are reverse graded sand, uniform sand, and normally graded sand. When all factors are considered, anthracite plus sand was found to be the best choice for filter media. The report contains 22 illustrations and 9 references. (Conway-Georgia Tech)

WATER QUALITY PLANNING AND MANAGEMENT (PLANNING ESSENTIAL TO INSURE WATER QUALITY),
California State Water Resources Control Board, Sacramento.
Philip N. Storrs, and Jerome B. Gilbert.
American Water Works Assn. Journal, Vol 62, No 3, Mar 1970, p 141-144.

Descriptors: *Water resources development, *Water quality, *Management, *Planning, Water users, Damages, Maintenance, Water quality control, Water requirements, Water demand, Water management (Applied), Water policy, Water shortage, Water supply, Water utilization, Public health, Standards, Administration, Social aspects, Long-term planning, Future planning (Projected), Coordination, Governments, Programs.

In the past, water resources development has been based on expediency, as water quantity was the primary concern of water users. However, the importance of water quality in water resources development is now being recognized. Moreover, in order to avoid irreparable damage to our water resources, rational and comprehensive water resources planning and management must be utilized. In planning for the maximum use of water resources which are consistent with their maintenance and protection, consideration should be given to the interrelationship between water development and usage and water quality because changes in one aspect of a water resources system may have far-reaching consequences in other areas of water use. Therefore, there is a need for a comprehensive water planning program which would be based on a defined water system and which would consider the relationships of all water uses in such system. Furthermore, it is imperative that the planning agency develop broadly based programs in such a manner as to coordinate planning at all levels of government. This overall planning is essential in order to insure an adequate supply of quality water for the future. (Finman-Florida)

APPLICATION OF SPECIALIZED OPTIMIZATION TECHNIQUES FOR WATER QUALITY AND QUANTITY MANAGEMENT WITH RESPECT TO PLANNING FOR THE TRINITY RIVER BASIN,
Texas A and M Univ., College Station. Water Resources Inst.
W. L. Meier, Jr., and C. S. Shih.
Available from NTIS as PB-193 684, $3.00 in paper copy, $0.65 in microfiche. Water Resources Institute, Technical Report 30, July 1970. 115 p, 11 tab, 20 fig, 40 ref. OWRR Project B-024-TEX (1).

Descriptors: *Optimization, Water resources planning, Water quality, Management, Dynamic programming, Operations research, *Systems analysis, *Waste water treatment, *Water treatment, *Low flow augmentation, Texas.
Identifiers: Planning, Optimization, Management, Water quality, Systems analysis, Trinity River (Texas).

Techniques are developed and presented forming the basis for the development of water management plans which include consideration of water quality and quantity in the same model. The methodology described in this report utilizes a dynamic programming approach in devising the mix of waste treatment, water treatment, and low flow augmentation to minimize the total cost of developing and operating the system while being regulatory in aesthetic restrictions. Use of these procedures permits the evaluating of the trade-off between costs for water and waste treatment and reservoir releases for quality control plus a consideration of the economic returns afforded b recreational use of the water. This investigatio represents more of a systems approach to wat quality management than the studies heretofo completed. Advances in the optimization of no serial multistage systems are presented in the r port along with a discussion of the computation solution of such systems. Example problems are i cluded illustrating the use of the techniques. (Me er-Texas A and M)

A CONTRIBUTION TOWARDS THE REDUC TION OF ICE FOG CAUSED BY HUMI STACK GASES AT ALASKAN POWER STA TIONS,
Glasgow Univ. (Scotland); and Dartmouth Coll Hanover, N.H.
Andrew Porteous, and Graham B. Wallis.
Atmospheric Environment, Vol. 4, p 21-33, 197 10 fig, 10 ref.

Descriptors: *Fog, *Ice, *Humidity, Gases, The mal powerplants, Drying, Moisture uptake, Alask Design data, Ducts, Velocity, Drops (Fluids).
Identifiers: *Ice fog, *Visibility problem.

The humid power station gases at U. S. Army an Air Force Bases in Alaska can cause considerabl ice fog visibility problems. The evaluation of var ous alternatives for drying the humid stack gase shows counter-current scrubbing to be a viabl solution where plentiful water supplies exist. Hig moisture removal rates can be easily accomplishe as shown by the experimental results. The goo agreement between theory and experiment enable spray towers to be designed to cope with the dehu midification of stack gases. The complete scrubber for the conditions at a typical air base then designed for a gas velocity of 2.1/m.sec, wit an active contact height of 10 m, to handle a we total of 246,000/kghr of flue gases. Consideratio is given for optimum droplet size to accomplis both grit and moisture removal from the gases. (H sieh-Vanderbilt)

THE OPTIMIZATION OF STORM-HOLDIN TANKS: A PROBLEM OF WATER POLLUTIO CONTROL,
Stanford Univ., Calif.
Charles Albert Kohlhaas.
Available from University Microfilms, Ann Arbo Michigan, $15.30 per copy or $4.35 on microfilm Ph.D. Dissertation, February, 1970. 321 p.

Descriptors: *Optimization, *Storm drain *Economics, Soical aspects, Recreation, Mathe matical models, Chlorination, Settling tanks, Infi tration, Computer programs.
Identifiers: *Storm sewage, *Combined sewer *Storage tanks, Non-linear programming, Effluen tax, San Francisco Bay.

A literature review of the hydrology, quality, effec on the environment, and control technology o combined sewer overflows and overflows fro sewers subject to heavy infiltration is made. A analysis of water pollution externalities an remedies for dealing with them, including the us of the effluent tax in particular, is given. The rela tionship between the pollution caused by storm sewage overflow and competing urban needs is in vestigated. Two mathematical programs for op timizing control facilities form storm-sewage over flows are defined - one achieves economic efficien cy by means of the effluent tax, the other incor porates water quality goals by means of strean standards. The stream standards program is applie to a practical problem of storm-sewage overflow i

East San Francisco Bay, California. Water quality regulations for controlling overflows are formulated and treatment processes based on the use of holding tanks are defined. The effect of a holding tank on input discharge, BOD, and coliform concentrations is described. Graphs relating BOD load and average coliform concentration of holding tank effluent to tank capacity are employed to size holding tanks capable of meeting effluent standards. The mathematical program is solved as a separable non-linear program. Detention times needed to satisfy BOD limitations were more than adequate to meet limitations on coliform concentrations. For most cities the high cost of solutions to storm-sewage overflow problems will prevent the implementation of control measures in the near future. An effluent tax may be used as a means of financing alternative recreation and as an incentive for implementation of control measures. Requirements concerning maximum coliform concentrations are best met by limitations on the minimum size of holding tanks. Optimization models capable of incorporating an almost infinite number of holding tanks and over 2,000 water quality requirements may be constructed. (Kohlhaas-Stanford)

OPTIMAL RESOURCE ALLOCATION AND SOME TECHNIQUES OF OPTIMIZATION,
Purdue Univ., Lafayette, Ind.
Edna T. Loehman.
Purdue University Doctor of Philosophy Thesis, Purdue Library, August, 1970. 186 pages, 18 fig, 2 tab, 4 ref. OWRR Project B-020-IND (2).

Descriptors: Mathematical models, *Resource allocation, Resource Development, *Optimization, *Water pollution, Treatment facilities, Waste disposal.
Identifiers: Second best behavioral model, Algorithms, Zero-one programming.

This thesis is a collection of papers dealing with optimal allocation of water resources. The first paper discusses the problem of the Second Best. What is meant by 'second best' is made clear by using as examples two cases of market imperfection: monopoly and an externality due to water pollution. The second paper extends the modeling of a water pollution externality to a time-varying case. It is shown that restrictions on the polluter for optimal resource allocation should vary with streamflow. The third paper presents algorithms and a computer program for zero-one integer programming. The algorithms are tree search methods where the search is guided by an associated linear programming problem. The last section of the thesis is a proposal for further work in the area of treatment plant financing and design. A bargaining model is proposed to determine location and capacity of a treatment facility given that bargaining participants have rights to use a certain proportion of the facility and must pay a certain proportion of fixed costs as well as price per unit of treatment.

SOME EFFECTS OF FRESH-WATER INFLOW ON THE FLUSHING OF SOUTH SAN FRANCISCO BAY: A PRELIMINARY REPORT,
Geological Survey, Washington, D.C.
D. S. McCulloch, D. H. Peterson, P. R. Carlson, and T. J. Conomos.
Available free on application to the U S Geological Survey, Washington, DC 20242. In: A Preliminary Study of the Effects of Water Circulation in the San Francisco Bay Estuary, U S Geological Survey Circular 637-A, p A1-A27, 1970. 27 p, 15 fig, append.

Descriptors: *Estuaries, *Water circulation, *Bays, *California, *Water quality, Nutrients, Sewage disposal, Water pollution sources, Path of pollutants, Water pollution control, Tides, Currents (Water), Discharge (Water).
Identifiers: *San Francisco Bay.

Data are provided for those interested in optimum development of the San Francisco Bay estuary. A clear understanding of this estuary system is necessary for evaluating such things as the ability of the estuary to assimilate agricultural, municipal, and industrial waste products; the relation between the amount of freshwater inflow and the quality of the bay water; and the movement of water masses and entrained material within the estuary. The seasonal salinity variation of the south bay is largely controlled by fresh water from the Sacramento River under present conditions and is nearly unaffected by the comparatively minor discharge of south bay streams and sewage. The change in phosphate concentration corresponds with the seasonal change in the Sacramento River discharge. Apparently changes in net flow of fresh water to the bay from this source is an important controlling factor in flushing of the south bay. Soluble waste materials are removed from south bay largely during periods of high river discharge. (Knapp-USGS)

ENVIRONMENTAL QUALITY.
Council on Environmental Quality, Washington, D.C.

Report available for inspection in USGS-WRD Library, Wash, D C. For sale by Superintendent of Documents, U S Government Printing Office, Wash, D C 20402 - Price $1.75 (paper copy). First Annual Report of the Council on Environmental Quality together with President's Message, transmitted to Congress August 1970. 326 p, 10 fig, 10 tab, 12 append.

Descriptors: *Environmental sanitation, *Water policy, *Governments, Waste disposal, Land use, Air pollution, Water pollution, Pesticides, Solid wastes, Population, Political aspects, Water resources development, Ecotypes, Waste treatment, Water quality control, Cost analysis.
Identifiers: *Environmental quality, *Ecological problems.

A comprehensive and useful statement is given of the principal environmental issues that confront the nation - water pollution, air pollution, inadvertent modification of weather and climate, disposal of solid wastes, problems of land use, pesticides, and radiation. Prepared by the Presidents's Council on Environmental Quality and transmitted to the Congress August 10, 1970, the report describes the problems and issues which need to be attacked, but offers no overall solutions. Pressures on the environment are discussed in a chapter on population, economic growth, and resources. An important proposal is made for a national land use policy. In water pollution, the report urges an increase in funds for waste treatment; a program in one river basin to demonstrate concepts of water quality management; effective enforcement of water quality standards; a strong Federal policy to control thermal pollution; development of a policy for ocean disposal of wastes; creation of new methods to prevent, control and clean up oil spills; and intensified attacks on agricultural pollution. Costs to clean up the nation's water over the next 10 years will total $10 billion. (Lang-USGS)

THOMPSON V CITY OF PHILADELPHIA (DAMAGE CAUSED BY CITY MAINTAINED SEWAGE SYSTEM).

177 So 39-40 (Miss 1937).

Descriptors: *Mississippi, *Drainage systems, *Sewage disposal, *Compensation, *Eminent domain, Damages, Drainage programs, Drainage, Overflow, Judicial decisions, Legal aspects, Sewage, Local governments, Natural streams, Public benefits, Riparian land, Riparian rights, Drainage effects, Drainage water, Water pollution sources, Watercourses (Legal).

Defendant city maintained a sewage system, part of which included a natural watercourse flowing through plaintiff's property. Plaintiff contended that such drainage through his land caused offensive odors, rendered the water unusable and caused the watercourse to overflow from time to time, thereby resulting in a reduction in the value of his property. Defendant contended that absent proof of negligent construction and maintenance of said system, it could not be held liable to plaintiff in damages. The court held that defendant was liable for any special and different damage suffered by plaintiff not common to the general public if caused by the construction and maintenance of the system, whether properly constructed and maintained or not. Such liability was not dependent on negligence, but on the taking or damaging of private property. The judgment for defendant was reversed. (Price-Florida)

WATER QUALITY: A CONCERN FOR AGRICULTURAL ENGINEERS,
Cooperative State Research Service, Washington, D.C.
Paul E. Schleusener.
Agricultural Engineering, Vol 51, No 6, June 1970. 359 p.

Descriptors: *Water management (Applied), Water quality control, Waste water treatment, Sewage effluents.

Identifiers: *New York State Health Department, Long Island.

The challenge facing agricultural engineers in the field of water management is to devise alternative methods of maintaining water quality within the agriculture industry before effluent charges are enacted for different phases of the production and processing operations. The author cites an example of Long Island duck growers who banded together to install waste treatment systems with the cooperation of the New York State Health Department. Although the duck growers financed the waste treatment facilities with their own funds, the government regulatory agency coordinated the operation to insure that they met state and national water quality standards. OPTIMIZATION OF WATER RESOURCES SYSTEMS BY THE GRADIENT PROJECTION AND THE CONJUGATE GRADIENT METHODS,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. S. Lee, and S. Waziruddin.
Available from NTIS as PB-193 682, $3.00 in paper copy, $0.65 in microfiche. Completion Report, (1970). 102 p, 12 tab, 24 fig, 24 ref, 2 append. OWRR Project C-1032 (Number 1962) (1).

Descriptors: *Modeling, *Optimal management, *Water resources, *Gradient projection method, *Conjugate gradient method, Dynamic programming.

The gradient projection and the cojugate gradient methods are applied to the optimization of complex water resources systems. The most important advantages of these approaches are that they can be used to solve nonlinear problems with a large number of inequality constraints. Furthermore, these techniques can handle water resources systems with complex topological structures such as nonserial or branching reservoirs. Four water resources models with different complexity are solved by these methods. The results show that the convergence rate is quite fast and only a small amount of computer time and computer memory are needed to solve a fairly complex problem. These requirements on the computer time and computer memory are almost negligible compared to that required by the dynamic programming approach. (Lee-Kansas State)

A MODEL OF WATER QUALITY MANAGEMENT UNDER UNCERTAINTY,
Chicago Univ., Ill.
Charles Upton.
Water Resources Research, Vol 6, No 3, p 690-699, June 1970. 10 p, 12 ref.

Descriptors: *Water pollution control, *Water management (Applied), *Streamflow forecasting, *Stochastic processes, Probability, Standards, Water quality, Waste water treatment, Model studies, Statistical models, Mathematical models, Systems analysis.
Identifiers: *Water quality management.

Although the problems of water quality management are usually analyzed in the context of nonstochastic models, such an analysis may be misleading because of the substantial stochastic elements in streamflow. The effects of variance in streamflow are considered in this paper. The analysis shows that the problems of uncertainty may be dealt with by selecting a critical value of streamflow and then by treating pollutants sufficiently so that if streamflow falls above (or below) that critical value the water quality standard will (or will not) be met. The greater the variance in streamflow, the lower the optimal critical value. Further, the level of treatment of pollutants is higher under uncertainty than it would be if there were no variance in streamflow. (Knapp-USGS)

TIME BIAS IN RECREATION BENEFIT ESTIMATES,
Battelle Memorial Inst., Columbus, Ohio, and George Washington Univ., Washington, D.C. Natural Resources Policy Center.
Frank J. Cesario, and Jack L. Knetsch.
Water Resources Research, Vol 6, No 3, p 700-704, June 1970. 5 p, 3 fig, 7 ref.

Descriptors: *Cost-benefit analysis, *Recreation, *Demand, *Water management (Applied), Economics, Economic justification, Decision making, Planning, Costs, Feasibility studies, Resource allocation, Water demand, Estimating.
Identifiers: Recreation demand.

Indirect methods are generally necessary to measure outdoor recreation benefits. A widely proposed technique involves estimating demand schedules using travel cost data as a proxy for prices. A major problem involved with this method as it has been applied is a serious conservative bias in the estimates, owing to the improper accounting of the constraint imposed by time costs on recreational visits. The bias is examined and corrections are suggested that could improve the estimates. The degree of ultimate improvement seems to depend on better data and on an understanding of the trade-off function between time and cost outlays for this form of travel. (Knapp-USGS)

STOCHASTIC MODELS IN HYDROLOGY,
Illinois Univ., Urbana.
Adrian E. Scheidegger.
Water Resources Research, Vol 6, No 3, p 750-755, June 1970. 6 p, 13 ref.

Descriptors: *Stochastic processes, *Statistical models, Probability, Mathematical models, Model studies, Mathematical studies, Statistics, Markov processes, Time series analysis.
Identifiers: Stochastic models.

The stochastic models that can be used to represent growth and steady state phenomena in hydrology are reviewed. There are essentially two types of growth models possible; the cyclic growth model and the random configuration model. For steady state phenomena (time series) we are genera restricted to a Gaussian type of model with without autocorrelation. Self-similarity mod (fractional Brownian motion) lead to physically surd conditions if they are extrapolated to hi frequencies. (Knapp-USGS)

HYDROLOGICAL SERIES AS A BASIS FO WATER RESOURCES POLICY,
Technische Hochschule, Munich (West Germany)
W. Bechteler.
Bulletin International Association of Scientifi Hydrology, Vol 15, No 2, p 7-10, June 1970. 4 p, fig, 5 ref.

Descriptors: *Statistical methods, *Time serie analysis, Data collections, Hydrologic data Frequency analysis, Streamflow forecasting, Wate policy, Water management (Applied), Wate resources development.
Identifiers: Hydrologic series.

A necessary basis for resolving many problems con cerning water resources policy and hydrology is th

use of long, homogeneous records of stages and discharges. Although in many countries long records of water stages are available, unfortunately many series are of no use, due to mistakes, gaps, or inhomogeneities. Stage series may often show trends caused by changes of the elevation or character of the river-bed. Therefore it is absolutely necessary to test the homogeneity of each series before it is used for any further investigations. A test of homogeneity, in most cases, is only possible with the help of statistical methods. (Knapp-USGS)

Identifiers: Electric utilities, *Site selection, Electric power surveys, Pollution control, Air pollution control, Underground cables.

The importance of environment in our country has resulted in delaying electric power construction, and some areas face a possible electric energy crisis. The impact of providing the needed electricity without unduly affecting the environment is a challenge. Governmental agencies and the public utilities, privately and publicly owned, must work cooperatively toward the necessary solution. The more important aspects concerning California's need for additional power generation are discussed. Growth rates for the next 20 yr. public concern on siting, environmental and aesthetic considerations, and underground distribution are reviewed. The challenge of the 1970's to the electric utilities and manufacturers and to the regulatory agencies will be their ability to meet the requirements of the public for an improved environment, including abundant, safe, and reliable electric service at reasonable costs. PLANNING OUR FUTURE WATER RESOURCES,
Water Resources Board, Reading (England).
L. E. Taylor.
Chemistry and Industry, No. 21, May 23, 1970, p668-673, 1 tab, 3 ref.

Descriptors: *Water resources development, *Future planning (Projected), *Decision making, *Optimum development plans, Water demand, Feasibility studies, Water costs, Water storage, Reservoir storage, Groundwater, Groundwater recharge, Desalination, Electrodialysis, Environmental effects, Recreation demand.
Identifiers: *England and Wales, Estuarial barrages.

The British national problem in water resources is storage and distribution, as sufficient rain falls on the island to meet all likely needs for many years to come. It was estimated that 3000 MGD of new resources must be made available by 2001. For this purpose, the following proposals were discussed: (1) Major groundwater developments in the south east of the country. An important factor is the extent to which recirculation takes place between the river and the aquifer. (2) Artificial recharge of aquifers. The Water Resources Board is investigating the possibility of augmenting the natural infiltration to the Bunter Sandstone by means of artificial recharge. (3) Estuarial barrages. Experts are now studying the ecological and biological implications of the use of Morecambe Bay to conserve water. (4) Trent research program. This program was to determine the various ways in which the river might be made suitable for supply purposes and to assess their economic viability. (5) Desalination. The cost is about 6 s/1000 gal, which is too expensive compared to about 2 s/1000 gal for freshwater sources. (Hsieh-Vanderbilt)

SOIL, WATER AND SUBURBIA.
Department of Agriculture, Washington, D.C.; and Department of Housing and Urban Development, Washington, D.C.

Report of the proceedings of the National Conference on Soil, Water and Suburbia, Superintendent of Documents, U. S. Government Printing Office, Washington, D.C., March 1968. 160 p, 106 fig, 67 ref.

Descriptors: *Urbanization, *Soil-water-plant relationships, *City planning, *Land development, *Soil engineering, *Multiple purpose projects, *Soil stabilization, *Land use, *Administration, *Watershed management, *Soil conservation, *Soil management, Economics, Land reclamation, Federal project policy.
Identifiers: *Water-soil management, *Land use policies, Suburban land, Multidisciplinary planning.

Papers by 27 authorities in various professions, presented at the National Conference on Soil, Water and Suburbia in Washington, D.C. on June 15-16, 1967, are included in this publication. Comments by prominent discussants are also included. The purpose of the conference was to: (1) examine soil and water problems and opportunities that occur as land shifts from rural to suburban and urban uses; (2) exchange information on sources and types of soil and water management assistance available to public officials, planners, developers and builders; (3) explore the economics of land use changes, devices for reserving land for recreation, methods for maintaining natural beauty and reducing land damage and water pollution in the urban development process, and research needs in these fields; and (4) discuss opportunities for community action in local and regional planning, in improvement of existing public programs, and in establishing guidelines for future federal and state assistance. The broad subject areas covered included: Land in Transition; The Suburban Land Resource and Its Use; Knowledge in Transition; and Community Action. The papers discussed interrelationships between soil, water and people from the standpoints of problem definition and the need and advantages of bringing peiple of various professions and responsibilities together to promote effective problem solving. Multidisciplinary approaches in planning, design, development and construction are emphasized. (Poertner)

THE IMPORTANCE OF WATER RELATED ACTIVITIES AT STATE PARKS IN MISSISSIPPI,
Mississippi State Univ., State College. Water Resources Research Inst.
D. C. Williams, Jr., and Donnie L. Daniel.
Available from NTIS as PB-193 686, $3.00 in paper copy, $0.65 in microfiche. Water Resources Research Institute, State College, Mississippi, July, 1970. 70 p. OWRR Project A-033-MISS (1).

Descriptors: *Recreation, *Parks, Recreation facilities, Recreation demand, Mississippi, *Tourism.
Identifiers: State parks, Recreation visitation, *Park management.

The State parks in Mississippi are developed around and oriented to the use of water and related resources. There is a need for information on the number of visitors to the parks and the relative importance of the different water related resources for park management and planning purposes. Total visitation at the parks was obtained by use of mechanical traffic counters. During the course of one year, over 112,000 visitors were interviewed to determine the nature of their activities at the parks. The data were analyzed to determine the relative importance of water related and major non-water related activities for the Park System as a whole and by park. The activeness of visitors in the different parks was also analyzed.

EVALUATION PROCESSES IN WATER RESOURCES PLANNING.
American Water Resources Association, Urbana, Ill.

Publication sponsored by Office of Water Resources Research. Report of a research conference at Milwaukee, Wisconsin, June 16-20, 1970, William Whipple, Jr., Ernest A. Englebert, and Warren L. Trock, Editors, sponsored jointly by AWRA and University of Wisconsin, Milwaukee; 160 p, July 1970.

Descriptors: *Evaluation, *Environment, *Economic efficiency, Benefits, Economics, Ecology, Costs, Economic justification, Urbanization, Decision making, Institutions, Natural resources, Flood plain insurance, Social aspects.
Identifiers: *Effects, *Environmental quality, *Multiple objective planning, Metropolitan area water resources, Urban water problems, Economics of water quality control.

This is the report of an interdisciplinary research conference on evaluation processes in water resource planning. Due to the interests of those participating, the major emphasis was on the subject of multiple objective planning, which is about to be incorporated into Federal approaches by the Water Resources Council. Although the consensus of those present clearly approved of the main thrust of the new proposals, there were many conflicting views expressed both as to the basic significance of the change and as to how it might be implemented. The basic concept of the conference precluded formal papers or attribution of individual views; but the principal viewpoints are summarized in the conference report. Besides multiple objective

planning, other subjects of major interest included the economics of water quality control, flood plain management and flood insurance, special problems of metropolitan water resources analysis, political and economic aspects, and environmental and aesthetic aspects of evaluation processes. CHAPTER 1: INTRODUCTION.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

In: Institutions for Effective Management of the Environment, Washington, D.C. National Academy of Sciences - National Academy of Engineering, January 1970. p 13-16.

Descriptors: *Environment, *Management, Administration, Planning, Monitoring, Education, Communication.
Identifiers: Early warning system, Quick-reaction field function, Quick-reaction analytic function.

A number of functions that must be accommodated if the United States is to have effective environmental management are outlined. They include: (1) Long Range Planning: Development of a long-range strategy for effective management, protection, and use of the environment; (2) Early Warning: It is necessary to develop a system by which possible environmental disasters as well as positive developments for the improvement of environmental quality can be predicted; (3) Monitoring: To understand how man is changing his environment, ways of measuring environmental quality need to be developed; (4) Quick-Reaction Field Function: There is a need to obtain critical data in environmental problem areas on a short-term scale; (5) Quick-Reaction Analytical Function: There is a need to bring together available information in a cogent and timely fashion for decision makers at various levels of government; (6) Education: There is a need for greater numbers of personnel professionally trained in environmental problems and public awareness and concern for the environment; and (7) Communication: Closely coupled to the educational function is the function of making information about the environment available to the public. COMPREHENSIVE WATER SUPPLY, SEWERAGE, SOLID WASTE AND AIR POLLUTION CONTROL PLANS,
Palm Beach County Area Planning Board, West Palm Beach, Fla.
David B. Smith, William R. Sabis, and David H. Scott.
Available from NTIS as PB-191 553, $3.00 in paper copy, $0.65 in microfiche. Palm Beach County Area Planning Board, Engineers Project No 6914 Report, Feb 70. 148 p.

Descriptors: *Water supply, *Waste treatment, *Sewage systems, Solid wastes, *Water demand, Community development.
Identifiers: Palm Beach County, Florida.

Part One of this study, which included an inventory of Palm Beach County's water resources, water supply systems, sewerage systems, solid wastes systems, and air pollution control systems, and the legal and administrative aspects of each, was completed and published in six volumes, in 1969. The present report (Part Two) gives, under one cover, a summary of the Part One information. The report also presents an analysis of the inventory results leading into the development of comprehensive plans.

BAY ISLAND DRAINAGE AND LEVEE DIST NO 1 V NUSSBAUM (OPERATION COSTS OF PUMPING FACILITY).

388 Ill 131, 56 NE2d 615-617 (1944).

Descriptors: *Illinois, *Drainage districts, *Pumping, *Administrative agencies, State governments, Costs, Drainage, Surface drainage, Drainage programs, Drainage systems, Pumping plants, Seepage, Surface waters, Controlled drainage, Legislation, Legal aspects, Judicial decisions, Mississippi River, Federal government, Structures, Pumps.

Plaintiff drainage district brought suit against the commissioners of a sub-district for the determination of the amount owed by defendants for its share of operating a pumping plant. Plaintiff contended that under Illinois statutes, costs of such operations were to be shared by adjoining drainage districts on a percentage basis determined by the amount of water each had pumped through the plant. Defendant argued that the federal government, under a plan designed to subsidize adjoining drainage districts with seepage problems, had paid a portion of the amount claimed by plaintiff. Defendant further contended that the percentage figure assigned by plaintiff was too high. Testimony was introduced showing the percentage figure quoted by plaintiff was in fact too high, and evidence concerning the government payments was excluded. A directed verdict for plaintiff was entered. In reversing the trial court, the Supreme Court of Illinois ruled that the question of the percentage should have been given to the jury and that the evidence of government subsidies was improperly excluded. REQUIREMENTS AND COSTS OF ALTERNATIVE SYSTEMS FOR TREATING PEACH CANNERY WASTES.
Clemson Univ., S.C. Water Resources Research Inst.
G. H. Liner, and J. M. Stepp.
Water Resources Research Institute, Report No. 15, p. 1-75, April 1970. 16 fig, 19 tab, 33 ref. OWRR Project A-002-SC (15).

Descriptors: *Canneries (Peach), *Waste water treatment, *Cost comparisons, Spray irrigation, Oxidation lagoons, Aeration.

Waste water treatment disposal by small seasonal peach canneries was studied, including description of the relevant practices of nine South Carolina canneries in 1966. The technical requirements for oxidation lagoons, aerated lagoons and spray irrigation systems of waste-water disposal by peach canneries of five sizes were studied. The costs of constructing and operating each type and size of facility under South Carolina conditions as of 1967 and the effect of land values upon comparative costs were investigated. Non-land costs per unit of output were lowest for spray irrigation systems for all sizes of canneries, but as assigned land costs were increased to a relatively high level most of the least-cost 'positions' were occupied by aerated lagoons. ACKERMAN V TOWNSHIP OF NORTH HUNTINGDON (MUNICIPAL AUTHORITY TO GRANT RIGHTS IN PRIVATELY OWNED SEWER LINE).

261 A2d 570-573 (Penn 1970).

Descriptors: *Pennsylvania, *Local governments, *Sewers, *Pipelines, Waste disposal, Municipal wastes, Domestic wastes, Disposal, Sewage disposal, Cities, Contracts, Legal aspects, Judicial decisions, Public rights, Sewage districts, Remedies, Assessments, Cost sharing, Construction.
Identifiers: *Injunction (Restraining).

Plaintiff developer brought action to enjoin defendant township and another developer from connecting into a sewer line which plaintiff constructed, pursuant to a contract with the township, for his and other developments as part of an overall sewage disposal plan. After the sewer line was completed, but before title passed to the township, the township authorized defendant developer to tap into the line. Plaintiff contended that defendant township had no authority to authorize defendant developer to make use of a sewer line to which the township had no title. Defendants argued that since the sewer was part of an overall plan and since the permits for the line were issued to the township, the township was the owner of the line. The court held that, under the terms of the contract, title to the line was clearly in plaintiff. Therefore, defendant developer was without valid permission to transport sewage through the line. However, the court felt that injunctive relief was improper as it would cause more harm than the interest protected, and remanded the case to assess defendant developer for a proportionate share of the cost of the sewer line. (Liptak-Florida)
W70-09053

HONEBEIN V MONTICELLO (DEED TO LAKE FRONTAGE AS NOT EXTENDING OWNERSHIP TO LAKE BED).

263 App Div 745, 31 NYS2d 532-534 (Sup Ct 1941).

Descriptors: *New York, *Ownership of beds, *Lake beds, *Boundaries (Property), Beds under water, Beds, Real property, Judicial decisions, Legal aspects, Lakes, Docks, Watercourses (Legal), Prescriptive rights, Remedies, Maintenance, Land, Local governments, Water law, Relative rights, Boundary disputes.
Identifiers: Adverse possession.

Plaintiff-grantee to lake front land contended that her deed gave her title to the center of the lake bed abutting her property. Defendant village denied plaintiff's contentions and claimed the deed to plaintiff's lake front land restricted her ownership to the edge of the lake. Defendant also claimed title to the disputed lake bed by adverse possession. The majority of the court held for defendant. The dissenting opinion would have upheld plaintiff's claim of ownership to the center of the lake bed by construction of law, as the description in plaintiff's deed did not expressly restrict her ownership to the edge of the lake nor was the title to the center of the watercourse expressly withheld. Moreover, the dissent stated that defendant's claim of adverse possession was negated by plaintiff's sufficient showing of possession to the lake bed by the maintenance of a dock over the lake waters. (Finman-Florida)
W70-09054

BD OF EDUC V NORTH HEMPSTEAD (NO RIGHT TO DAMAGES FOR NATURAL FLOW OF SURFACE WATERS).

261 App Div 1102, 27 NYS2d 114-115 (Sup Ct 1941).

Descriptors: *New York, *Drainage systems, *Natural flow, *Surface runoff, Surface waters, Drainage engineering, Land, Culverts, Drainage, Contours, Legal aspects, Judicial decisions, Remedies, Damages, Cities, State governments, Overland flow, Pipe flow, Regulated flow, Discharge (Water), Pipes, Maintenance, Rain, Volume, Flow augmentation.

Plaintiff school district's land was naturally contoured so that surface waters flowed over such land into a culvert constructed by the state. Defendant town constructed a catch basin system near plaintiff's land for the drainage of rain and surface waters. Plaintiff sought to restrain defendant from discharging surface waters upon its land and sought damages to such land due to the construction and maintenance of the catch basin system. The appellate court stated that plaintiff had failed to show that defendant's catch basin system, in fact, caused an increased volume of water upon its property. Furthermore, the court noted plaintiff's failure to prove that defendant should have installed larger drain pipes to adequately drain surface waters. Moreover, while defendant might have been liable for an increased volume of surface waters flowing over plaintiff's land due to the construction and maintenance of the catch basin system, it would not be held liable in this case for the natural flow of surface waters over such land. (Finman-Florida)
W70-09055

HOPKINS V UPPER SCIOTO DRAINAGE AND CONSERVANCY DIST (NO DAMAGES FOR IMPROPER MAINTENANCE OF DRAINAGE DISTRICT'S WATERWAYS).

57 Ohio App 505, 37 NE2d 430-432 (1940).

Descriptors: *Ohio, *Drainage districts, *Water injury, *Drainage effects, Administration, Governments, State governments, Maintenance, Ditches, Obstruction to flow, Land, Crops, Drainage systems, Damages, Regulation, Legal aspects, Judicial decisions, Remedies, Conservation, Potatoes, Political aspects, Management, Standards, Legislation.

Defendant drainage and conservancy district, a political subdivision of the state, was alleged to have been negligent in failing to maintain its waterways or ditches in such a manner as to allow the unobstructed flow of water in such district. Plaintiff private landowner sought damages for the destruction of his potato crop which allegedly resulted from defendant's negligent maintenance of its drainage system. Defendant denied its liability for plaintiff's damages. The court noted that defendant was on instrumentality of the state and, in the absence of a statutory provision to the contrary, such instrumentality was not to be held liable for injuries incurred in connection with the exercise of its governmental functions. In view of the fact that the only applicable statutory provision provided that no damages would be allowed if not otherwise allowed in law and expressly prohibited the imposition of any liability for destruction of crops due to improper maintenance of a conservancy district's waterways or ditches, the court ruled that plaintiff was precluded from bringing the action, and dismissed the petition. (Finman-Florida)
W70-09057

VARNEY RIVER DRAINAGE DIST V SPIEDEL (ASSESSMENTS ON LAND HELD BY EQUITABLE TITLE).
152 SW2d 54-58 (Mo 1941).

Descriptors: *Missouri, *Federal government, *Assessments, *Land tenure, Legislation, Drainage districts, State governments, Regions, Local governments, Judicial decisions, Legal aspects, Taxes, Swamps, Land reclamation, Benefits, Economics, Real property, Patents, Proprietary power, United States, Public lands, Federal government.
Identifiers: *Equitable title.

Plaintiff drainage district sought to collect delinquent drainage assessments on defendant's land for improvements made under authority of state law. Defendant contended the assessments against his land were void since the state had no authority to make them. On the basis of the Swamp Land Act of 1850 and a prior case, defendant argued that the United States held title to the land prior to 1933, when the improvements were made thereon. Defendant argued that the Act gave Missouri no legal title to the land which it could convey until it acquired patents to the area from the United States in 1933. Therefore, no tax could be imposed for improvements made on the property while it was legally owned by the United States. The court rejected defendant's contention and held that the Act gave the state of Missouri a beneficial interest in the swampland. When the state legislature donated the land to the counties, a patent from the county to subsequent owners conveyed an existing right, which carried legal title with it when it was officially determined that the swampland fell under the Act. The grantee acquired sufficient equitable title to be subject to assessments for improvements. (Hubener-Florida)

SANDERS V ROSE (PROPERTY BOUNDARY AS AFFECTED BY CHANGE IN COURSE OF STREAM).

296 Ky 25, 176 SW2d 119-122 (1943).

Descriptors: *Kentucky, *Boundaries (Property), *Boundary disputes, *Channels, Legal aspects, Streams, Water law, Water rights, Routing, Judicial decisions, Land tenure, Real property, Prescriptive rights, Adjudication procedure, Avulsion, Relative rights.

Plaintiff and defendant owned adjoining farms, the boundary line between the farms being formed by a creek. A sudden change in the creek's course had moved the thread of the creek approximately 500 feet. Plaintiff sued to quiet title to the land between the old and new locations of the creek, contending that all the deeds in plaintiff's and defendant's chain of title, which established the property line at the creek, referred to the location of the creek prior to the sudden change. Defendant counterclaimed, asking that her title be quieted, and contended that the deed to her father referred to the creek at its new location. On appeal from a judgement for defendant, the court held that the weight of the evidence showed that all of the deeds referred to the channel of the creek as it was prior to the sudden change. The court noted that even if, as the chancellor had found, the deed to defendant's father referred to the creek's new location, defendant would have had to claim adverse possession for the statutory period in order to perfect her title. DICKSON V SANDEFUR (DISPUTED OWNERSHIP OF LAND APPEARING AFTER SUDDEN SHIFT IN RIVER'S COURSE).
235 So 2d 579-593 (La Ct App 1970).

Descriptors: *Louisiana, *Avulsion, *Accretion (Legal aspects), *Boundary disputes, Boundaries (Property), Floods, Bank erosion, Land tenure, Real property, Judicial decisions, Legal aspects, Navigable rivers, Sedimentation, River flow, Alluvium, River beds, Soil, River basins, Channel erosion, Channel morphology, Riparian land.
Identifiers: *Re-emergence of lands.

Plaintiff and defendant owned land on opposite sides of a bend in the Red River. After a heavy spring flood the river changed its course. Plaintiff brought a possessory action claiming ownership of land on his side of the river which had appeared after the sudden cutoff by the river. The court gave judgment for plaintiff. Defendant filed a reconventional petitory action claiming ownership of land over which the river had formerly flowed further along the bend. Defendant claimed the land pursuant to a state statute providing that where a river opens a new bed owners of soil newly occupied by the river shall take the former bed. Defendant alleged that the land had appeared by an avulsive action of the river. The court held that defendant failed to sustain the burden of proof in establishing that an avulsive action occurred in the area he claimed. The court found that the land in question had been created by accretion to the opposite bank and such deposit belonged to the owners of those banks. Since the land was found to be the result of accretion, the court also rejected defendant's contention that the lands were subject to the doctrine of re-emergence of land after submergence. (Hubener-Florida)

DALY V NEW YORK (DAMAGES TO CROPS FROM BARGE CANAL CONSTRUCTION).

262 App Div 661, 30 NYS2d 717-720 (1941).

Descriptors: *New York, *New York State Barge Canal, *Flood damage, *Crops, Damages, Flooding, Canals, Surface water, Canal construction, Potatoes, Agriculture, Land use, Judicial decisions, Legal aspects, Water law, Governments, Floods, Floodwater, Water injury, Overflow, Dams, Valleys, Remedies.

Plaintiffs, landowners along a creek which was part of the New York State Barge Canal, brought an action for damages caused by flooding of their lands. Plaintiffs claimed that due to the construction and operation of the Canal, their lands were flooded and their potato crops severely damaged. Defendant claimed that similar damage had occurred prior to the building of the Canal and that the damage complained of was not caused by the Canal. The Supreme Court of New York, Appellate Division, ruled that the evidence was sufficient to show that the flooding was caused by the Canal and that therefore the state was liable for the damage. The judgment of the trial court was affirmed. (Barker-Florida)
W70-09061

IN RE EAST RIVER DRIVE (VALUATION OF SCENIC EASEMENTS IN CONDEMNATION PROCEEDINGS).
264 App Div 555, 35 NYS2d 990-1001 (1942).

Descriptors: *New York, *Condemnation value, *Eminent domain, *Scenic easements, Condemnation, Easements, Legal aspects, Right-of-way, Compensation, Water law, Judicial decisions, Local governments, Riparian rights, Access routes, Real property, Remedies, Property values, Roads, Highways, Embankments, Bridges, Roadbanks, Retaining walls, Concrete structures, Zoning.

Plaintiff city instituted condemnation proceedings to obtain river frontage for construction of a concrete, triple-deck viaduct. Defendant coal yard operator, who owned land located along the river, received damages for land taken, riparian rights and destruction of improvements, but contended that he was also entitled to consequential damages to the residue because the land was no longer suitable for apartments, which was conceded to be the 'best use' of the land, the viaduct having obstructed the view of the river. Co-defendant apartment owner received damages for the destruction of his riparian rights and consequential damages for obstruction of his easement of view, but contended that the consequential damages were inadequate. Plaintiff contended that, as to the coal yard, there was no damage to the improvements since a coal yard was an inadequate use of property zoned for apartments. As to the defendant apartment owner, plaintiff contended that there was no consequential damage since none of the apartment owner's property was taken. The court held, as to defendant coal yard operator, that damages were proper where the present business use was destroyed, notwithstanding that such use was not the best use of the property. As to defendant apartment owner, the court held that real property included easements and riparian rights and that a taking thereof necessitated consequential damages. (Liptak-Florida)
W70-09062

NIAGARA FALLS POWER CO V DURYEA (RIGHT OF STATE TO CHARGE FOR WATER USE).
57 NYS 2d 777-787 (Sup Ct 1945).

Descriptors: *New York, *Hydroelectric power, *Public rights, *Preferences (Water rights), Relative rights, Water rights, Riparian rights, Water utilization, Diversion, Navigable rivers, Water policy, Legislation, Water resources, Water costs, Electric power industry, Administrative agencies, Competing uses, Judicial decisions, Legal aspects, Eminent domain, Beds under water, Ownership of beds, Governments.

Plaintiff power company brought suit against the Water Power and Control Commission of New York to have a statute nullified. The statute imposed a rental on water rights which plaintiff claimed as a previously acquired vested property right. Through a series of earlier statutes, plaintiff had been granted the rights to divert water from the Niagara River and now claimed that the Commission could not charge for such rights. Defendant claimed the right to charge rental for the diverted waters through the power of the state over navigable public waters. The Supreme Court of New York found that the Niagara River was a natural resource of the state and that the state had the power to preserve to the public the energy of the river regardless of any rights in private interests it may have previously created or allowed. The statute was designed expressly for the preservation of the public rights to the water, and thus the state could validly charge for diversion thereof. (Barker-Florida)
W70-09063

JAMES V DRAVO CONTRACTING CO (STATE'S RIGHT TO TAX FEDERAL GOVERNMENT'S CONTRACTORS).
302 US 134, 58 S Ct 208-233 (1937).

Descriptors: *West Virginia, *Taxes, *Dam construction, *Federal government, Damsites, Federal reclamation law, Federal jurisdiction, State jurisdiction, Legislation, Permits, Regulation, Judicial decisions, Governments, State governments, Legal aspects, Contracts, Navigable rivers, Ownership of beds, Jurisdiction, Navigation.

West Virginia imposed a tax upon the gross receipts of respondent contractor for construction work done for the United States on dams and locks of a navigable river in West Virginia. Respondent brought suit to restrain the tax. The district court granted a permanent injunction against the tax. On appeal the United States Supreme Court held the questions presented were: (1) whether the state had territorial jurisdiction to impose the tax; (2) whether the tax placed an invalid burden on the federal government. The Court held that West Virginia could not impose a tax on work done by respondent outside of the state. Also, no tax could be imposed on work on any West Virginia site over which the United States retained exclusive jurisdiction. Exclusive jurisdiction did not mean the paramount authority of the United States over certain lands and rivers to provide for navigational or other improvements. The Court determined that the United States had not retained exclusive jurisdiction over the damsites in question. Since the tax was not imposed upon a government instrumentality, it did not present an intolerable burden. Therefore, the Court reversed the district court and upheld the tax. (Hubener-Florida)

HINDERLIDER V LA PLATA RIVER AND CHERRY CREEK DITCH CO (EQUITABLE APPORTIONMENT OF INTERSTATE STREAM THROUGH USE OF INTERSTATE COMPACT).
304 US 92, 58 S Ct 803-811 (1938).

Descriptors: *Equitable apportionment, *Interstate rivers, *Interstate compacts, *Prior appropriation, Appropriation, Diversion, Beneficial use, Proration, Streams, Adjudication procedure, Water rights, Water law, Judicial decisions, Water allocation (Policy), Federal jurisdiction, State jurisdiction, Irrigation water, Non-navigable streams, Priorities, Preferences (Water rights), State governments, Federal government, Water policy, Legal aspects, Relative rights.
Identifiers: *Injuction (Mandatory).

Plaintiff Colorado ditch company sought a mandatory injunction to restrain defendant state engineer of Colorado from depriving plaintiff of water used for irrigation. Plaintiff contended that its right to appropriate the water from an interstate stream had been established in prior state proceedings. Defendant contended that his water management policy was governed not by the prior proceedings, but by a river compact made by Colorado and New Mexico and ratified by Congress. Reversing the state court decision for plaintiff, the Supreme Court of the United States held that water in interstate streams must be equitably apportioned between states. Therefore, the state court proceeding was not res judicata with respect to the water rights of citizens of Colorado, since the state could only apportion to its citizens rights which represented the state's equitable share of the water in the stream. The terms of the compact were binding upon all claimants to water rights in those states that were parties to the compact. (Liptak-Florida)
W70-09065

ARIZONA V CALIFORNIA (RELATIVE RIGHTS IN COLORADO RIVER WATER).

298 US 558, 56 S Ct 848-855 (1936).

Descriptors: *Arizona, *California, *Appropriation, *Colorado River, Water rights, Prior appropriation, Equitable apportionment, Federal jurisdiction, Federal-State water rights, Conflicts, Legal aspects, Judicial decisions, Relative rights, State jurisdiction, Water law, Interstate rivers, Navigable rivers, Navigation, Adjudication procedure, Diversion, Preferences (Water rights).
Identifiers: *Boulder Canyon Project Act.

Arizona filed a suit against California and all other states of the Colorado River Basin seeking: (1) that Arizona's equitable share of Colorado River water, subject to diversion and use, be fixed by the Court; (2) that California be barred from claiming and using more than an equitable share of the river water not to exceed the limit imposed by the Boulder Canyon Project Act; (3) a decree that diversion and use of any of Arizona's share by a defendant state did not confer an appropriative right on the diverting state; and (4) that Mexico's equitable share be supplied from California's equitable share. The United States Supreme Court held that Arizona could not act to exempt available water from appropriation until such time as the other state might want to appropriate it. A justiciable controversy would be presented only if Arizona had present rights in the unappropriated water. The court dismissed the suit on the ground that the United States, which was not a party, had a paramount power to control the unappropriated waters for the purpose of improving navigation. The United States was an indispensable party in whose absence the water could not be apportioned. (Hubener-Florida)
W70-09066

ICKES V FOX (INCREASED WATER RATES IMPOSED CONTRARY TO LAW).

300 US 82, 57 S Ct 412-418 (1937).

Descriptors: *United States, *Federal reclamation law, *Water rates, *Remedies, Water utilization, Water users, Costs, Water distribution (Applied), Water rights, Administrative agencies, Federal jurisdiction, Irrigated land, Water contracts, Relative rights, Judicial decisions, Legal aspects, Beneficial use, Irrigation water, Construction, Federal government, Taxes, Washington, Adjudication procedure.
Identifiers: *Injunction.

Plaintiff landowners created a water user association and included their lands within a reclamation project under the Reclamation Act of 1902. The association entered into a contract with the United States to provide construction of irrigation works pursuant to the Act. The amount of water used by each member was to be determined by the government based upon the beneficial use of the water to such land. An act of Congress was passed providing that no increase of construction charges would be made except by special agreement with a majority of the water users. To finance expansion of irrigation works, the government sought to increase the charges for the use of the water without such agreement. Plaintiff landowners brought suit to enjoin the Secretary of the Interior from enforcing the increased water rates. Plaintiffs contended such increase would deprive them of their vested rights in the water. The federal government contended that it was an indispensable party whose sovereign immunity had not been waived. The court held that the exemption of the United States from liability did not protect its officers in their individual capacity, and in the case of an injury threatened by the Secretary's illegal action, he could not claim immunity from the injunctive process. (Barnett-Florida)
W70-09067

UNITED STATES V SPONENBARGER (ALLEGED TAKING OF PRIVATE PROPERTY WITHOUT JUST COMPENSATION VIA FLOOD CONTROL PLAN).

308 US 256, 60 S Ct 225-231 (1939).

Descriptors: *Arkansas, *Eminent domain, *Levees, *Floodways, Channel improvement, Flood control, Flood protection, Flood routing, Floodproofing, Flow control, River regulation, Routing, Water control, Diversion structures, Cutoffs, Flood damage, Spillways, Spillway crests, Watercourses (Legal), Mississippi River, Legislation, Judicial decisions, Legal aspects, Damages, Compensation.

Plaintiff brought action against the United States to recover compensation for the alleged taking of land resulting from the Mississippi Flood Control Act of 1928. Plaintiff's property was within a proposed floodway authorized by the Act. Plaintiff alleged that the mere fact the Act was in effect imposed a

servitude on her land for the purpose of intentional future flooding. Plaintiff further contended that her right of self-defense against floods through locally built levees was taken away the the 1928 Act. The Supreme Court, in holding for the United States, found that plaintiff's land was situated in the natural floodway of the Mississippi River and had not been subjected to any servitude from excessive floodwaters which had not already existed prior to 1928, and that her property had actually benefited by the government's impoundments. Furthermore, the mere possibility her land might be flooded, which possibility existed before the government's project, did not constitute the taking of private property without just compensation. The Court rejected the contention that the Act imposed a servitude for future flooding since the proposed flooding might never occur, especially since the construction of the floodway in question had been abandoned. Finally, the Court held that no right of self-defense against floods had been taken as the United States had not yet built or acquired levees as authorized by the Act. (Price-Florida)
W70-09068

DANFORTH V UNITED STATES (COMPENSATION FOR TAKING OF PRIVATE PROPERTY).
308 US 271, 60 S Ct 231-237 (1939).

Descriptors: *Missouri, *Compensation, *Condemnation value, *Eminent domain, Condemnation, Right-fo-way, Federal jurisdiction, Federal government, Levees, Flood control, Easements, Mississippi River, Floodways, Drainage, Diversion, Diversion structures, Legislation, Spillways, Legal aspects, Judicial decisions.

Defendant landowner brought certiorari to review a district court and circuit court of appeals decision in favor of petitioner United States in a condemnation suit. Defendant had been awarded for land flooded by petitioner compensation less in amount than was agreed to by the parties prior to the suit. Moreover, defendant objected to the fact that no provision was made as to the interest to be paid thereon. The United States Supreme Court held that the amount agreed to by the parties was binding in that the offer had been accepted prior to the government's attempt to withdraw the offer. However, the time of the taking of the property is when compensation is paid unless taking occurs prior thereto in actuality or by statutory provision. Therefore, no interest had accrued on the amount agreed upon. The decree was affirmed in part and reversed in part. (Price-Florida)

YEARSLEY V W A ROSS CONST CO (LIABILITY OF PRIVATE CORPORATION ACTING PURSUANT TO AN ACT OF CONGRESS).
309 US 18, 60 S Ct 413-415 (1940).

Descriptors: *Accelerated erosion, *Channel improvement, *Compensation, *Legislation, Nebraska, Accretion (Legal aspects), Bank erosion, Erosion, Soil erosion, Damages, Alteration of flow, Navigable waters, Navigable rivers, Missouri River, Channel morphology, Dikes, Legal aspects, Judicial decisions, Riparian waters, Riparian land, Federal government.

Defendant construction company had built dikes in the Missouri River and, using large boats with paddles and pumps, had produced artificial erosion of part of plaintiffs' land. Plaintiff landowners sought to recover damages. Defendant alleged that the work was done pursuant to contract with the United States government, as authorized by an act of Congress. Defendant further alleged that its actions had only hastened the inevitable and were done to improve the navigation of the river. Plaintiff contended that the contract did not contemplate the taking of property without just compensation in violation of the fifth amendment. A decree for plaintiff was reversed in the circuit court. The Supreme Court held that since the act was done pursuant to an act of Congress, defendant could incur no liability. If plaintiff's fifth amendment rights had been violated, the government had impliedly promised to pay, and a suit in the court of claims was the appropriate remedy. Plaintiffs' remedy was against the government, and not against its representative. The judgment of the circuit court was affirmed. (Price-Florida)
W70-09070

OKLAHOMA EX REL PHILLIPS V GUY F ATKINSON CO (INJUNCTION AGAINST DAM CONSTRUCTION).
313 US 508, 61 S Ct 1050-1064 (1941).

Descriptors: *Oklahoma, *United States, *Dams, *Navigation, Eminent domain, Governments, Flood control, Damsites, Dam design, Maximum probable flood, Reservoirs, Water control, Multiple-purpose projects, Hydroelectric power, Economics, Navigable rivers, Mississippi River Basin, Regions, Interstate, Costs, Legislation, Judicial decisions, Legal aspects, Project planning, Relative rights.
Identifiers: *Red River.

Oaklahoma brought a suit seeking to enjoin construction of a dam on the Red River by the United States. The state contended that the resulting reservoir would innundate a large tract of land and would thus interfere with existing public and private interests in the land. The state further claimed that the Red River was non-navigable in the proposed area, that Congress had no power over the water, and that the dam was a multiple-purpose project. Defendant argued that the dam was part of an overall scheme to protect the Mississippi River Basin, that the navigable portion of the Red River would be benefited and that the income derived from the sale of power from the dam operation would help finance the over-all project. The U. S. Supreme Court ruled that Congress has authority through the power over the waters of a river if any part of it is navigable and that the flood control program was part of the commerce power. The fact that ends other than flood control would result from an exercise of the commerce power would not invalidate that exercise. The injunction was denied. (Barker-Fla)
W70-09071

PUERTO RICO V RUSSELL AND CO (IMPOSED TAX AS IMPAIRMENT OF CONTRACT FOR WATER SUPPLY).

315 US 610, 62 S Ct 784-791 (1942).

Descriptors: *Puerto Rico, *Contracts, *Taxes, *Supply contracts, Water delivery, Irrigation systems, Drainage districts, Riparian rights, Governments, Assessments, Costs, Operating costs, Dams, Relative rights, Water costs, Water supply, Water distribution (Applied), Competing uses, Water rights, Judicial decisions, Legal aspects, Water policy, Water demand, Supervisory control (Power).
Identifiers: *Constitutionality.

Puerto Rico brought an action to collect taxes imposed on lands of defendant, who was using water from a public irrigation system. When the dam which was part of the system was constructed, riparian owners below the dam site, whose lands were not within the drainage district, were offered contracts for delivery of water in return for their giving up their rights to the water to be used in the irrigation system. Defendant's predecessor has accepted such a contract, and defendant argued that if a tax were imposed on his land for the water use, the obligation of contract would be impared. Puerto Rico argued that the contract entered into was beyond the authority of the commissioner of the drainage district. The United States Supreme Court ruled that where a tax is imposed on land outside of a drainage district on water use stemming from a contract for delivery of such water in consideration of suspension of water rights, such a tax is an impairment of contract. It was also held that the commissioner was empowered by statute to make such contracts. (Barker-Fla)
W70-09072

UNITED STATES V WILLOW RIVER POWER CO (IMPAIRED EFFICIENCY OF HYDROELECTRIC PLANT CAUSED BY RAISING THE WATER LEVEL OF THE RIVER ON WHICH IT WAS LOCATED).

324 US 499, 65 S Ct 761-770 (1945).

Descriptors: *United States, *Hydroelectric plants, *Compensation, *Riparian rights, Public utilities, Condemnation value, Non-navigable waters, Eminent domain, Rivers, Judicial decisions, Legal aspects, Dams, Riparian land, Wisconsin, Electric power production, Power head, Navigable waters, Tailwater, High water mark, Federal government, Federal jurisdiction, Property values, Reasonable use, Ownership of beds, Usufructuary rights, Relative rights.

Plaintiff power company erected a dam on a navigable river appurtenant to its riparian lands. The dam enabled the company to generate a greater power head. At a later date, defendant United States built a dam downstream from plaintiff for the purpose of aiding navigation. This dam increased the water level of the river and thus decreased plaintiff's power head. Plaintiff brought action to recover compensation for the impaired efficiency of its hydroelectric plant caused by defendant's actions. Plaintiff alleged that such action was a 'taking' of private property for which just compensation was required. The court of claims found the loss of power to be a property right for which a 'taking' by the government must be compensated. The United States Supreme Court reversed, and held that the fundamental principle of riparian rights is that each riparian proprietor has an equal right to make reasonable use of the waters. However, such right on a navigable stream is subject to a dominant public interest in navigation. Thus, in the instant case, no property right was taken, and no compensation was recoverable. (Barnett-Fla)
W70-09073

UNITED STATES V DICKINSON (EMINENT DOMAIN BY RAISING LEVEL OF RIVER PURSUANT TO CONSTRUCTION OF DAM).
152 F2d 865-871 (4th Cir 1946).

Descriptors: *Eminent domain, *Dams, *Backwater, *Condemnation value, Erosion, Legal aspects, Engineering structures, Damages, Flood damage, Rivers, Navigable rivers, Riparian land, Navigation, Relative rights, Floods, Federal government, United States, Judicial decisions, Water levels, Compensation, Real property.

In an action for damages, plaintiff contended that the raising of the water level of a river by the construction of a dam had permanently submerged a portion of his land and had caused the remaining, unsubmerged land to be damaged by erosion so as to constitute a taking of property entitling plaintiff to compensation. Defendant federal government contended that the suit was barred by a statute of limitation and in the alternative admitted liability for the submerged land but contended that the damages to the unsubmerged land did not constitute a taking of property in that the damages were consequential resulting from the exercise of a paramount governmental power to improve navigation. The court held that the suit was not barred in that the action accrued when the water level was finally established and not when the level was initially raised. The court ruled that the defendant was liable for damages to the unsubmerged land in that when part of an owner's land is completely taken, he is entitled not only to compensation therefore but also to compensation for any damage occassioned to his remaining land. (Snow-Fla)
W70-09074

DUKE POWER CO V TOMS (POWER COMPANY'S RIGHT TO FLOOD ACCOMPANIED BY DUTY TO PAY DAMAGES).
118 F2d 443-449 (4th Cir 1941).

Descriptors: *North Carolina, *Easements, *Dam construction, *Compensation, Power operation and maintenance, Electric power, Electric powerplants, Damages, Construction, Flooding, Judicial decisions, Legal aspects, Maintenance, Floods, Remedies, Public utilities, Dams, River flow, Rivers, Obstruction to flow, Underground, Mining, Mineralogy, Flow, Eminent domain.
Identifiers: *Mineral rights.

Defendant electric power company constructed a power dam which partially impounded the waters of a river. As a result, a portion of the lands in which plaintiffs held mineral rights became flooded. Plaintiffs claimed that this flooding had interfered with their right of access to the minerals below the surface, and that this amounted to the taking of property without just compensation. Defendant asserted its right as a public service corporation to maintain its dam and flood the land in which plaintiffs claimed mineral interests. Plaintiffs brought action to quiet title to the lands in controversy. The court noted that this action was basically concerned with defendant's acquisition of an easement of flowage which interfered with plaintiffs' easement of access. The court held that as defendant was a public service corporation which enjoyed the right of eminent domain, it was entitled to maintain its dam and flood the lands in controversy, even though this might interfere with plaintiffs' right of access to the minerals contained below the surface of the lands. However, the court stated that plaintiffs had a right to any permanent damages which resulted from the flooding. (Finman-Fla)
W70-09075

KUHN V CHESAPEAKE AND O RY (EFFECT OF CHANGE OF NATURAL WATERCOURSE ON PROPERTY BOUNDARIES).

118 F2d 400-405 (4th Cir 1941).

Descriptors: *Boundaries (Property), *Boundary disputes, *Channel flow, *Alteration of flow, Judicial decisions, Land tenure, Legal aspects, Natural flow doctrine, Proprietary power, Relative rights, Riparian land, Riparian rights, Riparian waters, Watercourses (Legal), Islands, Rivers, River flow, River beds, Channels, Streams, Deflection, Diversion.

The land in controversy consisted of about 9 acres which had formerly been an island between 2 branches of a river which, by deed from a common grantor, formed the boundary between plaintiff's and defendants' land. Neither party's deed contained a reference to the island. In the course of a flood, the right branch of the river filled with earth and debris and dried up. Both parties claimed title to the land which had formerly constituted the island. The trial court instructed the jury that the channel which they found to have been the main one before the flood would constitute the proper boundary. The circuit court of appeals reversed, stating that a determination of which of the channels was the main one was a significant factor to be considered by the jury in ascertaining the proper boundary, but it should not have been singled out as the sole factor for consideration. (Clarke-Fla)
W70-09076

CARTER OIL CO V WATSON (BOUNDARY DISPUTE WHERE LAND CONVEYED BORDERED ON A STREAM).
116 F2d 195-198 (7th Cir 1940).

Descriptors: *Illinois, *Boundary disputes, *Boundaries (Property), *Ownership of beds, Judicial decisions, Legal aspects, Land tenure, Riparian land, River beds, Water law, Oil industry, Oil wells, Gases, Watercourses (Legal), Streambeds, Streams.

Plaintiff oil company sought to enjoin defendant from drilling for oil and gas on property to which both plaintiff and defendant claimed title. Plaintiff relied on a 1905 deed which he contended gave him title to the land to the middle of the creek adjacent thereto. Defendant contended the deed conveyed the property only to the bank of the creek. To avoid the well settled law that a grant of land bordering on a river carries with it title to the center of the stream, defendant relied on the working of his deed. He argued that the terms of the grant showed an intention to set the boundary at the stream's edge, especially since streams are often referred to in deeds as monuments and are regarded as such when the land conveyed abutts upon them. The appellate court held that, although the language of the deed was awkward, the intention of the parties was clear. The boundary line was the middle of the creek. Consideration of extrinsic evidence, along with the language of the deed, supported this conclusion. The lower court decision for the plaintiff was affirmed. (Price-Fla)
W70-09077

BABCOCK V MISSISSIPPI RIVER POWER CO (INJURY TO LAND VIA DAM CONSTRUCTION).
113 F2d 398-400 (7th Cir 1940).

Descriptors: *Illinois, *Impounded waters, *Flood damage, *Compensation, Impoundments, Flooding, Cultivated lands, Drainage, Damages, Flood protection, Flow control, Floodwater, Floodways, Dams, Judicial decisions, Legal aspects, Land use, Legislation, Water distribution (Applied), Water spreading, Watershed management, Water storage, Water works, Mississippi River, Overflow.

Plaintiff landowner brought action against defendant power company to recover for flood and overflow damages which resulted from the erection of a dam, pursuant to an act of congress, across the Mississippi River. As a result of defendant's dam, part of plaintiff's land, which was leased for the purpose of farming, was rendered useless for cultivation. Plaintiff sought to recover only for recurring and intermittent damages. The court determined the cause of action stated by plaintiff resided only in the lessee of his lands. Plaintiff would have had a cause of action for permanent damages, but had not sought such. The granting of the motion to dismiss was affirmed. (Price-Fla)
W70-09078

FLORIDA BLUE RIDGE CORP V TENNESSEE ELECTRIC POWER CO (RELATIVE RIGHTS IN PROPERTY SUBJECT TO EASEMENTS).
106 F2d 912-916 (5th Cir 1939).

Descriptors: *Georgia, *Electric powerplants, *Easements, *Condemnation, Public utilities, Electric power, Electric power industry, Judicial decisions, Legal aspects, Right-of-way, Water utilization, Land tenure, Real property, Flow control, Industrial water, Land use, Lakes, Dams, Backwater, Water levels, Overflow.

Plaintiff corporation brought action against defendant power company to have flowage easements over plaintiff's land in Georgia declared abandoned and to obtain an injunction against trespass by defendant. Plaintiff contended that: (1) the original transfer of the easements to defendant by another corporation was void; (2) defendant, in acquiring the easements, had really acquired a franchise to sell electricity which was not transferable under public utility regulations; and (3) the easements had ceased when conveyed to defendant because they had been created by condemnation and the condemnor was now a dissolved corporation. The court held for defendant, stating that the transfer of the easements had complied with Georgia law. Further, the corporate charter gave the transferor the usual power to sell any or all of its property; this would include the easements in issue. The taking of the easement by condemnation was perpetual unless otherwise provided for, and compensation for lands overflowed was presumably paid. Moreover, the state was the only proper party to attach th sale of the easement on the allegation that it su pressed competition in violation of public polic (Hubener-Fla)
W70-09079

FRANKLIN V UNITED STATES (CONSEQUEN TIAL DAMAGE FROM FEDERAL DIKE CO STRUCTION IN IMPROVEMENT OF NAVIGA TION).
101 F2d 459-469 (6th Cir 1939).

Descriptors: *Dikes, *Alteration of flow, *Dive sion, *Erosion, Barriers, Diversion structure Flood control, Beds, River beds, Channel erosio Ownership of beds, Rivers, Mississippi Rive Navigable rivers, Judicial decisions, Navigatio Bank erosion, Riparian land, Riparian rights, O struction to flow, Relative rights, Natural flo Federal government, United States.

Plaintiff riparian landowners brought action f damages, and contended that defendant Unite States, by the construction of a dike, had diverte the natural flow of the current of the Mississip River and that as a result of such change of curre plaintiffs' lands were washed away. Plaintif further contended that such constituted a taking lands for a public use so as to require compensatio under the fifth amendment. Defendant contende that the diversion of the current by the dike was improve navigation of a navigable river and was th exercise of a dominant right of the government that regard, and as such there was no taking of pr perty within the purview of the fifth amendmen The court held that defendant was not responsibl to riparian owners for consequential damages fro the deflection of waters by structures lawfully co structed in the aid of navigation. Such damages a not a taking of property in that there is no direct i vasion of the riparian's lands, such lands being su ordinate to the public right of navigation. (Sno Fla)

PIKE RAPIDS POWER CO V MINNEAPOLIS S P AND S S M RY (RELATIVE RIGHTS T RIVER BED AS BETWEEN BRIDGE OWNE AND DAM OWNER).
99 F2d 902-917 (8th Cir 1938).

Descriptors: *Ownership of beds, *Bridge *Navigable waters, *Eminent domain, Dams, Rela tive rights, Navigable rivers, Rivers, River bed Navigation, Riparian rights, Railroads, Damsite Judicial decisions, Riparian land, Beds, Right-o way, State jurisdiction, Land tenure, Federa government, Minnesota, Legal aspects, Condemna tion, Compensation.

In an action to enjoin defendant railroad compan from constructing a bridge over a navigable rive plaintiff power company contended that it, as riparian landowner, had the riparian right to th use of the river bed upon which the bridge was t rest. Defendant, having been vested by state la with the power of eminent domain, converted th action into one for condemnation of plaintiff lands and attendant riparian rights to the use of th beds. The question was whether or not the defe dant had to compensate plaintiff for the propert condemned. The defendant contended that by vi tue of having obtained permission from the federa government to construct the bridge it had a superi or right to the use of the beds and owed no com pensation. The court held that the federal govern ment's paramount right to regulate navigatio rendered riparian rights in navigable rivers servien to the federal rights. However, the granting of per mission to build a bridge was not an exercise o such plenary power. Thus, the taking of plaintiff property and riparian rights through eminen domain required just compensation. (Snow-Fla)

THOMAS B BISHOP CO V SANTA BARBARA COUNTY (MEANDER LINES AS BOUNDARIES).
96 F2d 198-203 (9th Cir 1938).

Descriptors: *California, *Boundaries (Property), *Patents, *Meanders, Boundary disputes, Judicial decisions, Legal aspects, Land tenure, Public benefits, Public rights, Seashores, High water mark, Low water mark, Sand pits, Surveys, Estimating, Mapping, Topography, Real property.

Plaintiff brought action in ejectment to recover land claimed to have been included in a patent to plaintiffs' predecessor by the United States. Defendant county contended: (1) that the land was part of the public domain as it was not on the Surveyor General's plat, and (2) that the meander lines thereon constituted the boundaries of the land patented. Plaintiff asserted that the survey of the land included in the patent stated that the land was bounded by the seashore. The court stated that meander lines are not boundary lines. In reversing the trial court's judgment for defendant, the court held that the true boundary of the land patented was the seashore and not the meander lines as there was no evidence to affirmatively disclose an intention to limit the grant to actual traverse lines. Seaward projections from the survey lines constitute part of the patented land, and the land here involved was such a projection. (Price-Fla)

VERDE RIVER IRRIGATION AND POWER DIST V SALT RIVER VALLEY WATER USERS' ASS'N (CONTRACTUAL RIGHTS TO DAMSITE).
94 F2d 936-941 (9th Cir 1938).

Descriptors: *Arizona, *Damsites, *United States, *Relative rights, Dams, Dam construction, Reservoirs, Water supply, Ditches, Irrigation districts, Diversion, Water utilization, Water users, Hydroelectric power, Easements, Right-of-way, Surveys, Contracts, Grants, Judicial decisions, Legal aspects, Irrigation ditches.

Plaintiff irrigation district had been granted rights-of-way to build dams in certain locations along a river. Such grants required submission of maps of the proposed damsites to the Secretary of the Interior for approval. Plaintiff contended that a dam which defendant had contracted to erect was to be built on a site previously included in the grant to plaintiff, and therefore plaintiff sought validation of his easements and a voiding of defendant's contract. Defendant argued that no map of the disputed site was submitted to the Secretary of the Interior for approval, and therefore plaintiff had acquired no rights in the specific area. The Ninth Circuit Court of Appeals ruled that since no map of the exact location had been presented, the Secretary could not have approved the grant of that site to the plaintiff. Therefore plaintiff had acquired no rights in the location, and defendant's contract for dam construction was valid. (Barker-Fla)

UNITED STATES V WABASHA-NELSON BRIDGE CO (COMPENSATION FOR CONSEQUENTIAL DAMAGES TO CONDEMNED RIGHT-OF-WAY).
83 F2d 852-856 (7th Cir 1936).

Descriptors: *Dams, *Right-of-way, *Water levels, *Condemnation value, United States, Condemnation, Engineering structures, Bridges, Rivers, Access routes, Easements, Eminent domain, Legal aspects, Compensation, Federal government, Percolation, Capillary conductivity, Judicial decisions, Damages, River training, Navigable rivers, Mississippi River, Relative rights.

In a condemnation proceeding, plaintiff United States, pursuant to plans to construct a dam, sought to obtain flowage easements upstream. Defendant bridge company's right-of-way, a roadway embankment leading to a bridge, was subject to such flowage easements in that the water level on the embankment would be raised. Defendant contended that the establishment of such an easement would constitute a taking of property and that the raised water level would, through percolation and capillary attraction, damage all of the roadway so as to entitle defendant to additional compensation. Plaintiff contended that it was liable only for the portion of the roadway actually invaded by the raised water level and that any other damages were merely consequential and thus not subject to compensation. The court held that where a portion of property is actually taken, the owner is entitled to compensation for the portion actually taken and for damages to the remainder of the land attendant to such taking. Thus defendant was entitled to compensation for damages to the entire roadway. (Snow-Fla)

MCALLISTER V SLOAN (FLOODING OF PROPERTY DUE TO DAM CONSTRUCTION).
81 F2d 707-711 (8th Cir 1936).

Descriptors: *Arkansas, *Flood damage, *Damsites, *Dam construction, Adjudication procedure, Judicial decisions, Legal aspects, Riparian land, Riparian waters, Riparian rights, Federal jurisdiction, Backwater, Damages, Compensation, Real property, Water injury, Flooding.

Plaintiff landowners sought double damages for injury to their land by flooding which resulted from defendant's construction of a dam below their property. Defendant was granted a directed verdict in the trial court. The Circuit Court of Appeals, Eighth Circuit, reversed, holding that plaintiffs' complaint had stated a common law cause of action for flooding of their lands, and that the complaint should not have been dismissed on mere technicalities. A new trial was ordered. (Price-Fla)
W70-09085

NE-BO-SHONE ASS'N, INC V HOGARTH (PUBLIC FISHING RIGHTS IN NAVIGABLE RIVERS).
81 F2d 70-73 (6th Cir 1936).

Descriptors: *Michigan, *Fishing, *Public rights, *Navigable rivers, Rivers, Beds, River beds, Navigable waters, Navigation, Ownership of beds, Riparian rights, Relative rights, Boating, Judicial decisions, Recreation, Sport fishing, Legal aspects, Usufructuary right, Non-navigable waters.

Plaintiff, owner of property through which a river ran, brought an action to have his rights in such river established and to have an injunction issued to stop various members of the public from fishing upon such river. Plaintiff contended that the stream was not navigable and that the public thus had no rights in such river since he, as owner of the bed of the river, held exclusive rights to the river. Defendants contended that the river was of a public character and consequently there existed a right of the public to fish therein. The court found that the river, though not navigable as to boats, had previously been used to float logs, thus establishing the river as capable of being used for the purposes of commerce and thus qualifying such river as public waters. The court recognized that plaintiff was the owner of the bed of the river by virtue of being the owner of the land which it traversed but held that if waters are public for any purpose, they are public for all purposes so as to establish a public fishing right in the river. W70-09086

PALM BEACH COUNTY V SOUTH FLORIDA CONSERVANCY DIST (DRAINAGE DISTRICT'S USE OF LEVEE FOR CONSERVATION PARAMOUNT TO COUNTY'S USE AS A PUBLIC ROAD).
170 So 630-633 (Fla 1936).

Descriptors: *Florida, *Drainage districts, *Levees, *Right-of-way, Roads, Local governments, Legislation, Prescriptive rights, Legal aspects, Judicial decisions, Water law, Public rights, Water resources development, Easements, Administrative agencies, Real property, Public lands, Land reclamation, Canals, Transportation, Water conservation, Canal embankments, State governments, Relative rights.

Plaintiff drainage district brought suit to enjoin defendant county commission from interfering with the reconstruction of a levee. Plaintiff had constructed the levee along a canal in 1917 and in 1921 it was leveled and used as a public road. When plaintiff began to raise the height of the levee, defendant had plaintiff's officers arrested and charged with obstructing a county highway. Although plaintiff had originally built the levee, defendant contended that state law provided that any road maintained by a county for four years shall be considered dedicated to the public. Plaintiff argued that reconstruction of the levee was necessary for proper drainage and reclamation. Affirming the trial court's judgment for plaintiff, the court held that the statute providing for dedication of roads after the statutory period was not intended to divest public bodies, such as plaintiff drainage district, of rights-of-way acquired for public purposes in accordance with the law. Furthermore, the court pointed out that, while the road could be built elsewhere, the levee would be constructed in no other place. (Liptak-Fla)
W70-09087

BROWN V NORTH ST LUCIE RIVER DRAINAGE DIST (DUTY OF LANDOWNERS TO MAINTAIN LATERALS CONNECTING TO DITCH OF DRAINAGE DISTRICT).
10 So 2d 910-913 (Fla 1943).

Descriptors: *Florida, *Drainage districts, *Laterals, Easements, Ditches, Locks, Relative rights, Legal aspects, Judicial decisions, Flow control, Engineering structures, Drainage systems, Flood damage, Overflow, Local governments, Dikes, Dams, Flood control, Surface waters, Maintenance, Repairing.
Identifiers: *Injunction.

Plaintiff landowners outside defendant drainage district were granted an easement by defendant to utilize the drainage ditches of the district provided owners properly maintained the laterals which would be constructed to tie in with the ditches. A lock constructed to control the flow of water from plaintiffs' ditches was damaged so that water flowed uncontrolled into the district causing flood damage. Defendant district threatened to construct a dam to cut off all flow from plaintiffs' ditches. Even though plaintiffs agreed to repair the lock, defendant began to build a dam. Plaintiffs' sought an injunction against construction of the dam. The lower court denied the injunction. The Florida supreme court held that the original contract granting the easement controlled the rights and responsibilities of the parties. The court modified the lower court decree so that plaintiffs would be able to renew their application when they could show they were maintaining the locks, laterals and ditches so as not to cause overflow or harm to lands in the drainage district. (Hubener-Fla)
W70-09088

TROUT BROOK CO V WILLOW RIVER POWER CO (LIABILITY FOR DAM FAILURE DURING UNPRECEDENTED FLOOD).

267 NW 302-306 (Wis 1936).

Descriptors: *Wisconsin, *Dam failure, *Flood damage, *Maximum probable flood, Riparian rights, Riparian land, Water rights, Water law, Legal aspects, Judicial decisions, Damages, Remedies, Floods, Dams, Concrete dams, Earth dams, Mill dams, Flood control, Flood protection, Floodgates, Historic flood, Non-navigable waters,

Rivers, River flow, Hydroelectric plants, Trout, Ponds.

Plaintiff riparian landowner brought action against defendant power company, alleging that defendant's negligent operation of its dams during a flood caused one of the dams to break, thereby damaging plaintiff's trout ponds. Plaintiff contended that defendant was required to provide for adequate passage of water through its dams at all times to prevent injury to riparian owners, and that the dams upstream from plaintiff's ponds would not have broken had defendant opened the flood gates sooner, as plaintiff had requested. Defendant contended that the flood was unprecedented, and that he was not required to guard against such unusual occurrances. Affirming a judgment for defendant, the court held that those who obstructed the flow of a stream were not required to guard against unusual and extradordinary floods which could not be reasonably anticipated. As to plaintiff's request to open the flood gates sooner, the court noted that defendant owed duties to upper as well as to lower riparian owners to maintain the flow of the river so as to do no damage to either upper or lower riparian owners. WATER LAWS AND CONCEPTS,
Geological Survey, Washington, D.C.
Harold E. Thomas.
Available free on application to the US Geological Survey, Wash, DC 20242. US Geological Survey Circular 629, 1970. 18 p, 30 ref.

Descriptors: *Water law, *United States, *Water rights, Social aspects, Water utilization, Institutions, Governments, Legislation, Water management (Applied), Legal aspects, Water resources development.
Identifiers: U.S. Water law.

Throughout human history various laws and customs have developed concerning the individual rights and rights in common to the waters of the earth. Some laws and concepts have been carried by people in their migrations and colonial expansions to vastly different environments, with rather curious consequences. Some water laws that had been well adapted to the natural environment have become less tenable because of man's activities in modifying that environment, or because of increasing use of water. The water-rights systems in the United States vary from State to State: some are reasonably fitted to their environment, some have outlived their place in history, some are wasteful of water, some show favoritism to certain special interests or segments of the population. Water-use rights are universally recognized as real property, with constitutional protection against deprivation without due process of law. (Knapp-USGS)

CITY OF NEW YORK V WILSON AND CO (EJECTMENT ACTION BY CITY SEEKING POSSESSION OF FILLED LANDS ORIGINALLY BELOW THE HIGH WATER MARK OF RIVER).

278 N Y 86, 15 NE2d 408-416 (1938).

Descriptors: *New York, *Landfills, *High water mark, *Boundaries (Property), Land tenure, Boundary disputes, Ownership of beds, Maps, Navigable rivers, Land use, Riparian rights, Docks, Judicial decisions, Legal aspects, Cities, Prescriptive rights, Leases, Beds under water, Condemnation, Access routes, Legislation, Appropriation, Local governments, Low water mark.

The City of New York brought an ejectment action against defendant, claiming that the land defendant occupied was below the original high water mark of the East River and that all land between the original high and low water marks of the River had been granted to the city in charters dating back to colonial times. The evidence showed the land involved to have in fact been below the high water mark and to have been created by filling operations. The court held that such land was to be treated as land still under water, even after filling, and that the city still had title unless the defendant could show adverse possession. A statute passed in 1871 had made all lands under water belonging to the city inalienable. After this date, the court held, adverse possession could not run in favor of defendant. As defendant could not show adverse possession prior to 1871, the city still had title to the land and was entitled to ejectment. The defendant was, however, held entitled to access to the river, as this was a riparian right attaching to certain upland held by defendant and which had not been affected by the 1871 statute. MOHAWK CARPET MILLS, INC V NEW YORK (DAMAGES FROM FLOOD AND ICE JAM).
296 NY 609, 68 NE2d 885-886 (1946).

Descriptors: *New York, *Ice, *Ice jams, *Flood damage, Damages, Flooding, Flood protection, Ice breakup, Rivers, Ice loads, Canals, Channels, Bodies of water, Canal construction, Inland waterways, Canal design, Spoil banks, Legislation, Legal aspects, Judicial decisions, Boulders, Obstruction to flow, Alteration of flow, Natural flow doctrine, Explosives.

Plaintiff carpet mill brought action against defendant state seeking to recover for damages caused by a flood and ice jams in the Mohawk River and barge canal. Defendant had converted the river into a barge canal and in so doing had altered the channel by widening it, thereby creating spoil accumulation. An ice jam had backed up to plaintiff's property, and, when the river rose following upstream rain, the ice and flood water came onto the property, crushing a wall of the mill and doing other serious injury. Plaintiff argued that the state should have taken action, such as dynamiting the jam, in order to protect waterfront property. Defendant claimed that such jams had always freed themselves and that no action had appeared necessary to protect the property. In a per curiam decision, the New York Court of Appeals held the state liable for the damage caused by its failure to act. (Barker-Florida)

SLIDE MOUNTAIN REALTY CO V STATE (CONDEMNATION VALUE OF A WATER BODY AND DAM).
306 NYS2d 519-528 (Ct Cl 1969).

Descriptors: *New York, *Condemnation, *Condemnation value, *Eminent domain, State governments, Adjudication procedure, Easements, Judicial decisions, Land tenure, Legal aspects, Ownership of beds, Proprietary power, Relative rights, Right of way, Remedies, Dams, Ponds, Spillways, Replacement costs, Estimating.

The dispute in this case arose from a condemnation proceeding concerning an award for the replacement cost of a dam, pond and spillway located on the condemned property. The appraiser for defendant state testified that he included the amount by which the pond, dam and spillway enhanced the value of plaintiff's property in his estimate of the fair market value before condemnation. Although plaintiff's appraiser did not value the pond, dam and spillway as an independent improvement, nevertheless he included as an item for damages $49,500 over and above the value of the land alone, as a replacement cost for the pond, dam and spillway. The court found from the evidence that the estimate of defendant's appraiser was fair, and that the pond, dam and spillway did not contribute enhancement value sufficiently to warrant a separate award for the cost of their replacement. DANFORTH V UNITED STATES (CONDEMNA TION VALUE OF EASEMENT FOR FLOO CONTROL PURPOSES).
102 F2d 5-10 (8th Cir 1939).

Descriptors: *Condemnation, *Condemnatio value, *Easements, *Federal jurisdiction, Floo control, Eminent domain, Legal aspects, Compen sation, Judicial decisions, Mississippi River, Rivers Federal government, United States, Riparian land Contracts, Claims (Contract), Jurisdiction.

Pursuant to federal statute, defendant entered int a contract with the United States for an easemen of flowage rights, for flood control purposes, ove

defendant's lands. The United States repudiated the contract and brought a condemnation proceeding to obtain the easement. Defendant landowner contended that he was entitled to have his damages determined under the prior agreement. The United States contended that a federal court was limited in jurisdiction so as to be able to hear only the condemnation question and could not entertain a claim on the breach of contract. The court held that the doctrine of sovereign immunity precluded it from considering the contract claim. Thus, its only recourse was a consideration of the condemnation suit, and its determination of value of damages was to be made pursuant only to the statute authorizing such condemnation. (Snow-Florida)

UNITED STATES V MCINTIRE (OWNERSHIP OF WATER RIGHTS ON INDIAN RESERVATION).
101 F2d 650-654 (9th Cir 1939).

Descriptors: *United States, *Indian reservations, *Water utilization, *Irrigation programs, Relative rights, Water users, Water rights, Federal reservations, Public land, Legislation, Irrigation water, Beneficial use, Irrigation practices, Irrigation, Irrigation ditches, Irrigation systems, Appropriation, Prior appropriation, Priorities, Judicial decisions, Remedies, Legal aspects, Canals.

Plaintiff Indians brought suit to prohibit the acquisitions of certain water rights by defendant United States for use in an irrigation project. Plaintiffs claimed the rights through prior appropriation by their ancestor who had built an irrigation ditch on land which was part of the Indian reservation. Plaintiffs argued that such appropriation precluded interference with their right to exclusive use of the water. Defendant, who sought to construct a more complex irrigation system in the area, claimed that plaintiffs had not acquired any valid rights through their use of the water. The United States argued that the water rights in question had been reserved from the public land and that they could be transferred to a private company for the purpose of an irrigation project. The Circuit Court of Appeals, Ninth Circuit, ruled that the water rights had been reserved by federal statute and that the law protecting the use of water on public lands was not applicable. Therefore, the government could transfer the rights to the irrigation company since plaintiffs' ancestor had not acquired any exclusive rights to the water use. (Barker-Fla)
W70-09169

UNITED STATES V WALKER RIVER IRRIGATION DIST (RIGHT TO USE OF STREAM BASED ON PRIOR APPROPRIATION).
104 F2d 334-340 (9th Cir 1939).

Descriptors: *Prior appropriation, *Irrigation water, *Indian reservations, *Appropriation, Diversion, Natural flow, Water rights, Preferences (Water rights), Priorities, Riparian rights, Competing uses, Irrigation, Judicial decisions, Relative rights, Non-navigable waters, Streamflow, Streams, Federal jurisdiction, Irrigated land, Legal aspects, Flow federal reservations, Reservation doctrine.

The United States brought a suit to adjudicate relative rights in a non-navigable stream running through an Indian reservation and to restrain defendant appropriators of the waters from interfering with the natural flow of the stream. The United States, acting on behalf of the Indians on the reservation, contended that the waters of the stream had been reserved to the extent necessary to supply the reservation with irrigation water when the reservation was created. Defendants, upstream riparian landowners and appropriators of the waters, contended that they had a paramount claim to rights in the stream by virtue of the fact that they were the first to actually divert and use the stream, even though the reservation had been established a year earlier. The appellate court held that there was an implied reservation of the flow of the stream for Indian use when the reservation was created and that such reservation of the stream by the federal government exempted the waters from subsequent appropriation. Thus defendants were enjoined from interfering with the natural flow of the stream. (Snow-Fla)

BLASK V SOWL (OWNERSHIP OF ISLANDS IN NAVIGABLE WATERS).
309 F Supp 909-914 (W D Wisc 1967).

Descriptors: *Wisconsin, *Islands, *Boundary disputes, *Ownership of beds, River beds, Navigable rivers, Boundaries (Property), River flow, Accretion (Legal aspects), Reliction, Deposition (Sediments), Shores, Patents, Competition, Federal government, Water law, Riparian rights, State jurisdictions, Legal aspects, Judicial decisions, Mississippi River.
Identifiers: *Island ownership.

Plaintiff successor in interest to patentee of shorelands brought an ejectment action against the Bureau of Sport Fisheries and Wildlife of the United States Department of Interior to obtain possession of a portion of an island in the Mississippi River. Under Wisconsin law, the owner of shorelands owns all land between the shore and the thread of a river. Plaintiff, who reserved all rights to the island between the shoreland he had deeded away and the thread of the river, relied on this law in his claim to the island. The district court held that state law regarding riparian rights on navigable waters does not apply to property owned by the United States. As regards navigable waters, the rights of the state reach to the waters and soil there-under, not to islands which rise above the surface of the water. United States patents can, with the assistance of state law, convey title to river-beds, but title to islands in navigable waters remains in the United States. Therefore plaintiff did not have title to the island since such title had never been taken out of the United States. (Price-Fla)
W70-09175

UNITED STATES V ALASKA (RELATIVE RIGHTS IN SUBMERGED LAND).

423 F2d 764-768 (9th Cir 1970).

Descriptors: *Alaska, *Beds under water, *Ownership of beds, *Federal government, Lake beds, Federal-state water rights conflicts, Federal reservations, Withdrawn lands, Federal jurisdiction, State jurisdiction, Leases, Oil industry, Natural gas, Submerged Lands Act, Legislation, Wildlife conservation, Public lands, Wildlife habitats, Judicial decisions, Legal aspects.

The United States brought action to quiet title to lands under a lake in a certain Alaskan mountain range. In 1941 a presidential order made the range a wildlife refuge. In 1958 the Secretary of the Interior closed the southern half of the range to gas and oil leasing. However, in 1966 Alaska issued oil and gas leases to portions of the land beneath the lake. Defendant state and its lessees contended that under the general land laws of the United States, public lands did not include land under water. Defendants also claimed title to the land under water by application of the Submerged Lands Act. The court rejected defendants' contentions and held that the presidential order withdrawing and reserving for the Department of the Interior the disputed area of land and water was intended to include land under water, and thus the land did not pass to the state of Alaska on its admission to the Union. The general land laws of the United States and the Submerged Lands Act had no application to the disputed lands. The lands were set aside for a valid public purpose and the executive order could not be affected by Alaskan game laws. (Hubener-Florida)
W70-09242

DAVIS V CITIES SERVICE OIL CO (LIABILITY FOR DAMAGES CAUSED BY OIL POLLUTION).
420 F2d 1278-1282 (10th Cir 1970).

Descriptors: *Oil, *Water pollution sources, *Overflow, *Damages, Pollutants, Water pollution, Path of pollutants, Soil contamination, Oil industry, Oil wastes, Oily water, Weirs, Rivers, Streams, Legal aspects, Remedies, Judicial decisions, Kansas.

Plaintiff land owners and tenants brought action against various oil companies for damages allegedly caused by oil pollution. Defendants operated drilling fields and refineries along waterways that ran past plaintiffs' properties. It was contended that overflow from retention basins and seepage had entered the streams and damaged plaintiffs' property when the river overflowed its banks following rain storms. Defendants contended that the oil in question did not come from their operations, and they alleged that the source of the oil was not under their control. The trial court determined that plaintiffs' evidence was insufficient to prove liability on the part of defendants. The Court of Appeals for the Tenth Circuit ruled that such questions of fact were not reviewable and affirmed the judgment for defendants. (Barker-Florida)
W70-09243

BURAS V ELLZEY (POSSESSORY RIGHTS IN WATERFRONT PROPERTY).
233 So 2d 586-589 (La Ct App 1970).

Descriptors: *Louisiana, *Land tenure, *Real property, *Boundaries (Property), Relative rights, Navigable waters, Riparian rights, Mississippi River, Surveys, Inspection, Legal aspects, Judicial decisions, Channel morphology, Beds, Ownership of beds, Beds under water, Meanders, Geomorphology, Boundary disputes.

Plaintiffs, record title holders to certain waterfront logs, brought action against defendants for alleged possession of the lots in 'bad faith.' Plaintiffs contended that the property was above water and that defendants were wrongfully in possession. Defendants alleged that plaintiffs' lots were now under water as a result of the shifting of the river, and that they therefore could not be in possession. Conflicting expert testimony of two surveyors was introduced. The trial court then ruled that plaintiffs' lots had become part of a navigable stream, and were, in fact, under water. On appeal, the court ruled that the trial court's acceptance of one survey was not clearly erroneous, and the judgement on behalf of defendants was affirmed. (Barker-Florida)
W70-09323

BLISS V KINSEY (EXTENSION OF BOUNDARY LINES FROM MEANDER LINE TO SHORE LINE).
233 So 2d 191-194 (2d D.C.A. Fla 1970).

Descriptors: *Florida, *Boundary disputes, *Riparian lands, *Shores, Riparian rights, Boundaries (Property), Relative rights, Water rights, Equitable apportionment, Meanders, Shores, Accretion (Legal aspects), Judicial decisions, Legal aspects, Real property, Gulf of Mexico, Adjudication procedure.
Identifiers: *Meander lines.

Plaintiff and defendant were adjoining land owners. The title description fixed the boundary of both lots on a meander line of the Gulf of Mexico. There was a strip of land between the meander line and the shore line to which the government had not retained title. The question was how to extend the boundary between the lots to the shore line. The lower court held that the boundary would be drawn and the land apportioned in the manner it would have been if the land between the meander line and the shore line had been created by accretion. The line was extended so as to provide each lot with the

same relative amount of shore line as it had on the meander line in the original survey. In affirming, the court recognized that although meander lines are not treated as boundaries, courts should at least approximate the amount of shore line as indicated on a meander line when called upon to establish actual boundaries. Where riparian rights are to be extended to the shore, all of the circumstances of the case should be considered. (Price-Florida)
W70-09343

BRANT LAKE SHORES, INC V BARTON (ADVERSE POSSESSION OF LAND BELOW THE HIGH WATER MARK).

307 NYS2d 1005-1014 (Sup Ct 1970).

Descriptors: *New York, *Boundary disputes, *Ownership of beds, *Lake shores, Boundaries (Property), Easements, Leases, Legal aspects, Recreation, Relative rights, Riparian land, Riparian rights, Riparian water, Usufructuary right, Water rights, High water mark, Water level fluctuations, Watercourses (Legal), Low water mark, Beaches, Boating, Camping, Lakes, Lake beds, Recreational facilities, Judicial decisions, Prescriptive rights.

Plaintiff owned land adjacent to a lake, and claimed that, according to his deed, the boundaries of the property ran to the center of the lake. Defendant claimed that plaintiff owned only to the high water mark. An early deed in plaintiff's chain of title had set the lakeside boundary of plaintiff's lot at the high water mark. The next deed in the chain of title, however, and all deeds succeeding it, including plaintiff's, described the lakeside boundary of the lot as the low water mark. Plaintiff and his predecessors in title had openly and continuously used the beach and the waters of the lake, for commercial purposes in the form of boat rentals and camper's privileges, for over 40 years. The court held that a deed in a chain of title setting the boundary of lakeside property at the high water mark clouds any title claimed by the owner to the center of the lake. Only a boundary description set at the low water mark passes title to the center of the lake. In this case, however, plaintiff's use and possession of the waters of the lake and the beaches, unrebutted by the owners of the lake rights, constituted acquisition of title, by adverse possession, to the center of the lake. (Clarke-Florida)

CHAPTER 2: INSTITUTE FOR ANALYTICAL STUDIES.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

In: Institutions for Effective Management of the Environment, Washington, D.C. National Academy of Sciences - National Academy of Engineering, January 1970, p 17-28.

Descriptors: *Enviroment, *Management, *Planning, Institutions, Administration.
Identifiers: *Public policy, Early-warning capability, Interdisciplinary studies, Institute for Analytical Studies.

Of several institutions believed necessary to cope with the environment, one of the most important would be designed to: (1) Do the long-range planning necessary for restoring and protecting the quality of the environment; (2) Provide early warning of potential threats to the environment; (3) Conduct rapid analytic studies in response to emergencies, and; (4) Produce rapid field analysis. A number of considerations are suggested as necessary for a viable and effective institute for analytical studies: (1) Independence from the influence of any government agency or special interest; (2) Public availability of all studies, (3)Confidence of clients and the public in the integrity and independence of the institute, (4) Comprehensive representation of relevant disciplines, (5) A highly talented and dedicated professional staff, (6) A group of experienced public-policy specialists and, on an ad hoc basis, consultation with administrators and elected officials; and (7) A policy of recruiting young people for positions of responsibility and influence. (See also W70-08929) (Davis-Chicago)

CHAPTER 5: NATIONAL LABORATORY FOR ENVIRONMENTAL SCIENCE.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

Washington, D.C., National Academy of Sciences - National Academy of Engineering, January 1970. p 43-48.

Descriptors: *Environment, *Research and Development, *Research facilities, Forecasting, Management, Institutions.
Identifiers: *National Laboratory for Environmental Science, Environmental crisis, Quick-reaction field studies.

It is recommended that a National Laboratory for Environmental Science be established. This National Laboratory for Environmental Science should be responsible for basic and applied research with the following objectives: (1) Analysis of the interaction of environmental factors, leading to; (2) Development of the capacity to predict environmental changes, and thus; (3) Development of the capability to maintain, modify, restore, improve, and generally manage the environment. An additional function of the laboratory will be to have the capability to carry out quick-reaction field studies pertinent to an environmental crisis. (See also W70-08929) (Davis-Chicago)
W70-09443

CHAPTER 6: FEDERAL ORGANIZATION FOR MANAGING THE ENVIRONMENT.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

Washington, D.C., National Academy of Sciences - National Academy of Engineering, January 1970, p 49-57.

Descriptors: *Environment, *Management, *Institutions, Inter-agency cooperation, Institutional constraints, Planning, Administration, Legislation.
Identifiers: *Board of environmental affairs, Environmental quality council, Policy.

It is felt that the Environmental Quality Council, a group of highest-level government officials supported by a part-time staff is an inadequate response to the problem of developing mechanisms for effective environmental management. The problem of reorganization of executive and congressional activities into a more closely coordinated effort are reviewed. It is recommended that reorganization should come about only after sophisticated management analysis, coupled with a realistic assessment of Executive-Congressional relationships. It is recommended that a Board of Environmental Affairs within the Office of the President be established. This Board should recommend and assist the President in formulating policies; evaluate programs and activities of departments and agencies and consider how they will affect the environment; analyze, interpret, and provide assistance in generating needed data concerning environmental matters; serve as a coordinator on a working level for interdepartmental activities relating to the environment; and assist state and local governments in dealing with environmental problems. Differences between the Board and the existing Environmental Quality Council are summarized. (See also W70-08929) (Davis-Chicago)

IN RE CITY OF NEW YORK (RIGHTS O OWNERS OF BEDS SUBSERVIENT T UPLAND OWNER'S RIPARIAN RIGHTS).

158 Misc 684, 286 NYS 131-136 (Sup Ct 1936).

Descriptors: *New York, *Riparian rights, *Be under water, *Easements, Cities, Damage Remedies, Condemnation, Compensatio Eminent domain, Underwater, Land, Judicial dec sions, Riparian waters, Riparian land, Reasonab use, Competing uses, Relative rights, Island Ownership of beds, Usufructuary right, Lar tenure.

Defendant city brought condemnation proceedin to acquire plaintiff's underwater lands, whic abutted on an island owned by defendant. The underwater lots had been partitioned by cou decree and were distributed to plaintiff's predece sors in title. Plaintiff, therefore, contended that h underwater lands were not subject to the ripari rights of defendant upland owner. Moreover, plai tiff maintained that where underwater lands mig ordinarily be subject to an easement of the abuttin upland owner, there was no easement in this situ tion by reason of the court decree of partitio which destroyed any easement or rights of defe dant to these underwater lots. Defendant claime that the law of the state was that an upland own may not be prevented from exercising his ripari rights to the waters, and lands under such wate adjacent to such upland. The court held that plai tiff's underwater lands, no matter how partitione were subject to defendant's riparian rights an easement. However, the court also noted that th existence of such easement did not deprive plainti of the right to damages which resulted from defe dant's interference with the reasonable use b plaintiff of his lands. UNITED STATES EX REL TVA V POWELSO (CONDEMNATION VALUATION).
319 US 266, 63 S Ct 1047-1061 (1943).

Descriptors: *United States, *Tennessee Valle Authority Project, *Condemnation valu *Eminent domain, Hydroelectric plants, Dam Streams, Legislation, Condemnation, Judicial dec sions, Legal aspects, Damages, Non-navigabl waters, Land use, Market value, North Carolin Relative rights, Compensation, Hydroelectri power, Evaluation, Land tenure, Land develop ment, Administrative agencies, Public utilities.

Plaintiff private power company, which had bee granted the power of eminent domain by Nort Carolina, had its land condemned for a TVA pro ject. Plaintiff sought to place a very high value o the property, arguing that it could be combine with adjoining property condemnable by the com pany to form a large hydroelectric project. Th court rejected this contention because the con demnee's eminent domain power had not been ex ercised and was revocable by the state at any time The chance of the condemnee being able to com bine the necessary land to construct the hydroelec tric project was considered too remote to affect th valuation of the land. The court held that th United States, in the absence of a specific statutor requirement, was not required to make compensa tion for the loss of a business opportunity based o the unexercised privilege to use the power o eminent domain. COLORADO V KANSAS (APPORTIONMEN OF WATER BETWEEN UPRIVER AN DOWNRIVER STATES).
320 US 383, 65 S Ct 176-184 (1943).

Descriptors: *Kansas, *Colorado, *Interstat rivers, *Equitable apportionment, Natural flo doctrine, Riparian rights, Water utilization, Com peting uses, Relative rights, Diversion, Reasonabl use, Legal aspects, Judicial decisions, Water right

/ater allocation (Policy), Water contracts, Irriga-
on, Beneficial uses, Water demand, Gradually
ried flow, Irrigation water, Flow measurement.

ansas had for some time claimed that Colorado
d appropriated so much water from the Arkansas
iver for irrigation in Colorado that severe injury
as caused to downstream Kansas property. In an
rlier action between the same parties, the
preme Court had denied Kansas' contention that
was entitled to have the river flow as it did in its
tural state. In that case, it was held that Colorado
as not unreasonably diverting water from the
ver, and that any injury to Kansas property must
e weighed against the benefits of irrigation to the
ea as a whole. In the instant case, Kansas argued
at the use of the water in Colorado had increased
such an extent that the diversion unreasonably
jured Kansas riparian land. The Court rejected
is contention, reaffirming its holding in the earli-
case, finding insufficient evidence of any drastic
crease in Colorado water utilization. A recom-
ended ruling by a special master, which would
ve awarded five-sixths of the water by acre-feet
Colorado and one-sixth to Kansas, was rejected.
e Court held that the balance of interests had
en struck in favor of Colorado in the previous
se, and no reason for overturning that ruling had
en presented. (Caldwell-Florida)

asin transfers, Irrigation, Return flow, Reservoirs,
rought, Water storage.
entifiers: *Apportionment.

he North Platte River, a non-navigable stream,
iginated in Colorado, flowed through Wyoming
d Nebraska and emptied into the Missouri River
ear the Iowa border. A controversy arose con-
rning the use of the waters of the river for irriga-
on purposes. Nebraska claimed that the other two
ates were violating the rule of priority of ap-
opriation in force in all three states, thereby
priving Nebraska of water to which it was
quitably entitled. The Supreme Court adopted
bstantially the findings of the special master. The
neral holdings of the Court were: (1) the Desert
and Act made a non-navigable water supply on
ublic land free for private appropriation and
parate from the land itself; (2) where several
ates recognizing the rule of prior appropriation
e served by an interstate river, the rule of prior
propriation primarily will govern their relative
ghts as to the allocation of the water of the river,
d such allocation must be based on the dependa-
e flow, not the long-time average flow of the
ver; and (3) in such a situation, the court will al-
cate only the natural flow, not storage water,
hich is defined as water released from reservoirs;
ch storage water, however, may be considered in
quitably apportioning the natural flow among the
ates involved. (Clarke-Florida)

EARD'S ERIE BASIN V NEW YORK (RIGHTS O COMPENSATION AWARD BASED ON WNERSHIP OF LANDS CONDEMNED).

42 F2d 487-491 (2d Cir 1944).

escriptors: *New York, *Condemnation, *Com-
ensation, *Ownership of beds, Navigable waters,
minent domain, Patents, Legislation, Grants,
tate governments, Riparian waters, Judicial deci-
sions, Legal aspects, Riparian land, Land tenure, Land use, Federal government, Landfills, Land forming, Relative rights.

The United States condemned certain land, part of which was under navigable waters. A dispute arose between plaintiff and defendant state as to their respective rights in the resulting condemnation award. Plaintiff contended it owned in fee all the land condemned by virtue of letters patent and legislative grants. Defendant contended that said documents were invalid, or in the alternative, if valid, that a possibility of reverter remained in the state so as to entitle it to a share of the award. The court held that plaintiff's grants and patents were valid, that under New York law the state was empowered to alienate lands under navigable waters to private parties and that once the conditions in the grants were met by the grantee the possibility of reverter in the state disappeared. Plaintiff was held to be the owner in fee simple of all the condemned land, and to be entitled to the full condemnation award. (Price-Florida)

UNITED STATES V OTLEY (OWNERSHIP OF LAKE BEDS).
127 F2d 988-1001 (9th Cir 1942).

Descriptors: *United States, *Boundary disputes, *Ownership of beds, *Meanders, Reservation doctrine, Oregon, Boundaries (Property), Federal government, Judicial decisions, Legal aspects, Land tenure, Proprietary power, Relative rights, Riparian land, Riparian rights, Watercourses (Legal), Lakes, Lake beds, Lake shores, Surveys, Real property.

By executive order, a non-navigable lake in Oregon was officially reserved as a federal sanctuary for migratory birds. Subsequent thereto the lake was surveyed and meandered by the General Land Office. Plaintiff United States then patented to defendants the fractional lots surrounding the lake. The official plat of said lands, as determined by the survey, was incorporated in the patents. Plaintiff sued to quiet title to the lake bed, contending that the meander line represented merely the boundary of defendants' upland, not the true shoreline of the lake, since the high water mark of the lake fluctuated so greatly. Defendants claimed title to the center of the lake as riparian landowners bordering a nonnavigable waterbody. The court held that where the amount of land between the surveyed meander line and the actual shore of the lake greatly exceeds the total area described in a patent to said land, the meander will not be considered that of the lake but a mere irregular boundary of the upland. A patent to such land would not transfer any title to land under the lake. In such a case, however, the heavy burden of proof is on the plaintiff to show that the meander line is not the approximate boundary of the lake, and here the United States failed to sustain that burden. CARTER OIL CO V DELWORTH (LESSEE OF LAND ABUTTING CREEK HAS RIGHT TO CREEK BED).
120 F2d 589-591 (7th Cir 1941).

Descriptors: *Illinois, *Streambeds, *Leases, *Drilling, Streams, Grants, Oil industry, Legal aspects, Judicial decisions, Real property, Land, Natural resources, Oil fields, Boundaries (Property), Rivers, Ownership of beds, State governments, State jurisdiction, Federal jurisdiction, Beds, River beds, Remedies, Relative rights.
Identifiers: *Exclusive rights.

Plaintiff oil company's lessor was conveyed land abutting a creek. Subsequently, the same grantor leased the adjoining creek bed to defendants' assignor. These lands were acquired by plaintiff and defendants for the purpose of drilling for oil. Plaintiff brought suit to enjoin defendants' drilling in the creek bed, claiming the lease to the land abutting the creek entitled him to the exclusive right to drill the creek bed. Defendant contended that plaintiff's lease to the land bordering the creek did not include any rights to the creek bed. The court stated that, under state law, a grant of land bordering a creek or river gives the exclusive right and title to the center of the stream to the grantee, unless the grantor intended to reserve rights to the creek bed. The court did not read into plaintiff's lessor's deed any intended reservation of title to the creek bed, nor did the court find a reservation implied by the actions of the grantor. Therefore, in holding for plaintiff, the court recognized the rule that where there is no evidence of a contrary intent, the title to land bordering a stream extends to the center of such stream. (Finman-Florida)

BERGER V OHLSON (NO ABSOLUTE RIGHT TO TOLL FREE USE OF GOVERNMENT CONTROLLED DOCK).

120 F2d 56-60 (9th Cir 1941).

Descriptors: *Alaska, *Docks, *Payment, *Cities, Ships, Harbors, Railroads, Federal government, Federal jurisdiction, Public benefits, Construction, Judicial decisions, Legal aspects, Permits, Control, Royalties, Regulation, Standards, Land tenure, Relative rights, Use rates.
Identifiers: Tideland.

Plaintiff shipping company unloaded its large cargo ships by use of lighters or barges, which, in turn, carried the cargo to a city dock. Defendant railroad, which was owned and operated by the federal government, objected to plaintiff's lightering its cargo to the city dock since plaintiff was able to avoid wharfage fees exacted for the use of defendant's dock. Therefore, in an effort to overcome plaintiff's competition, defendant demanded the payment of wharfage fees for plaintiff's use of the city dock. Plaintiff sought to enjoin defendant's demand of wharfage fees and interference with his use of the city dock. Plaintiff contended that the city owned the dock and that he was therefore privileged to use such dock as a member of the public without the payment of wharfage fees. Defendant maintained that even though the city had built the dock, it was constructed on upland and tideland owned by the federal government, and was therefore subject to defendant's control. The court held that plaintiff had a mere license to the use of the city dock, and that defendant exercised its lawful authority by exacting a wharfage fee. (Finman-Florida)

BROOKS V UNITED STATES (JURISDICTION OF FEDERAL COURT TO DETERMINE WATER RIGHTS IN INTERSTATE RIVER).

119 F2d 636-647 (9th Cir 1941).

Descriptors: *Federal jurisdiction, *Jurisdiction, *Interstate rivers, *Water users, Operating costs,

Federal governments, United States, Arizona, New Mexico, Water supply, Water rights, Water management (Applied), Water distribution (Applied), Rivers, Water delivery, Water costs, Water control, Water allocation (Policy), Upstream, Remedies, Distribution systems, Legal aspects, Judicial decisions, Appropriation, River flow.
Identifiers: *Contempt (Legal aspects).

Defendant upper water users, residents of New Mexico, were parties to proceedings brought by the United States in the federal district court of Arizona, which determined the rights of all water users to the waters of an interstate river which originated in New Mexico and flowed through Arizona. Defendants subsequently appropriated more water from the river than they were entitled to under the terms of the court's decree. In addition, defendants failed to pay their fair share of the operating costs of the distribution system set up by such decree. Therefore, plaintiff brought contempt proceedings against defendants for committing such acts in violation of the court decree. Defendants contended the court in Arizona did not have jurisdiction to determine the rights of water users in New Mexico, as a suit to adjudicate water rights was a local action. The court held defendants guilty of contempt, and stated that the Arizona court had jurisdiction to determine the rights of the upper water users in New Mexico to the interstate river insofar as such determination was directly related to the rights of the water users in Arizona. (Finman-Florida)
W70-09470

ALBION-IDAHO LAND CO V NAF IRRIGATION CO (PRORATION OF WATER RIGHTS UNDER PRIOR APPROPRIATION DOCTRINE).

97 F2d 439-445 (10th Cir 1938).

Descriptors: *Prior appropriation, *Priorities, *Proration, *Preferences (Water rights), Adjudication procedure, Judicial decisions, Jurisdiction, Federal jurisdiction, State jurisdiction, Streamflow, Streams, Non-navigable waters, Water rights, Appropriation, Beneficial use, Diversion, Legal aspects, Water law, Reasonable use, Remedies, Water allocation (Policy), Water loss, Intermittent streams.
Identifiers: Injunction (Prohibitory).

Plaintiff lower landowners in Idaho sought an injunction restraining defendant upstream landowners in Utah from diverting water from an interstate non-navigable stream. On appeal from a judgment for defendants, plaintiffs, relying on prior decrees adjudicating their water rights, contended that the trial court had failed to apply the prior appropriation doctrine and had substituted a fair distribution of the water instead. Defendants asserted their own priorities in the beneficial use of the water and argued that a strict application of the prior appropriation rule resulted in waste when the streamflow was so diminished that the water would not reach the downstream prior appropriator in useful quantities. The court noted that prior appropriation applies to interstate streams where, as here, both states recognize the rule. As to the prior decrees, the court held that local actions to adjudicate water rights do not bind strangers to the judgment and do not determine water rights in another jurisdiction. The court then held that when, due to seepage, evaporation and other physical conditions, the water did not reach the prior appropriator in useful quantities, the junior appropriator was entitled to divert the water, thereby recognizing the priorities of the users, avoiding waste and making the best utilization of the water. (Liptak-Florida)
W70-09474

HOLYOKE WATER POWER CO V AM WRITING PAPER CO (USE OF WATER POWER BEYOND SCOPE OF GRANT).

94 F2d 933-934 (1st Cir 1938).

Descriptors: *Massachusetts, *Electric power, *Water supply, *Water utilization, Water users, Mills, Grants, Electric power production, Electric generators, Water wheels, Non-consumptive use, Reasonable use, Transmission (Electrical), Industrial water, Industrial plants, Judicial decisions, Legal aspects.
Identifiers: *Mill power.

Plaintiff water power company brought action to prevent defendant paper company's transfer of electric power from its mill sites to other locations. Defendant, as owner or lessee of certain mill sites whose water was supplied by plaintiff, had constructed electric generators on the sites which were powered by water wheels. The electric power created was transferred to other sites owned by defendant. Plaintiff argued that the original grant of the water supply restricted the use of the mill power to the specific site, and that defendant's operations were in violation of the grant. The First Circuit Court of Appeals ruled that the mill power was in fact being used on the specific sites, and that defendant's conversion of the mill power to electric current was not an improper use of the mill power within the meaning of the grant. The suit was dismissed. (Barker-Florida)
W70-09475

CONTINENTAL LAND CO V UNITED STATES (CONDEMNATION VALUE OF LANDS TO BE FLOODED BY A DAM).

88 F2d 104-111 (9th Cir 1937).

Descriptors: *Damsites, *Dams, *Backwater, *Condemnation value, Sites, Engineering structures, Grand Coulee Dam, Reservoirs, Condemnation, Eminent domain, Legal aspects, Judicial decisions, Federal government, United States, Riparian rights, Rivers, Navigable rivers, Navigation, Rivers and Harbors Act, Legislation, Riparian land, Property values, Compensation.

In proceedings by plaintiff United States to determine compensation for the taking of land bordering a navigable river, defendant riparian landowners contended that they were entitled to an additional compensation for their land which was to be flooded by the backwaters of a dam to be constructed by plaintiff. Defendants' claim for additional compensation was based upon their contention that the land area involved was the only suitable location for the dam. Consequently, they argued that the inherent adaptability of the uplands up a special use in the development of electrical power increased its value over the reasonable market value. The government contended that defendants' compensation was limited to the reasonable market value of the property taken. The court held that the government's absolute power to improve navigation by building the dam precluded private landowners from having any property right in the special use of the navigable waters or power inherent therein. Thus defendants were limited to the reasonable market value of the lands taken. (Snow-Florida)
W70-09477

MIAMI BEACH JOCKEY CLUB, INC V DERN (GOVERNMENT CONTROL OVER OBSTRUCTIONS TO NAVIGATION).
86 F2d 135-136 (DC Cir 1936).

Descriptors: *Navigation, *Navigable waters, *Permits, *Administrative agencies, Relative rights, Judicial decisions, Legislation, Federal government, Landfills, Land forming, Eminent domain, Condemnation, Beds, Compensation, Administrative decisions, Regulation, Legal aspects, Supervisory control (Power), Beds under water.
Identifiers: Obstruction to navigation.

Plaintiff jockey club, having been previously granted a permit by defendant Secretary of War authorizing the filling in of submerged lands in navigable waters, brought this action to enjoin defendant from revoking such permit. Plaintiff contended that such revocation would amount to a tak ing of property without compensation and that th congressional act under which defendant was ac ing in revoking the permit, which conferred upo the Secretary of War the power to determi whether or not a proposed structure was an ob struction to navigation, was an unconstitution delegation of legislative power. In a per curia decision, the court rejected both contentions an held that the permit granted to improve the lands question was revocable by defendant without com pensation. Navigable waterways are always subje to the paramount authority of Congress in the co trol of navigation. (Snow-Florida)
W70-09478

ICKES V FOX (PROTECTION OF PRIVATE AP PROPRIATION RIGHTS IN A FEDERA RECLAMATION PROJECT).

85 F2d 294-299 (DC Cir 1936).

Descriptors: *Federal reclamation law, *Ap propriation, *Preferences (Water rights), *Wate allocation (Policy), Federal government, Unite States, Legal aspects, Water law, Beneficial use, I rigation water, Priorities, Judicial decisions, Adju dication procedure, Claims (Contract), Contrac administration, Regulation, Water rights, Wate contracts, Water requiremtns, Water distributio (Applied), Irrigation programs.

Plaintiff landowners brought action to restrain de fendant Secretary of the Interior from divertin water into a reservoir for a federal reclamation pro ject, thereby limiting plaintiff's water rights. Plain tiffs acquired their appropriation rights from th government's predecessor, an irrigation company and contended that the amount of water supplie for beneficial use at that time, and for twenty yea thereafter, was fixed by contract and could not b diminished. Defendant contended that the sui being against the United States, could not be main tained and that defendant had the authority to limi plaintiffs' water rights since the water was necessa ry to maintain the reservoir. After holding that th suit was allowable as against an agent of th government rather than the government itself, th court found that the Federal Reclamation Act an state law both measured appropriation rights by th amount of water necessary to irrigate the land, an not by the mere diversion and storage of the wate Therefore , the court held that the property right in the water were plaintiffs' rather than the federa government's and were appurtenant to plaintiffs land. The court affirmed the order denying defen dant's motion to dismiss. One justice dissented (Liptak-Florida)
W70-09479

KARLSON V UNITED STATES (CONDEMNA TION OF FLOWAGE EASEMENT OVE RIPARIANS'S LANDS).
82 F2d 330-337 (8th Cir 1936).

Descriptors: *Eminent domain, *Water level fluc tuations, *Easements, *Condemnation value, Con demnation, Legal asepcts, High water mark, Low water mark, Variability, Elevation, Lakes, Relative rights, Judicial decisions, Treaties, Federal Govern ment, Dams, Flow control, Flooding, Property values, Compensation, United States, Beneficia use.

In a condemnation proceeding to obtain flowage easements upon lands bordering a lake, which wa to be regulated in such a manner as to intermit tently raise the water level above the natural high water mark so as to flood defendants' riparian lands, defendants contended that the land to be condemned would have no market value as a result of the intermittent flooding, and sought compensa tion in the amount of such lands' full present mar ket value. The federal government contended that it was obtaining only an easement and not a free title to the land, and that the land could be put to beneficial use when not flooded. Consequently,

ompensation at the present full market value was ot required. The court held that where less than a ee interest is taken and where substantial enjoy- ient of the land remains in the owners, compensa- on is not required at a rate as if the whole proper- was taken. Inasmuch as it is a question for the ry to determine the value of the interest actually ken, the jury verdict granting defendants com- ensation at a rate less than the market value of the e simple title was sustained. (Snow-Florida)

lentifiers: *Water mains.

laintiff landowners brought actions against defen- ant city to recover damages resulting from defen- ant's construction of sewers and water mains cross plaintiffs' property. Plaintiffs had tendered eeds to 18 foot strips of their land to the city to be sed for streets and alleys, but defendant con- ructed the sewers and water mains before acquir- g title to all of the property needed for the lanned streets. Plaintiff contended that the condi- on attached to the deliverty of the deeds, acquisi- on of all the necessary property, was not per- ormed. Therefore, plaintiffs contended that defen- ant had taken their property and was liable for the arket value of the land taken. Defendant con- nded that the preparation of maps did not con- itute a taking of property, and that the measure amage for injury to the land caused by the sewers nd water mains was the depreciation in the value f the land. Reversing a judgment for plaintiffs, the ourt held that, although defendant was without gal title to the property and had imposed an un- wful servitude upon the land, the proper measure f damages was the depreciation in the value of the roperty rather than the land's market value. (Lip- ak-Florida)

ERIE LACKAWANNA RY V SILLS (SUNKEN VESSEL OBSTRUCTING DOCKS AS TRESPASS).

307 NYS2d 803-804 (Sup Ct 1970).

Descriptors: *New York, *Navigation, *Harbors, *Remedies, Federal jurisdiction, Navigable waters, Ships, Transportation, Docks, Legislation, Admiralty, Legal aspects, Law of the sea, Judicial decisions, Federal government, Boats, Barriers, Relative rights, Hazards, Jurisdiction, Damages, Piers.
Identifiers: *Wreck Act.

Defendant was the owner of a barge which had sunk in a certain harbor. The barge obstructed access to plaintiff's docks. Plaintiff brought action under the federal Wreck Act charging defendant with an unlawful trespass by having abandoned the sunken barge. Defendant contended the Wreck Act did not apply to him since he had abandoned the barge in the navigable waters of the harbor. The court held that the rights and duties of the parties were governed by federal maritime law and that plaintiff's complaint was sufficient to sustain a cause of action based on the Wreck Act. The Wreck Act, although penal, would support civil actions by private parties against owners of vessels negligently or willfully sunk in navigable waters. It was only necessary that the plaintiff be within the class of persons Congress intended to protect and the harm the type Congress intended to forestall. Both damages and injunctive relief were available under the Act. (Hubener-Florida)

FLOOD PLAIN MANAGEMENT - IOWA'S EXPERIENCE.
Iowa State Univ., Ames. Dept. of Civil Engineering.

Papers presented at Conference on Flood Plain Management, 6th Water Resources Design Conference, Jan 23-25, 1968, Iowa State University; Merwin D. Dougal, editor, published by Iowa State University Press, Ames, 1969. 270 p.

Descriptors: *Flood protection, *Non-structural alternatives, *Iowa, Flood plain zoning, Land use, Land management, Mapping, Data collections, Planning, Regulation, Flood plain insurance, Floodways, River basin development, Urbanization.
Identifiers: Flood plain management.

Comprehensive planning of flood plains is a clear prerequisite to successful control and regulatory phases of flood plain management. This seven-part volume brings together in one integrated text the available information concerning the many phases of flood plain management. Part I presents the philosophy and need for flood plain management. Part II presents the physical flood problem and the future flood potential in Iowa. Part III is devoted to the development of action programs for flood plain management. Part IV deals with the planning role and its many facets. Part V presents the legal aspects of flood plain management. Part VI is devoted to technical flood plain information studies. Part VII contains two reports on the success of management programs in other states. (See also W70-09254 and W70-09255). (Knapp-USGS)

FLOOD PLAIN MAPPING BY THE U. S. GEOLOGICAL SURVEY,
Geological Survey, Champaign, Ill.
D. W. Ellis.
In: Flood Plain Management - Iowa's Experience, Papers presented at Conference on Flood Plain Management, 6th Water Resources Design Conference, Jan 23-25, 1968, Iowa State University; published by Iowa State University Press, Ames, p 197-206, 1969. 10 p, 15 ref.

Descriptors: *Floods, *Mapping, *Iowa, *United States, Maps, Flood protection, Warning systems, Data collections, Hydrologic data, Frequency analysis, Stage-discharge relations, Water levels, Profiles, Planning, Flood plain zoning, Flood control, Non-structural alternatives.
Identifiers: USGS Hydrological Atlases.

Effective flood plain management requires a knowledge of the magnitude and frequency of floods to be expected and of the areas that will be inundated. The series of flood inundation reports (hydrologic atlases) of the USGS are intended to aid individuals and agencies responsible for making planning decisions by providing this needed hydrologic data. Components of the reports are the topographic map, a history of past floods, a flood frequency diagram, flood profiles, an oblique aerial photograph taken during the flood, and a brief explanatory text. The flood atlases present hydrologic data concerning the extent, depth, and frequency of flooding that are essential for an appraisal of hazards involved in development of flood plains. The atlases are useful in establishing programs of flood plain management, preparing building and zoning regulations, locating waste disposal facilities, purchasing open space, developing recreational areas, and managing surface water in relation to groundwater resources. NATIONAL INSTITUTE OF ECOLOGY: AN INQUIRY, VOLUMES 1 AND 2.
Ecological Society of America, Durham, N.C., and Peat, Marwick, Mitchell and Co.

Ecological Society of America Feasibility Study Report, March 25, 1970. 77 p, 2 fig, 17 tab. NSF Grant GB-6890-001.

Descriptors: *Ecology, *Institutions, Administrative agencies, Administration, Universities, Governments, Political aspects, Legal aspects, Research and development.
Identifiers: National Institute of Ecology (Proposed).

This study was made to determine whether the establishment of a National Institute of Ecology can enhance the level of ecological capability relative to that obtainable through the allocation of comparable resources to currently established organizations. It is proposed that the results of this study show that such an institute is both needed and feasible. In response to the expressed desires of many people in varied interest groups, the establishment of a National Institute of Ecology could provide a focus for the concentration of ecological activity. Its establishment could create the supportive and administrative vehicle for the continuation of the U. S. International Biological Program. It could provide manpower, facilities, and organization. It could provide direct and needed assistance to research and educational programs. It could serve as a national center for the storage and coordinated use of the data of ecology, help to standarize data collection and interpretation techniques, and, in general, make those data and techniques of maximum benefit to science and society. (Knapp-USGS)

6G. Ecologic Impact of Water Development

ELECTRIC POWER - IMPACT ON THE ENVIRONMENT,
California Public Utilities Commission.
For primary bibliographic entry see Field 06B.
W70-09020

MAJOR ELECTRIC POWER FACILITIES AND THE ENVIRONMENT,
Edison Electric Inst., N.Y.
Robert N. Coe.
Amer Power Conf, Chicago, Ill, Apr 1970. 17 p.

Descriptors: Aesthetics, *Environment, Project planning, Safety, *Electric power, Electric power demand, Electric power production, Air pollution, Sites, *Reliability, Economics, Switchyards (Electrical), Transmission lines, Substations (Electrical), Transmission towers, Powerplant, Locations, Recreation facilities, Planning, *Public opinion.
Identifiers: Living standards, Pollution control, Beautification.

Environmental problems of the utility industry, accompanied by regulatory and court delays that are inhibiting reliability standards in some areas, are considered and solutions presented. Electric power requirements of the nation have doubled every 10 yr. The future indicates a continued growth as the standard of living improves. Planning and installing major electric power facilities needed to meet this growth require full consideration of environmental factors. Growth in facilities must be accomplished on a timely and orderly basis if an adequate and reliable electric power supply is to continue. Major electric power facilities include generating stations, transmission lines, large substations, and switching centers. Problems associated with building these facilities are: (1) engineering and physical, (2) environmental, and (3) economic. Electric utilities should make all reasonable efforts to enhance the scenic and aesthetic values of project areas. Personnel responsible for location, design, construction, and operation of facilities should be sensitive to their environmental responsibilities and to their responsibility for providing adequate, economic, and reliable electric service. (USBR)

ENVIRONMENTAL CHANGES PRODUCED BY COLD-WATER OUTLETS FROM THREE ARKANSAS RESERVOIRS,
Arkansas Univ., Fayetteville. Water Resources Research Center.
Carl E. Hoffman, and Raj V. Kilambi.
Available from NTIS as PB-193 675, $3.00 in paper copy, $0.65 in microfiche. Arkansas Univ. Water Resources Research Center, Publication No. 5, 1970. 169 p, 10 tab, 15 fig, 65 ref, 10 append. OWRR Project A-001-ARK (8).

Descriptors: *Tailwater, *Temperature, *Current (Water), *Trout, Phytoplankton, Zooplankton, Benthic fauna, Chironomidae, Oligochaetes, Isopods, Amphipoda, Mayflies, Chrysophyta, Cyanophyta, Chlopophyta, *Fish, Cold-water fish, Arkansas, Benthos, Invertebrates.
Identifiers: Trichoptera, Buffalo River (Arkansas), Kings River (Arkansas), Chironomidae.

Water qualities of two natural streams (Buffalo and Kings Rivers), one new coldtailwater (Beaver), and two old coldtailwaters (Norfork and Bull Shoals) in northwestern Arkansas were studied from July 1965 through October 1968. The essential difference between the old coldtailwaters and natural streams is a change in water quality which allows the development of a new productive ecological environment. Features which typify the old tailwaters are as follows: (1) relatively homoiothermal temperatures; (2) stream beds scoured by strong hydroelectric power generation currents; (3) abundant phytoplankton and benthic macroinvertebrates; and (4) absence of warm water game fishes. Environmental factors characterizing natural streams are as follows: (1) high summer temperatures; (2) seasonal and individual current fluctuations at the various stations; (3) a greater variety of benthic macroinvertebrates and ichthyofauna; (4) abundant zooplankters; and (5) a tendency toward an equal distribution of the phyla Chrysophyta, Cyanophyta, and Chlorophyta. By October 1968, the new Beaver coldtailwater had lost all of its warm-water characteristics but had not developed the biotic features of the old tailwaters.

PROCEEDINGS WORKSHIP ON MOSQUITO CONTROL IN NORTH CAROLINA,.
North Carolina Water Resources Research Inst., Raleigh.

Available from NTIS as PB-193 719, $3.00 in paper copy, $0.65 in microfiche. Report No 36, Water Resources Research Institute, University of North Carolina, 1970. 144 p. OWRR Project A-999-NC (17).

Descriptors: *Mosquitoes, Aquatic insects, Public health, Aquatic habitats, Entomology, *Insect control, Insecticides, Larvicides, *Pesticides, *Water management, Drainage, Insect physical control, North Carolina.
Identifiers: Mosquito control drainage, Mosquito control impoundment.

The objectives of this workshop held on May 4, 1970 at Rangemont, North Carolina, were to explore present mosquito control practice, transition away from persistent pesticides, minimization of ecological impact, integration of mosquito control with water resource management, program coordination, and develop recommendations concerning changes in the program together with research and educational needs. Participants included representatives of federal and state agencies and electric utilities concerned with mosquito control and its implications to water resource management. This is the fourth in a series of research workshops sponsored by the Institute to increase communication between research users and researchers o water resource problems and research need (Howells-Univ. of North Carolina)
W70-09421

SCENIC RIVERS IN MARYLAND.
Maryland Dept. of State Planning, Baltimore.

Available from NTIS as PB-191 288, $3.00 i paper copy, $0.65 in microfiche. State Plannin Dept. Pub 161, Mar 70. 42 p.

Descriptors: *Wild rivers, Conservation.
Identifiers: Scenic Rivers.

The report represents the first in a series of annu findings and recommendations to the General A sembly from the Maryland Scenic Rivers Revie Board concerning the designation of Scenic Rive in Maryland. Five rivers are recommended for off cial Scenic River designation. When approve these rivers would represent the beginning of Scenic Rivers System for Maryland.

07. RESOURCES DATA

7A. Network Design

A PROPOSED STREAMFLOW DATA PRO GRAM FOR MAINE,
Geological Survey, Augusta, Maine.
G. S. Hayes, and R. A. Morrill.
U S Geological Survey Open-file report, 1970. 3 p, 2 fig, 4 tab, 6 ref, append.

Descriptors: *Data collections, *Hydrologic data *Streamflow, *Network design, *Maine, Statistica methods, Streamflow forecasting, Regression anal ysis, Stream gages, Gaging stations, Planning Discharge measurement.
Identifiers: Streamflow data.

An evaluation of the streamflow data available i Maine was made to provide guidelines for planning future programs. The basic steps in the evaluatio procedure were (1) definition of the longterm goal of the streamflow data program in quantitative form, (2) examination and analysis of all available data to determine which goals have already bee met, and (3) consideration of alternate program and techniques to meet the remaining objectives. I was found that many of the goals could be met b generalization of the data for gaged basins by regression analysis. This indicates that change could be made in the present data program tha would allow emphasis to be placed on attaining th goals that have not been met. A streamflow data program based on the guidelines developed in thi study is proposed. (Knapp-USGS)

USE OF TRACERS IN HARBOR, COASTAL AND OCEAN ENGINEERING,
Norges Tekniske Hoegskole, Trondheim.
P. Bruun.

Eng Geol, Vol 4, No 1, p 73-88, Jan 1970. 16 p, 24 fig, 1 tab, 15 ref.

Descriptors: *Tracers, *Radioisotopes, *Coastal engineering, *Harbors, *Oceans, *Oceanography, Rivers, Bibliographies, Methodology, Foreign research, Underwater construction, Reviews, Sedimentation, *Sediment transport.
Identifiers: *Radioactive tracers, *Fluorescent tracers, Norway, Steady-dilution method, Space-integration method.

Radioactive and fluorescent tracers have been used for over 10 yr, and usage is being expanded by improvement in existing fields and new applications. Use now covers a wide range of fields including harbor, ocean, coastal and river engineering, littoral drift, dredging technology, and pollution control. A history of the development of methodology for using radioactive and fluorescent tracers is outlined and examples of application are given. Radioactive and fluorescent tracers are compared. Pertinent aspects of tracer technology and methods of analyses for determining drift pattern and quantity are discussed. Underwater TV may be useful, particularly if the problem of underwater exitation of fluorescent tracers is solved. A list of literature on tracer projects in various fields of science and technology is included. Has 15 references. (USBR)

AN INSTRUMENT FOR MEASURING SOIL MOISTURE BY NEUTRON SCATTERING,
Swedish Meteorological and Hydrological Inst., Stockholm (Sweden).
Todor Milanov.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 88-95, 1968. 8 p, 6 fig, 7 ref.

Descriptors: *Soil moisture meters, *Nuclear moisture meters, *Calibrations, Moisture meters, Soil moisture, Instrumentation, Moisture content, Nuclear meters.
Identifiers: *Neutron-scatter moisture meters.

At the Swedish Meteorological and Hydrological Institute the neutron method has for some years been used for studies on soil moisture by means of a Danish apparatus. This report deals with the measuring equipment, sources of error, calibration technique, etc. The moisture probe is equipped with a 5 mC Ac-Be neutron source, combined with a scintillation crystal of Lithium Iodide as detector. The maximum error for 160 measurements made by the moisture probe in its standard was found to be about 1%, corresponding to a relative error of 0.5%. The calibration was made in moisture models, made of fine sand mixed with a substance containing crystal water. Some soil moisture measurements made in the field in a homogeneous soil are reported. (See also W70-09266). (Knapp-USGS)

THE DETERMINATION OF SOIL MOISTURE WITH THE NEUTRON SCATTERING METHOD IN FINLAND,
Finnish Hydrological Office, Helsinki.
J. Virta.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 105-108, 1968. 4 p, 3 tab, 2 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Calibrations, Mositure meters, Soil moisture, Instrumentation, Mositure content, Nuclear meters, Evapotranspiration.
Identifiers: Neutron-scatter moisture meters, Finland.

The neutron method for measurements of soil moisture has been used in Finland from the year 1964. The Hydrological Office has had two measuring sites in forest, with six or seven measuring tubes. In each tube the moisture has been determined at different depths. The measurements have been carried out once a month during the winter and twice monthly during the summer. The purpose is to determine the fluctuations of soil moisture and to examine the possibility of computing the evapotranspiration from these measurements. The results of the measurements are presented and the effects of the instability of the measuring system and the irregular areal distribution of the change of soil moisture content are discussed. (See also W70-09268). (Knapp-USGS)
W70-09267

NEUTRON MOISTURE METER FOR SALINE SOILS,
All-Union Scientific and Research Institute of Hydrotechnics and Reclamation (USSR).
L. I. Beskin, V. A. Emelyanov, and B. M. Kondratyev.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 109-112, 1968. 4 p, 3 fig.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Calibrations, Moisture meters, Soil moisture, Instrumentation, Moisture content, Nuclear meters, Gamma rays.
Identifiers: *Epithermal neutron moisture meters.

The principle of action of well-known neutron moisture meters is based on detecting thermal neutrons, which appear when rapid neutrons are being slowed down by hydrogen nuclei. However, the moisture meters with such detectors are sensible to changes in the percentage of chloride, boron, lithium and other excessively strong absorbers of neutrons, which may result in considerable errors in measuring the moisture of soils containing these elements. It is possible to reduce the action of the excessively strong absorbers by means of detection of epithermal neutrons, but this will deteriorate sensitivity of the moisture meters. Best suited for the job is the method of measuring the moisture of soils by total density of thermal neutrons and the gamma photons in a cadmium screen. The method is, under certain conditions, practically insensitive to any changes in percentage of chloride and considerably less sensitive to any changes in percentage of other excessively strong absorbers. When moisture is being measured by the moisture meter with such a detector, a single calibration may be used on all types of soils of nonorganic origin, provided the admissible absolute error is plus or minus 2%. (See also W70-09269). (Knapp-USGS)
W70-09268

MEASUREMENT OF SOIL MOISTURE FROM THE TEMPERATURE GRADIENT,
Forest Research Inst., Budapest (Hungary).
T. Foldi, and L. Szonyi.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 113-119, 1968. 7 p, 6 fig, append.

Descriptors: *Soil moisture meters, *Thermal conductivity, Instrumentation, Calibrations, Moisture meters, Soil temperature, Thermal properties, Soil moisture.
Identifiers: Temperature gradient moisture meters.

A new method for measuring soil moisture is described. Near a heat transmitter with stabilized heat flux, thermal conductivity of the soil can be determined and recorded from the temperature gradient. Using a corrosion resistant transmitter introduced into the soil and ensuring constant calibration conditions, soil moisture can be measured and recorded. For determining soil moisture a new electric method was developed, which is independent from the concentration of the soil solution, thus being suitable for measuring and recording moisture in soils of different structure. The measuring probe is weather proof, resistant to mechanical effects during installation into the soil, and to influences of temperature for extended periods. (See also W70-09269). (Knapp-USGS)
W70-09269

SOME METHODS FOR THE DETERMINATION OF SOIL MOISTURE AND BALANCE MEASURING,
Hydraulic Research Inst., Prague (Czechoslovakia).
Jiri Vasa.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International

Association of Scientific Hydrology, Publication No 82, p 119-124, 1968. 6 p, 3 fig, 1 tab, 10 ref.

Descriptors: *Soil moisture, *Measurement, *Sampling, *Electrical resistance, Soil moisture meters, Laboratory tests, On-site tests, Water balance, Hydrologic budget, Energy budget, Rain gages, Calibrations.
Identifiers: Soil moisture determination.

Methods of measuring soil moisture and water balance used in Czechoslovakia are reviewed. Sampling, electrical resistivity methods, water budget, and energy budget methods are briefly discussed. A rain gage calibration table is included to aid in estimating the proportion of gaged rain actually reaching the ground. Soil sampling equipment is described. (See aslo W70-09271). (Knapp-USGS)
W70-09270

POLISH ISOTOPE APPARATUS FOR RESEARCH ON SOIL MOISTURE,
Hanna Filipkowska.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 124-131, 1968. 8 p, 3 fig, 9 ref.

Descriptors: *Nuclear moisture meters, *Soil moisture meters, *Calibrations, Moisture meters, Soil moisture, Instrumentation, Moisture content, Nuclear meters.
Identifiers: *Poland, Soil moisture measurement, Neutron-scatter moisture meters.

Polish probes manufactured by the Bureau for the Nuclear Technique Installation which serve to measure soil moisture were described. They allow determination of the water content in the surface layer and at depth. The basic part of each probe is the source of fast neutrons and the GEIGER-MULLER counter covered with cadmium. As a source of fast neutrons the mixture Pu + Be or Po + Be has been used. To use the probes in practice one should define for each of them the dependence between the impulse intensity recorded on the scaler and the soil moisture. When the probe calibration is performed one should take into account the influence of bulk density of the ground on moisture and the eventual errors due to contents of elements which strongly absorb neutrons in the ground mixture.s. Soil moisture measurements may be performed within the range of 0-45% of volume moisture, with accuracy of 0.3-1.5, according to the manufacture data. The results obtained always refer to a sphere with a radius of 15-25 cm. (See also W70-09272) (Knapp-USGS)
W70-09271

NUCLEAR TECHNIQUES IN HYDROLOGICAL INVESTIGATIONS IN THE UNSATURATED ZONE,
International Atomic Energy Agency, Vienna (Austria). Div. of Research and Laboratories.
E. Halevy.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 131-145, 1968. 15 p, 5 ref, 2 append.

Descriptors: *Nuclear moisture meters, *Radioisotopes, *Moisture meters, *Soil moisture meters, Calibrations, Soil moisture, Soil water, Instrumentation, Moisture content, Nuclear meters, Surveys, Reviews.
Identifiers: Neutron-scatter moisture meters.

Nuclear and isotopic techniques which may aid in investigations of the unsaturated zone are discussed. The discussion includes methods for the determination of soil water content and methods for investigation of the movement of soil moisture. The recommendations of the joint FAO/IAEA conference on the Use of Isotopes and Radiation Techniques in Soil Moisture and Irrigation Studies held at Vienna in March 1966 are annexed. A list of definitions of terms relating to neutron soil moisture gages is also given. (See also W70-09273) (Knapp-USGS)
W70-09272

CALIBRATION AND EVALUATION OF A WIDE RANGE METHOD FOR MEASURING MOISTURE STRESS IN FIELD SOIL SAMPLES,
Geological Survey, Denver, Colo. Water Resources Div.
I. S. McQueen, and R. F. Miller.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 147-155, 1968. 9 p, 2 fig, 2 tab, 16 ref.

Descriptors: *Moisture stress, *Soil moisture meters, Soil moisture, Calibrations, Instrumentation, Laboratory tests, On-site tests, Membrane processes, Osmosis, Membranes.
Identifiers: Moisture stress meter.

A moisture stress measurement for each gravimetric soil moisture sample, made possible by development of a wide-range method using filter paper as stress sensors, is supplying answers to some difficult hydrologic problems. The moisture stress existing in a gravimetric sample can be measured within 2 percent and the range covered is from 0 to 1500 bars. Calibration of the method was accomplished in the laboratory and in the field using saturated salt solutions (15 to 1500 bars), a pressure membrane extractor (1 to 15 bars), a pressure plate assembly (0.1 to 1 bars), and equilibrium above a water table (0 to 0.2 bars). Disturbance of the sample has little effect on results at stress levels above 0.2 bars. At stress levels below 0.2 bars, special handling and sampling techniques should be used to obtain samples with minimum disturbance. (See also W70-09274) (Knapp-USGS)
W70-09273

HYDRAULIC AND PRESSURE HEAD MEASUREMENT WITH STRAIN GAUGE PRESSURE TRANSDUCERS,
Illinois Univ., Urbana; and Agricultural Research Service, Urbana.
A. Klute, and D. B. Peters.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 156-165, 1968. 10 p, 6 fig, 8 ref, append.

Descriptors: *Soil water movement, *Soil moisture meters, Tensiometers, Instrumentation, Calibrations, Moisture meters, Soil moisture, Soil water, Moisture tension.
Identifiers: Strain-gage tensiometers.

Sensitive, responsive tensiometers are highly useful in laboratory and field studies of water movement in unsaturated soil. Strain gage pressure transducers of the diaphragm type have been incorporated into a tensiometer system that has a short response time, is capable of detecting tension changes as small as a few millimeters of water and has the advantage of an electrical output that can be recorded. Construction details, precautions to be observed in use and operational procedures are given for direct reading and null modes of measurement. A manifold for the use of a single transducer with a number of tensiometer cups and the possible use of the tensiometer in field measurements are described. (See also W70-09275) (Knapp-USGS)
W70-09274

DIRECT MEASUREMENT OF MOISTURE POTENTIAL: A NEW TECHNIQUE,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
A. J. Peck, and R. M. Rabbidge.
French resume. In: Water in the Unsaturated Zon
Vol I, Proceedings of the Wageningen Symposiur
The Netherlands, June 19-25, 1966, Internation
Association of Scientific Hydrology, Publicatio
No 82, p 165-170, 1968. 6 p, 1 fig, 4 ref.

Descriptors: *Soil moisture meters, *Tensiometer
Instrumentation, Calibrations, Moisture meter
Soil moisture, Soil water, Moisture tension, Mem
brane processes, Osmosis, Membranes.
Identifiers: Osmotic tensiometer.

Although conventional tensiometers are simple an
capable of yielding fairly precise data, their usefu
ness is frequently limited by their range. Gypsum c
nylon blocks, which cover a much greater range c
moisture potentials, exhibit hysteresis and cor
sequently may be in considerable error. A ne
technique for direct measurement of moistur
potential over the full range of agricultural an
hydrological importance has been developed. Th
basis of this technique is that an osmotic solution
used to depress the zero of moisture potential in th
measuring instrument by a known amount. Water
exchanged between the soil and the instrument vi
a semi-permeable membrane until an equilibriur
of free energy of water is reached. The change c
free energy within the instrument can be designe
to be almost entirely a result of a change of pres
sure which actuates a pressure transducer. The in
strument can be adapted to measure either matri
or total potential. Tests of early models of the in
strument indicate response time constants of only
few minutes. (See also W70-09276) (Knapp
USGS)

**CAPILLARY CONDUCTIVITY DATA ESTI
MATED BY A SIMPLE METHOD,**
Institute for Land and Water Managemen
Research, Wageningen (Netherlands).
G. P. Wind.
French resume. In: Water in the Unsaturated Zone
Vol I, Proceedings of the Wageningen Symposium
The Netherlands, June 19-25, 1966, Internationa
Association of Scientific Hydrology, Publicatio
No 82, p 181-191, 1968. 11 p, 6 fig, 4 tab, 3 ref.

Descriptors: *Capillary conductivity, *Estimating
*Laboratory tests, Bouyoucos blocks, Permeame
ters, Soil water movement, Percolation, Unsatu
rated flow, Evaporation, Drying, Flow, Porou
media, Moisture stress.
Identifiers: Capillary conductivity estimation.

A simple method is given for estimating capillary
conductivity by study of soil samples in the labora
tory. A vertical column of soil is allowed to
evaporate at the top; all other sides are completely
closed. Every day the total weight of the column is
read and determinations are made of the moisture
content and moisture tension at a number of
depths. The velocity of flow for different depths
can be calculated from the changes in moisture
content and weight. The potential gradient can be
read from the moisture tension readings, making it
possible to calculate the capillary conductivity. A
difficulty is that a pF-curve is needed when
moisture content or moisture tension is deter-
mined. In the latter case, used in this paper, the
total amount of moisture in the column determined
from tension data and the pF-curve does not agree
with the amount determined from the total weight.
This means the flow velocity cannot be calculated
exactly. The reason is that the pF-curves used lack
sufficient reproducibility. They can be fitted to the
soil column used by the iteration technique
described. The capillary conductivity values, deter-
mined with the aid of Bouyoucos' electrical nylon
units, are fairly accurate at moisture tensions
between 0.1 to 20 atmospheres. Below 0.1 at-
mosphere they lack accuracy. An advantage of this
method is, that it is a true imitation of some
moisture flow processes which occur in nature and
to which knowledge of the capillary conductivity
has to be applied. (See also W70-09278) (Knapp-
USGS)

IFFUSIVITY DETERMINATION BY A NEW UTFLOW METHOD,
ommonwealth Scientific and Industrial Research rganization, Canberra (Australia). Div. of Plant ndustry.
. J. Peck.
rench resume. In: Water in the Unsaturated Zone, ol I, Proceedings of the Wageningen Symposium, he Netherlands, June 19-25, 1966, International ssociation of Scientific Hydrology, Publication o 82, p 191-202, 1968. 12 p, 7 fig, 12 ref.

escriptors: *Soil moisture movement, *Diffusivi-, Flow, Porous media, Laboratory tests, Per-eameters, Mathematical studies, Membrane rocesses, Osmosis, Membranes, Moisture tension, nsaturated flow.
dentifiers: Soil diffusivity.

method of deducing soil moisture diffusivities om laboratory outflow data is described. This ethod involves the matching of outflow data to a ngle theoretical curve regardless of the mem-rane conductance. The new method involves an ssumption of constant diffusivity over the range of oisture contents involved in a 'step'. In order that e experiments should approximately satisfy this ssumption, it is usual to use only small 'steps'. ata obtained from some of the outflow experi-ents reported, wherein the diffusivity varied by p to an order of magnitude, matched the theoreti-l curve as well as small step data. Diffusivities educed from these large step experiments agreed ell with the integrated means of small step dif-sivities. It appears that, with the new analysis the se of large steps is reasonable provided that the embrane conductance is greater than the hydrau-c conductivity of the test piece. An analysis of er-rs arising with the new method suggests that ossible errors in diffusivity of as little as 30% hould be readily obtainable and experimental data upport this. This is a significant improvement on revious data which indicate errors of up to an rder of magnitude. It is suggested that sample ariability may be the basis for such large errors. N INFILTRATION METHOD FOR THE ETERMINATION OF THE CAPILLARY CONUCTIVITY OF UNDISTURBED SOIL CORES,
nstitute for Land and Water Management esearch, Wageningen (Netherlands).
. Wesseling, and K. E. Wit.
rench resume. In: Water in the Unsaturated Zone, ol I, Proceedings of the Wageningen Symposium, he Netherlands, June 19025, 1966, International ssociation of Scientific Hydrology, Publication o 82, p 223-234, 1968. 12 p, 11 fig, 1 tab, 18 ref.

escriptors: *Capillary conductivity, *Soil water ovement, *Laboratory tests, Permeameters, Infil-rometers, Saturated flow, Unsaturated flow, Soil exture, Tensiometers, Sampling, Cores.
dentifiers: Capillary conductivity measurement, oil core samples.

method for the determination of the capillary onductivity was developed based onthe infiltra-ion of water into vertical columns. By using accu-ate drip feeding systems and small tensiometers ith a soil filling, instead of a porous cup it is possi-le to measure suction gradients and to compute K-values simply. The method developed was applied o both disturbed soil samples and to undisturbed ores. For the sandy material a relatively wide ange of suctions was found in which the capillary onductivity remains equal to the value of satura-tion. A good agreement was found between the point where the moisture content drops rapidly in the pF-curve with increasing suction and the point where the capillary conductivity drops with increasing suctions. For the finer textured soils the range of constant K-value is practically absent. The results of the disturbed sandy samples do not fit in the general equation proposed by Rijtema (1965). For the undisturbed samples, however, a fairly good agreement was found. (See also W70-09282) (Knapp-USGS)

DETERMINATION OF PORE SIZE BY THE AIR BUBBLING PRESSURE METHOD,
Institute for Land and Water Management Research, Wageningen (Netherlands).
W. P. Stakman.
French resume. In: Water in the Unsaturated Zone, Vol I, Proceedings of the Wageningen Symposium, The Netherlands, June 19-25, 1966, International Association of Scientific Hydrology, Publication No 82, p 366-372, 1968. 7 p, 2 fig, 16 ref.

Descriptors: *Porosity, *Porous media, *Laboratory tests, *Instrumentation, *Bubbles, Permeability, Soil water movement, Groundwater movement, Unsaturated flow, Surface tension, Wetting, Capillary action, Pore pressure, Hydraulic gradient, Pressure, Permeameters, Tensiometers.
Identifiers: *Pore size, Pore size determination, Air-bubble permeameters.

The air bubbling pressure method is often used to determine the largest pore size of ceramic material whose geometrical pattern is unchangeable. A regularly increasing pressure is applied to the water-saturated porous material. The pressure at which air bubbles start to escape from the material is read from a manometer and is called the air bubbling pressure. From this the equivalent diameter of the largest passageway can be calculated. This method is not only useful to check the maximum pore size of porous plates or membranes in soil physical research but makes it possible to relate pore size of sandy soils to the hydraulic conductivity and other properties. The air bubbling pressure may serve as the starting-pressure for the determination of the capillary conductivity. For sand separates the maximum air bubbling pressure was reached with sample-heights of 8 to 14 mm. (See also W70-09298). (Knapp-USGS)

MINING AND GROUNDWATER GEOPHYSICS/1967.
Geological Survey of Canada, Ottawa (Ontario).

Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, L. W. Morley, editor. Canada Geological Survey Economic Geology Report No 26, 1970. 722 p.

Descriptors: *Conferences, *Geophysics, *Exploration, *Groundwater, Surveys, Mapping, Water resources development, Electrical studies, Seismic studies, Magnetic studies, Borehole geophysics, Data collections, Hydrologic data, Hydrogeology, Geothermal studies, Gravity studies, Radioactivity, Remote sensing.
Identifiers: Geophysics symposium.

This volume is a record of the proceedings of the Canadian Centennial Conference on Mining and Groundwater Geophysics, held at Niagara Falls, Canada in October, 1967. One of the objects of the conference was to produce an up-to-date reference text on Mining and Groundwater Geophysics. The general subjects discussed include the state of the art, mapping, metals exploration, groundwater exploration, and national facilities for geophysical work. (See also W70-09393 thru W70-09409). (Knapp-USGS)

GEOPHYSICS IN PROSPECTING AND EXPLORATION FOR MINERAL DEPOSITS IN THE U.S.S.R.,
Ministerstvo Geologii, Moscow (USSR).
V. V. Fedynsky, V. V. Brodovoi, and V. A. Gelamkov.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Report No 26, p 667-687, 1970. 21 p, 17 fig, 1 tab, 29 ref.

Descriptors: *Geophysics, *Exploration, *Surveys, Reviews, Foreign research, Economics, Projects, Research and development, Groundwater, Borehole geophysics, Water resources development.
Identifiers: *USSR.

Geophysical methods are widely used in the Soviet Union in the exploration and prospecting of deposits of metallic and nonmetallic minerals and rare earths as well as groundwater. The organization of geophysical exploration is based on the principle of the interrelation of geological and geophysical data. Results of geophysical surveys are widely used for the compilation of metallogenetic, tectonic and geological maps. Geophysical methods are used not only in the direct search for orebodies but also in the indirect search, structural-tectonic and lithological features indicating favorable areas for further study. Borehole geophysics is receiving increasing attention, especially X-ray fluorescence, various electrical methods, three-component magnetometry and geochemistry. (See also W70-09392). (Knapp-USGS)

ELECTROMAGNETIC AERIAL SURVEY OF A FRESH WATER-SALT WATER CONTACT IN THE RHONE DELTA (FRENCH),
Bureau of Geologic and Mine Research (France); and Geoterrex Co. (France).
P. Baudoin, G. Durozoy, and M. Utard.
In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 626-637, 1970. 12 p, 12 fig, 1 tab, 7 ref.

Descriptors: *Magnetic studies, *Saline water-freshwater interfaces, *Aquifers, *Groundwater, Geophysics, Remote sensing, Surveys, Aircraft.
Identifiers: Airborne electromagnetic surveys.

The results of an airborne survey on a contact between salty and fresh groundwater previously studied by ground methods are presented. The geology consists of three to four layers, the first and third layer being conductive. The correlation between contour maps of the amplitude of EM anomalies and ground resistivity maps is good and evidence is given of detecting the main fresh-water zones. It is possible, in some cases, from the comparison of the various EM amplitude contour maps corresponding to measurements at various times after the end of the energizing pulse, to approximately determine whether apparent conductivity changes are caused by changes in shallow layers or at depth. More generally, EM maps established from a multitime or multifrequency EM system appear to be as interesting as some conventional resistivity maps obtained with various electrode spacings. The interpretation however is purely qualitative and has to be controlled by ground geophysics. (See also W70-09392) (Knapp-USGS)
W70-09394

GEOPHYSICAL PROSPECTING AND RESEARCH ON UNDERGROUND WATER (FRENCH),
J. J. Breusse.
In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 638-640, 1970. 3 p.

Descriptors: *Exploration, *Geophysics, *Groundwater, Surveys, Borehole geophysics, Electrical studies, Resistivity, Seismic studies, Hydrogeology, Water table, Aquifers.
Identifiers: Groundwater prospecting.

The principal methods which are applied to groundwater investigations and the types of hydrogeological problems to which geophysical techniques can be applied are discussed. The principal electrical methods are: resistivity, profiling, resistivity mapping and electrical sounding. Seismic refraction is generally used to complement electrical methods. The main hydrogeological problems dealt with by geophysics are alluvial formations, perched water-tables, the search for basins, sand-dune aquifers and the reconnaissance studies of aquifers penetrated by saline waters. For structural studies, geophysics can be used for delineating horsts, grabens, water sills, granitic sands and fracture zones. Electrical logging methods have wide application. Still the most widely used geophysical methods in hydrogeology are the lightweight and economical electrical methods. (See also W70-09392) (Knapp-USGS)
W70-09395

GEOPHYSICAL STUDIES IN PERMAFROST REGIONS IN THE U.S.S.R.,
Moscow State Univ. (USSR). Dept. of Geophysics.
A. A. Ogilvy.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 641-648, 1970. 8 p, 9 fig, 1 tab, 1 ref

Descriptors: *Geophysics, *Permafrost, Electrical studies, Seismic studies, Exploration, Resistivity, Velocity, Frozen soil, Frozen ground, Geothermal studies.
Identifiers: USSR, Permafrost geophysics.

Nearly half the territory of the Soviet Union is covered by permafrost. It is widely studied by geophysics, especially be geoelectric methods. The resistivity of frozen soils depends on the ratio of ice and water contained in the pores. Sand resistivity increases sharply when temperature drops below -0.5 deg C. Clay acquires high resistivity with a drop in temperature to from -2 to -6 deg C. The velocity of propagation of elastic waves considerably increases in frozen soils. By electrical soundings the upper and lower surfaces of permafrost can be determined. Measurement of rock resistivity conducted in fixed-time intervals make it possible to determine shifts in the permafrost boundary. Observations on the advance and retreat of permafrost are important for populated areas, mines, hydrotechnical and other engineering projects. (See also W70-09392) (Knapp-USGS)

GEOPHYSICS IN UNITED NATIONS PROJECTS,
United Nations, New York.
J. M. Brown.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 651-657, 1970. 7 p, 1 tab.

Descriptors: *Geophysics, *Exploration, *Groundwater, *United Nations, Projects, Reviews, Surveys, Governments, Water resources development.
Identifiers: Groundwater prospecting.

The United Nations is engaged in conducting large exploration programs in the developing countries throughout the world. Extensive use is made of applied geophysics. The objectives vary but the larger programs are designed to prepare the way for investment by the Government or private sector according to national policy. The geophysical element of these programs usually includes aerial survey followed by ground geophysics together with geological and geochemical surveys. From analysis of the data so obtained further geophysical surveys may be undertaken in order to select drilling targets. Operations include investigations for porphyry copper mineralization, iron ores, potassium deposits and so on. Others are in the field of geothermal energy and in groundwater. Geophysics also features in the establishment of training institutes and in the provision of fellowships. Of the larger programs being undertaken by the United Nations a few are in the final stages and from the analysis of these, sound contributions to economic development can be expected. THE USE OF SEISMIC REFRACTION AN GRAVITY METHODS IN HYDROGEOLOG CAL INVESTIGATIONS,
Geological Survey, Raleigh, N.C.; and Nort Carolina Univ., Raleigh.
Gordon P. Eaton, and Joel S. Watkins.
French resume. In: Mining and Groundwate Geophysics/1967, Proceedings of Canadian Cen tennial Conference at Niagara Falls, Canada, Oc 1967, Canada Geological Survey Economic Geolo gy Report No 26, p 544-568, 1970. 25 p, 16 fig, tab, 91 ref.

Descriptors: *Seismic studies, *Gravity studie *Aquifers, *Groundwater, *Hydrogeology, Wate resources development, Porosity, Water storage Sediments, Glacial drift, Data collection Hydrologic data, Mapping, Exploration, Subsur face investigations.
Identifiers: Groundwater prospecting.

The capacity of unconsolidated deposits to stor water depends on their porosity, thickness an shape; thus geophysical methods that provide infor mation relating to these factors provide technique for both search and evaluation. Although many fac tors have a bearing on velocity and density, porosi ty is a particularly important factor. Low density and low velocity are a direct indication of high tota porosity and potential water storage capacity, an hence a useful guide to unconsolidated aquifers Under ideal circumstances, the seismic metho provides a means of determining the three-dimen sional geometry of the aquifer, the gross stratig raphy and local lithofacies variations of the aquifer and depth to the water-table. The gravity metho can be used alone as a reconnaissance tool fo evaluating bedrock topography beneath the aquife in some areas, and locally for quantitative estimate of depth to bedrock. Used with the seismic metho or with borehole data, surface measurements o gravity provide a means of determining the average total porosity of the deposit and, in some instances even a measure of specific yield. BOREHOLE GEOPHYSICS AS APPLIED TO GROUNDWATER,
Geological Survey, Denver, Colo.
W. Scott Keys.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 598-614, 1970. 17 p, 8 fig, 20 ref.

Descriptors: *Borehole geophysics, *Hydrogeology, *Aquifers, Groundwater, Surveys, Data collections, Electrical studies, Exploration, Logging (Recording), Radioactivity, Resistivity, Subsurface investigations, Instrumentation.
Identifiers: Groundwater prospecting.

The Water Resources Division of the U. S. Geological Survey is conducting research on the application of borehole geophysics to groundwater investigations. The various logging techniques include: natural gamma; gamma-gamma; neutron-gamma; neutron-neutron; spontaneous potential;

single point, short-, and long-normal resistivity; caliper; sonic velocity; flowmeter; radioactive tracer; fluid resistivity; and gradient and differential temperature. Geophysical logs can be interpreted in terms of the geometry, resistivity, bulk density, porosity, permeability, moisture content, and specific yield of water-bearing rocks and the source, movement, and chemical and physical characteristics of water. Geophysical logs are often the only means of obtaining information from old wells and lateral extrapolation of geologic and hydrologic conditions. Logging can partially supplant coring. Data obtained from samples become more meaningful when used with geophysical logs because logs provide continuous average values for a volume of material much larger than that of extracted samples. New lightweight logging equipment is economically compatible with present well costs and with the value of water. (See also W70-09392) (Knapp-USGS)
W70-09400

GEOPHYSICAL PROSPECTING FOR GROUNDWATER IN THE SOVIET UNION,
Moscow State Univ. (USSR).
A. A. Ogilvy.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 536-543, 1970. 8 p, 8 fig, 7 ref.

Descriptors: *Geophysics, *Surveys, *Groundwater, *Water resources development, Permeability, Storage coefficient, Electrical studies, Seismic studies, Borehole geophysics, Density, Nuclear meters, Electrical well logging, Resistivity, Exploration, Subsurface investigations.
Identifiers: USSR, Groudwater prospecting.

Geophysics has been applied to groundwater exploration in the Soviet Union since 1929. The principal groundwater problems dealt with are investigations of permeability and water-bearing properties of rocks, search for groundwater accumulations, and studies of groundwater movement. Electrical prospecting, electrical logging, and to a lesser extent, seismic prospecting are the principal methods used to solve these problems. Geophysical methods are widely used in groundwater studies in permafrost regions covering about 43 percent of the area of the Soviet Union. They are commonly applied in determining the interface between fresh and salt waters near sea shores and particularly in the search for fresh-water lenses that are principal water-supply sources in deserts. (See also W70-09392) (Knapp-USGS)
W70-09401

A REVIEW OF SOME PROBLEMS OF SEISMIC PROSPECTING FOR GROUNDWATER IN SURFICIAL DEPOSITS,
Saskatchewan Univ., Saskatoon.
Kenneth B. S. Burke.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 569-579, 1970. 11 p, 6 fig, 48 ref.

Descriptors: *Seismic studies, *Surveys, *Aquifers, *Hydrogeology, *Groundwater, Water resources development, Water-table, Permeability, Porosity, Sands, Velocity, Data collections, Hydrologic data, Geophysics, Exploration, Subsurface investigations.
Identifiers: Canada, USSR, Groundwater prospecting.

Seismic prospecting is often used in the search for groundwater supplies in surficial deposits. The usual targets in this search are unconsolidated or semiconsolidated deposits of clastic material, confined by less permeable deposits. Besides the normal limitations of the seismic method, three particular problems confront the seismologist. These are: (1) the difficulty of generating simple seismic bodily waves in unconsolidated materials; (2) the lack of a definitive relationship between seismic velocity and a particular deposit; and (3) the much greater significance of errors in small-scale seismic investigation. Amplitude and frequency studies are promising in removing some of the restrictions imposed by the lack of velocity contrasts. In one example such studies provided useful information on the identity and porosity of an aquiferous sand in the USSR. However, an attempt to repeat this experiment under similar conditions in Canada failed, probably because of unavoidable changes in shothole characteristics. The possible role of the electroseismic effect in determining permeability is mentioned. (See also W70-09392) (Knapp-USGS)
W70-09402

INTEGRATION OF GEOPHYSICAL METHODS FOR GROUNDWATER EXPLORATION IN THE PRAIRIE PROVINCES, CANADA,
Research Council of Alberta, Edmonton.
D. H. Lennox, and V. Carlson.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 517-535, 1970. 19 p, 6 fig, 4 tab, 44 ref.

Descriptors: *Geophysics, *Surveys, *Groundwater, *Water resources development, Hydrogeology, Data collections, Hydrologic data, Seismic studies, Resistivity, Electrical studies, Gravity studies, Aquifers, Grasslands, Geology, Exploration, Subsurface investigations.
Identifiers: Canada, Groundwater prospecting.

In the Canadian prairies, geophysics has had two main uses as an aid in groundwater exploration: delineation of the preglacial drainage pattern and mapping the location and extent of buried permeable deposits of Pleistocene and Recent age. Delineation of the preglacial drainage pattern may involve mapping the elevation of the bedrock surface or simply tracing geophysical anomalies associated with preglacial river courses. Seismic refraction has commonly been used for the former purpose, resistivity and gravity for the latter. Resistivity has also proved suitable for mapping the location and extent of the buried permeable Pleistocene and Recent deposits. Considerable effort has been expended on geophysical exploration for groundwater in the Canadian prairies but comparatively little on critical evaluation of the effectiveness of the various methods in a variety of geologic situations. More case-history studies are required to remedy this deficiency and to provide a more reliable picture of the role of each method as a member of an integrated exploration team. (See also W70-09392) (Knapp-USGS)
W70-09403

INTEGRATION OF GEOPHYSICS AND HYDROGEOLOGY IN THE SOLUTION OF REGIONAL GROUNDWATER PROBLEMS,
Water Planning for Israel Ltd., Tel-Aviv.
Z. L. Shiftan.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 507-516, 1970. 10 p, 2 fig.

Descriptors: *Geophysics, *Surveys, *Water resources development, Hydrogeology, Data collections, Hydrologic data, Data processing, Mapping, Water wells, Resistivity, Electrical studies, Gravity studies, Magnetic studies, Exploration, Subsurface investigations.
Identifiers: Israel, Groundwater prospecting.

The present worldwide increase in the demand for groundwater is responsible for the growing number of groundwater exploration and development projects of regional size, requiring accuracy in the evaluation of available resources. For this purpose, an integrated application of geological, geophysical and hydrological methods and test drilling is needed. In such projects, geophysics is employed mainly in coordination with geological studies and drilling, to establish a model of the subsurface structure of the region and the existing aquifers. It also serves as an instrument for the solution of a variety of special hydrological problems, such as groundwater salinity distribution and localization of regions of groundwater flow. (See also W70-09392) (Knapp-USGS)
W70-09404

THE ROLE OF GEOPHYSICS IN THE DEVELOPMENT OF THE WORLD'S GROUNDWATER RESOURCES,
Geological Survey, Denver, Colo.
Don R. Mabey.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 267-271, 1970. 5 p, 5 fig.

Descriptors: *Geophysics, *Surveys, *Groundwater, *Water resources development, Hydrologic data, Data collections, Hydrogeology, Gravity studies, Seismic studies, Electrical studies, Magnetic studies, Exploration, Subsurface investigations.
Identifiers: Groundwater prospecting.

All of the standard airborne, surface, and borehole geophysical methods have found some use in groundwater investigations. Electrical and seismic surveys are the most common surface methods, and electrical and gamma-ray logs the most common borehole methods. However, adequate geophysical support for a diversified groundwater program requires that all of the standard geophysical techniques be available when needed. The trend in groundwater investigations is toward looking at problems on a regional basis rather than to the development of a single well or well field. A properly designed and executed program of geophysics can make a major contribution to programs of this type. The development in recent years of more extensive and better-supported water resource programs has resulted in a greater effort in groundwater geophysics. As the value of fresh water increases, and as societies become more aware of the long-range problems relative to obtaining adequate supplies of fresh water, the need and support for groundwater geophysics will expand. SEISMIC METHODS IN MINING AND GROUNDWATER EXPLORATION,
Geological Survey of Canada, Ottawa (Ontario).
George D. Hobson.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 148-176, 1970. 29 p, 37 fig, 1 tab, 63 ref.

Descriptors: *Seismic studies, *Groundwater, *Surveys, Investigations, Geophysics, Aquifers, Water levels, Data collections, Hydrologic data, Hydrogeology, Instrumentation, Exploration, Subsurface investigations.
Identifiers: Canada, Groundwater prospecting.

Oil prospecting seismic techniques and equipment can be used, with minor adaptation, for problems associated with mineral and groundwater environments. Compact portable seismographs are now available, most of which are used principally in the refraction mode while there are a few that can record reflected events. Most of these portable seismographs can be used with a hammer struck against a steel plate on the ground as a source of energy thus precluding the use of costly drill holes and explosives. Various types of repetitive sources of energy used in oil prospecting could also be used in mineral prospecting. The various portable

seismographs and their special adaptabilities or features, repetitive sources for land and marine seismic programs and some field techniques are presented for comparison and discussion. Some applications of shallow seismic techniques are set forth with a few typical field results from projects designed and conducted towards the search for minerals and water. APPLICATION OF RESISTIVITY METHODS IN MINERAL AND GROUNDWATER EXPLORATION PROGRAMS,
Colorado School of Mines, Golden.
George V. Keller.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 51-66, 1970. 16 p, 18 fig, 2 tab, 24 ref.

Descriptors: *Electrical studies, *Electrical conductance, *Geophysics, *Surveys, *Groundwater, Resistivity, Electrical well logging, Water resources development, Data collections, Hydrologic data, Data processing, Hydrogeology, Porosity, Permeability, Mapping, Water levels, Exploration, Subsurface investigations.
Identifiers: Canada, Groundwater prospecting.

The 'direct-current' resistivity methods have been used for about a half century and have reached a certain degree of maturity. In many respects, particularly in design of field equipment and approach to interpretation of field data, little has changed in the past twenty to thirty years. In other respects, including the design of field programs and the evaluation of resistivity measurements in geologically meaningful terms, rapid advances are currently being made. During the past decade, the electrode arrays used in field surveys have changed, and now, one may select an array which is best suited for a specific problem. For example, the Schlumberger array provides the greatest depth of penetration for a given amount of work, while the dipole array provides the greatest safety in working in areas where there is a great deal of culture. Studies of the relationship between resistivity and other rock characteristics, such as porosity, texture, salinity of groundwater and content of ore minerals, have provided a basis for evaluating resistivities once they are measured, as well as a basis for predicting the probable success of resistivity surveys for specific exploration problems. Descriptors: *Geophysics, *Gravity studies, *Surveys, *Groundwater, *Water resources development, Investigations, Data collections, Hydrologic data, Hydrogeology, Porosity, Density, Cumputers, Data processing, Mapping, Borehole geophysics, Exploration, Subsurface investigations.
Identifiers: Canada, Groundwater prospecting, Borehole gravimeters.

Improvements in the portability, range, calibration, accuracy and drift characteristics of modern land gravimeters provide data of increased accuracy in conjunction with a decrease in time, effort and cost for a survey. The new instruments also make possible the execution of special work such as gravity-gradient surveys, three-dimensional mine surveys and offshore gravity surveys. A more difficult problem has been the development of gravimeters for use on moving platforms. Much progress has been made on gravimeters for shipboard use but airborne systems are still in the experimental stage. The borehole gradiometer offers real promise for providing porosity estimates in groundwater studies and density estimates in mining work. Computerized field data handling permits rapid data plotting and contouring as well as swift and accurate reductions including the terrain correction, and, in the case of moving platform systems, processing of information from other sensors. Computerized data handling can be conveniently grouped in two categories: separation of local and regional anomalies and the fitting of density models to explain the observed gravity field. A number of techniques for resolving these problems are available and many others are still under consideration. (See also W70-09392) (Knapp-USGS)

INTERPRETATION OF GEOELECTRICAL RESISTIVITY MEASUREMENTS FOR SOLVING HYDROGEOLOGICAL PROBLEMS,
Federal Earth Research Inst., Hanover (West Germany).
H. Flathe.
French resume. In: Mining and Groundwater Geophysics/1967, Proceedings of Canadian Centennial Conference at Niagara Falls, Canada, Oct 1967, Canada Geological Survey Economic Geology Report No 26, p 580-597, 1970. 18 p, 24 fig, 23 ref.

Descriptors: *Electrical studies, *Aquifers, *Groundwater, *Surveys, Resistivity, Seismic studies, Porosity, Permeability, Hydrogeology, Data collections, Hydrologic data, Exploration, Subsurface investigations.
Identifiers: Groundwater prospecting.

The interpretation of geoelectrical resistivity measurements for hydrogeological problems is substantially determined by the physical parameter of specific electric resistivity. In the treatment of hydrogeological problems we have to deal exclusively with the ionic conductivity of the soil and this, again, depends on the pore or interstitial volume of the rock, on its water saturation and on the electrolytic content of the groundwater. The dependence of the specific resistivity on the electrolytic content of the pore water renders the geoelectrical resistivity method an effective means for fixing the limit between fresh and salty groundwater. The significance of the geoelectrical resistivity method is that it is capable, used with the seismic method, to subdivide a horizontally stratified aquifer system. Case histories from humid and arid areas illustrate how, be geoelectrical resistivity measurements, hydrogeological problems may be solved using a suitable combination of the presently available methods of interpretation. CHAPTER 4: MONITORING THE ENVIRONMENT.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

Washington, D.C., National Academy of Sciences - National Academy of Engineering, Jaunuary 1970. p 37-42.

Descriptors: *Monitoring, *Environment, Institutions, Environmental effects, Management, Planning, Administration.
Identifiers: *Environmental monitoring program, *Environmental quality index, Environmental quality.

The environment cannot be effectively managed without knowing what it is or how it behaves. Accordingly an environmental monitoring program is recommended with a high priority. Such a monitoring program must include at least the following: (1) Physical and chemical properties of land, air, and water; (2) Distribution of plants and animals in land, air, and water; (3) Land use, including diversity of purpose; (4) Construction; (5) Noise; (6) Epidemiology of man, animals, and plants; (7) Evidence of environmental stress, such as tranquilizer consumption and a social behavior; and (8) Aesthetic qualities. Also recommended is an overall environmental quality index which would serve as a management tool in developing priorities among environmental programs. Finally it is recommended that federal programs for comprehensive and systematic monitoring of environmental quality be carried out by an environmental monitoring agency. COLOR-VELOCITY METHOD IN MEASURING DISCHARGE,
United States Lake Survey, Detroit, Mich.
Ira M. Korkigian, and Thomas E. Ottenbaker.
Available from NTIS as AD-706 874, $3.00 in paper copy, $0.65 in microfiche. Lake Survey Miscellaneous Paper no MP-70-1, Jun 1969. 34 p.

Descriptors: *Flow measurement, *Fluorometry, *Flow rates, Open channel flow.
Identifiers: St. Clair River, Michigan.

This is the first attempt by the U.S. Lake Survey in applying fluorescent dyes for measurement of the discharge in an open channel. The purposes of the tests were: (1) to become familiar with the instrumentation and the use of fluorescent dyes, and (2) to compare the results of the dye method with standard current meter methods. Five tests were run, with three being run simultaneously with standard methods.

STUDY OF THE USE OF AERIAL AND SATELLITE PHOTOGRAMMETRY FOR SURVEYS IN HYDROLOGY,
National Environmental Satellite Center, Washington, D.C.
Everett H. Ramey.
Available from NTIS as PB-191 735, $3.00 in paper copy, $0.65 in microfiche. ESSA Technical Memorandum, NESCTM-14, Mar 70. 31 p.

Descriptors: *Hydrography, Satellites, *Data collections, *Remote sensing.
Identifiers: Satellite photogrammetry.

The study was undertaken to explore possible applications of photogrammetry in problems of hydrology. The critical factors in the use of satellite photographs are included as part of this study. Also the various physical and economic factors in the use of aerial photogrammetry are analyzed in the measurement of both snow cover and snow depth. It was concluded that the required accuracy can be attained, but sometimes the cost would be prohibitive. The use of aerial photography and other related sensors to some other problems in hydrology are considered. Here it seems that such remote sensing from aircraft offers the hydrologist a feasible means to map some special events where detailed mapping is needed.

APPLICATION OF REGRESSION ANALYSIS IN HYDROLOGY,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
N. Tywoniuk, and K. Wiebe.
Canada Department of Energy, Mines and Resources Inland Waters Branch, Technical Bulletin No 24, 1970. 18 p, 2 fig, 9 ref.

Descriptors: *Statistical methods, *Regression analysis, Correlation analysis, Data processing, Hydrologic data, Statistical models, Mathematical studies.
Identifiers: Canada.

The use of regression analysis as one of the statistical tools in the field of hydrology is explained. Its main applications are in the study of the relationship between two or more hydrologic variables and the investigation of dependence between the successive values of a series of hydrologic data. Hydrologic data rarely, if ever, completely meet the requirements or assumptions on which the regression method is based. Its main difference from correlation analysis should be emphasized: the regression method does not require that the variables be normally distributed as does the correlation method. Graphical and analytical regression analyses are among the most useful statistical tools in hydrology. The use of the digital computer considerably reduces the work of the analytical analysis making it possible to include variables which would otherwise go unnoticed. The analytical analysis must be done with care and with the help of graphical plots, otherwise it is possible to get nonsense correlations or to draw unwarranted inferences from the data. AN EVALUATION OF THE PROBLEMS OF SANITARY SEWER SYSTEM DESIGN,
Johns Hopkins Univ., Baltimore, Md. Dept of Sanitary Engineering and Water Resources.
John C. Geyer, and John J. Lentz.
Final Report of the Residential Sewerage Research Report of the Federal Housing Administration Technical Studies Program, (1964). 115 p, 24 fig, 25 tab, 7 ref.

Descriptors: *Sewers, *Sanitary engineering, *Hydraulic design, *Municipal wastes, *Maintenance, *Operating costs, Infiltration, Root system, Data collections, Collapse, Pumping plants, Urbanization.
Identifiers: *Sanitary sewers, *Sewer design, *Sewer design problems, *Flow estimates, Sewage pumping stations, Data collection, Residential sewer systems, Sewer stoppages, Engineering design.

Describes the most extensive coordinated investigation into the functioning of sanitary sewers ever conducted, according to the authors. Operational, maintenance, and design problems confronting sewer designers were studied using field data collected in four U. S. communities: Springfield, Missouri; Anaheim, California; Bradenton, Florida; and Baltimore County, Maryland. The extensive four-year data collection program was organized and coordinated by Johns Hopkins personnel. The data was used to study the nature and functioning of sanitary sewerage systems serving residential communities. It was found that fewer sewer blockages result when grades are moderate, and that more blockages occur at the upper terminals of the sewer lines. The distance between manholes appears to have little influence on the costs of relieving stoppages. The maximum manhole spacing is limited by the reach of sewer cleaning equipment. The basic causes of sewer maintenance problems are tree roots, accumulations of debris in the absence of roots, and, in areas having cohesionless soils, cave-ins. Infiltration of groundwater and stormwater was found to be excessive and unpredictable in all systems studied, making the use of estimated domestic flow quantities meaningless for design purposes. Limited data on costs of operating and maintaining sewage pumping stations are reported and evaluated. Many tables, illustrations and charts, useful in sanitary sewer design, are included. (Poertner)

ELECTRONIC COMPUTER PROGRAM FOR HYDRAULIC ANALYSIS OF BOX CULVERTS (BPR PROGRAM HY-3),
Bureau of Public Roads, Washington, D.C.
J. R. Link, R. C. Tennent, and L. J. Harrison.
Available from NTIS as PB-191 356, $3.00 in paper copy, $0.65 in microfiche. Supersedes PB-168 717. 5th Printing, Sep 67. 51 p, 1 fig, 3 tab.

Descriptors: *Roads, *Culverts, *Drainage systems, Drainage programs, Hydraulic design, Hydraulic engineering, Computer programs, Civil engineering, Pipes.
Identifiers: *Box culverts.

This program is used for the hydraulic analysis of box culverts for given hydrological data and site conditions. The program determines the size of culvert which satisfies the hydrological data and site conditions for inlet control and outlet control. The output includes: number of barrels, culvert width, culvert height, headwater and outlet velocities. Outlet control calculations make use of backwater calculations.

ABOUT THE ROUGHNESS PROBLEM IN PIPES AND TUNNELS,
Technische Hochschule, Munich (West Germany).
P. G. Franke.
13th Congr Int Assn Hydraul Res, Proc Vol 2, p 349-355, Aug-Sept 1969. 7 p, 3 fig, 13 ref.

Descriptors: *Pipes, *Tunnels, Surface properties, *Tunnel hydraulics, *Roughness coefficient, *Roughness (Hydraulic), Energy losses, Sands, Bituminous materials, Hydraulics, Operations, Foreign research, Grain sizes.
Identifiers: *Friction factors, *Pipe linings, Friction coefficient (Hyd), *Resistance coefficients, Germany, *Rugosity.

The effect of variations in surface roughness in pipes and tunnels is demonstrated, and the difference between technical roughness and equivalent sand grain roughness is explained. The cause and effect of alterations in effective roughness of closed conduit linings are variable. Apart from the quality of water and the height of the roughness elements, the texture and pattern are particularly important. Especially remarkable is the ripple-like roughness that is formed by certain quality waters. Compared with the equivalent sand grain roughness of equal height, much larger friction factors result. The simulated sand roughness is to be considered as a parameter for the roughness conditions only; in analogy, the relative roughness is also a parameter. Case histories of various pipe installations in Europe are discussed. (USBR)

ZONE LENGTHS OF AIR EMULSION IN WATER DOWNSTREAM OF THE RING JUMP IN PIPES,
Hydraulic Research Inst., Prague (Czechoslovakia).
K. Haindl.
13th Congr Int Assn. Hydraul Res, Proc Vol 2, p 9-19, Aug-Sept 1969. 11 p, 4 fig, 7 ref.

Descriptors: *Pipes, *Pipe flow, Hydraulic jump, Turbulent flow, Flow, Turbulence, *Air, Hydraulics, Cones, Valves, Water treatment, Energy dissipation, Aeration, *Reaches (Distance), Deaeration, Fluid flow.
Identifiers: *Ring jump, Air-water mixtures.

Basic properties of ring jump in closed conduits are discussed. The hydraulic phenomenon in which the water ring flowing along pipe walls enlarges into a flow through the whole profile is called ring jump. It manifests itself, as does the usual hydraulic jump, by vortices and high turbulence flow, in this case by the formation of characteristic vortices in planes drawn through the pipe axis. Its occurrence is subject to the equality of the flow pressure force downstream of the jump and the dynamic force of the moving ring. The ring jump forces air from the space in front of the jump into the pressure flow following the jump and mixes all fluid components into homogeneous flow. Within the intense turbulent flow following the jump in the air turbulence zone in the liquid and also in the vortices of the jump, both fluid comoponents influence each other very effectively. This phenomenon may be applicable to conditioning and treatment of water, and for dissipation of kinetic energy from dispersion cone valves and the aeration of outflowing water. (USBR)

TURBULENT DIFFUSION IN A STABLY STRATIFIED SHEAR LAYER,
Colorado State Univ., Fort Collins.
Fazal H. Chaudhry, and Robert N. Meroney.
Technical Report C-0423-5 Sept. 1969. 185 p, 61 fig, 5 tab, 73 ref.

Descriptors: *Diffusion, *Thermal stratification, *Boundary layers, *Tunnels, *Simulation analysis, *Air pollution, Turbulence, Diffusivity, Velocity, Fluid Mechanics, Radioisotopes, Theoretical analysis, Laboratory tests.
Identifiers: *Gaussian effect, *Similarity theory, *Three dimensional analysis, Ground level concentrations, Atmospheric surface layer.

Diffusion of a passive substance released from a continuous point source in a stably stratified shear layer is investigated both theoretically and experimentally. Using Monin-Obukhov's velocity profile and assuming a vertical eddy diffusivity which is a power function of the stability parameter, z/L, the Eulerian turbulent diffusion equation is solved to obtain expressions for vertical and longitudinal velocities of the center of mass of a cloud in the constant stress region. These expressions give physical substance to those suggested by Gifford (1962) and Cermak (1963 as intuitive extensions of Batchelor's Lagrangian similarity theory. A stably stratified shear layer was produced by heating the air and cooling the wind tunnel floor. Detailed observations of the diffusion field, downwind ground and elevated point sources, have been made using Krypton-85 as a tracer. The concentration characteristics obtained from diffusion experiments show excellent agreement with those observed in the atmosphers. The data compares well with the predictions of similarity theory. It appears that the parameters evaluated in the field by Klug (1968) hold also for the wind tunnel data. The data support the assumption of a Gaussian effect of source height, for elevated releases, on the ground level concentration. (Hsieh-Vanderbilt)

OPERATING FORCES ON SECTOR GATES UNDER REVERSE HEADS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. R. Oswalt.
Sponsored by U.S. Army Engineer District, New Orleans. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-2, March 1970. 13 p, 6 tab, 8 pl.

Descriptors: *Hydraulic models, *Gates, *Floodgates.
Identifiers: *Sector gates, *Operating forces, Reverse head (Fluid mechanics).

In southern Louisiana several existing sector gate locks have experienced operational difficulties during reverse heads of 1.0 ft or greater. The sector gate would stall at a small opening, resulting in delay at lockage or breakdown in machinery. A 1:20-scale model with one set of gate leaves was constructed to measure forces acting on sector gate during reverse heads, develop feasible modifications for elimination of stall at existing structures, and test a gate of new design for use in future structures. From past experiences and observation of flow in the model, it was considered that head differentials across the members of the gate near the nose of each leaf probably caused a major portion of the load on the gate machinery. Three modifications designed to reduce head differentials across the members near the gate nose were tested; type 2 gave the greatest force reduction for the least prototype change. Use of shorter seal brackets attached to skin plate was also recommended. (Spivey-Waterways Experiment Station)
W70-09177

WAVE ACTION AND BREAKWATER LOCATION, VERMILION HARBOR, OHIO; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
C. W. Brasfeild.
Sponsored by U.S. Army Engineer District, Buffalo. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-5, May 1970. 18 p, 6 tab, 4 photo, 6 pl, 7 ref.

Descriptors: *Breakwaters, *Hydraulic models, *Waves (Water), Shore protection.
Identifiers: *Vermilion Harbor, Ohio; Lake Erie.

Model investigation was made to test and develop plans for improvement proposed for reducing wave heights at the harbor entrance and in the outer reaches of Vermilion River channel. The 1:75-scale model, molded in cement mortar, reproduced approximately one-half mile of the Lake Erie shoreline on each side of harbor entrance, about 3600 ft of the river channel, several boat mooring lagoons off the main channel, and sufficient underwater contoured area to permit accurate simulation of storm-wave action. A 52-ft-long wave machine and electrical wave height measuring and recording apparatus were used. It was concluded that an offshore breakwater, approximately 700 ft long, installed perpendicular to entrance channel center line and 200 ft from outer end of the existing east channel pier would provide adequate protection from wave action. (Spivey-Waterways Experiment Station)
W70-09178

SPILLWAY AND OUTLET WORKS, ROWLESBURG DAM, CHEAT RIVER, WEST VIRGINIA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. H. Ables, and M. B. Boyd.
Sponsored by U.S. Army Engineer District, Pittsburgh. U.S. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-7, June 1970. 22 p, 6 tab, 7 photo, 31 pl.

Descriptors: Concrete dams, *Outlet works, *Spillways, Stilling basins, *Hydraulic models, *Open channel flow, *Sluices.
Identifiers: *Rowlesburg Dam.

Tests were conducted on a 1:20-scale sluice intake model and a 1:60-scale comprehensive model to study hydraulic performance of spillway, to verify adequacy of spillway and sluices for both separate and combined flow operation, to verify and/or to refine the stilling basin design, to study approach and exit channel conditions, to evaluate the effectiveness of the water-quality control tower and sluice in selectively withdrawing water from desired levels, and to investigate pressures in the sluice intake. The stage-discharge curve for combined uncontrolled spillway and sluice flow developed from model test results is in close agreement with computed curves. Capacity of structure is adequate. 12 stilling basin designs were tested, and one recommended over the others. Two schemes for selective withdrawal from top 15 ft of reservoir fell short of desired operating characteristics. (Spivey-Waterways Experiment Station)

EFFECTS OF EFFLUENT AND INFLUENT SEEPAGE ON THE HYDRODYNAMIC FORCES ACTING ON AN IDEALIZED NONCOHESIVE SEDIMENT PARTICLE,
Utah State Univ., Logan. Dept. of Civil Engineering.
M. V. Panduranga Rao.
Utah State University, PhD Dissertation, Dep of Civil Engineering, 1969. 133 p, 34 fig, 11 tab, 59 ref, 2 append. NSF Research Grant GK-913.

Descriptors: *Erosion, *Open channel flow, *Seepage, *Alluvial channels, *Hydraulic models, Viscosity, Hydrodynamics, Hydrostatic pressure, Flow around objects, Reynolds number, Instrumentation, Flumes, Model studies, Hydraulic similitude.
Identifiers: Hydrodynamic lift.

The effects of effluent and influent seepage on the hydrodynamic forces acting on an idealized noncohesive sediment particle were investigated experimentally. An attempt was made to dynamically simulate the hydrodynamic conditions prevailing near and within an alluvial channel bed by using the shear velocity Reynolds number and the seepage Reynolds number as modeling parameters. In order to achieve dynamic similarity between the laboratory sediment particles (which are 3.75 inches in diameter) and the natural sediment particles (size less than 1 mm) the model fluid used had a dynamic viscosity approximately 200 times greater than that of water. The laboratory flume used had provision for introducing seepage along a 5-foot portion of the 15-ft long bed. A parallel-link straingage dynamometer was designed to simultaneously measure drag and lift forces for different channel flow conditions with and without the effects of effluent or influent seepage. A range of shear velocity Reynolds number of 15 to 140 was covered. (Knapp-USGS)

THE NEW BRUNSWICK ELECTRIC POWER COMMISSION SOLID STATE-STATE HVDC ASYNCHRONOUS TIE INSTALLATION,
New Brunswick Electric Power Commission, Fredericton; Canadian General Electric Co. Ltd., Peterborough (Ontario); and General Electric Co., Schenectady, N.Y.
F. H. Ryder, C. M. Stairs, and G. D. Breuer.

Amer Power Conf, (Paper) Chicago, Ill, Apr 1970. 24 p, 6 fig, 7 ref.

Descriptors: Transmission (Electrical), *Direct current, *Converters (Electrical), Rectifiers, Alternating current, Economics, Electric power, Bus (Electrical), *Semiconductors, Electric cables, Reliability, Electronic equipment, Electric insulation, Coordination, Transmission lines.
Identifiers: *Solid-state valves, *Interties, Thyristors, Outages, Interconnected systems, New Brunswick, Canada, System stability (Elect).

Canada's New Brunswick Eel River HVDC Converter Station is the first solid-state hvdc system in the world and is important to connected power systems and future applications of hvdc. The project is in the design phase, with commercial operation scheduled for Oct 1, 1972. Many features of the installation use solid-state valves composed of series and parallel-connected thyristors (silicon-controlled rectifiers) differing from present hvdc systems. The installation will provide a nonsynchronour, 2-directional tie between 2 utility systems with all d-c equipment at one location. Rated at 320 mw, 80 kv dc, the converter station incorporates all the features of an hvdc system with the simplifications of all controls at one location and the absence of a d-c line. The power rating of 320 mw is a significant undertaking of importance to the power systems involved. The installation opens the way to other applications for hvdc transmission exploiting solid-state technology, including configurations of overhead lines and cables, and wider use of controlled transmission links and multiterminal hvdc systems. (USBR)
W70-09012

CATHODIC PROTECTION OF THE BONNEVILLE POWER ADMINISTRATION'S 34.5 KV SAN JUAN ISLANDS CABLE,
Bonneville Power Administration, Portland, Oreg.
A. Stanley Capon.
Nat Assn Corros Eng, 26th Annu Conf, (Paper 10) Philadelphia, Pa, Mar 1970. 5 p, 7 fig, 5 ref, append.

Descriptors: *Cathodic protection, *Electric cables, Corrosion, Tides, *Electric potential, Deterioration, Electric power, Transmission (Electrical), Magnetic fields, Electrodes, Sea water, Anodes, Washington.
Identifiers: San Juan Islands, Wash, *Submarine cables, Corrosion currents, Ground currents, Protective coverings, Bonneville Power Admn.

In 1951, the Bonneville Power Administration installed the first 3-conductor, galvanized armored submarine power cable between Fidalgo, Decatur, and Lopez Islands. Each conductor is 300 mcm and has a capacity of about 20,000 kw. Experience gained during operation of the first cable prompted double armoring of a portion of the second cable installed in 1966. The new cable has 3 conductors, each 500 mcm, and is rated at 34.5 kv with a 35,000-kw capacity. The cable armor and method of cathodic protection for the second cable are discussed. Problems pertaining to the cable operation are reviewed, and an analysis of cable armor potential is given. (USBR)
W70-09013

INTERNAL CATHODIC PROTECTION OF WATER COOLED PLANT,
Corrosion and Welding Engineering Ltd. (Great Britain).
R. A. Lowe, and J. W. L. F. Brand.
Nat Assn. Corros Eng, 26th Annu Conf, (Paper 31) Philadelphia, Pa, Mar 1970. 4 p, 3 fig, 1 tab.

Descriptors: Corrosion, *Corrosion control, Foreign design practices, *Cathodic protection, *Anodes, Titanium, Platinum, Cooling water, Saline water, Sea water, *Heat exchangers, Automatic control, Maintenance, Cast iron, Water cooling.
Identifiers: Great Britain, Condenser tubes.

Internal cathodic protection systems can be designed to cover all requirements for sea water-cooled plants by using a continuous-strip titanium anode platinized on one side. Advantages of the anode include: greatly reduced current density and operating voltage, improved throwing power, lower gross current requirement, reduced current loss to close cathode, and easy cutting and fitting. Installation of an experimental cathodic protection system in a nuclear power station condenser water box is discussed. Saline cooling water flows into one-half of the first water box, through one-half of the tube stack into the second water box, reverses direction to flow through the second half of the first box, and then to discharge. Automatic control of potential is used to compensate for changes in operating conditions from variations in salinity, oxygen content, velocity, temperature, coating efficiency, and surface condition. Special requirements for small boxes and application of cathodic protection to boxes already graphitized are discussed. An effective method for box repair is given, allowing for complete graphite removal and cathodic protection with no fear of losing the box. (USBR)
W70-09014

1969 HVDC STRAY CURRENT TESTS ON UNDERGROUND TELEPHONE CABLES,
Pacific Telephone and Telegraph Co., Pasadena, Calif.; and General Telephone Co. of California, Santa Monica.
H. G. Corbett, and James P. Davey.
Nat Assn. Corros Eng, 26th Annu Conf, (Paper 24) Philadelphia, Pa, Mar 1970. 6 p, 5 fig, 3 tab, 3 ref.

Descriptors: *Corrosion, Corrosion control, *Extra high voltage, Field tests, *Direct current, Electrodes, *Telephones, Polarity, Extra long distance, Instrumentation, Electric potential, Electric currents.
Identifiers: *Ground currents, *Buried cables, Southern California, Pacific Northwest-Southwest Intertie, Corrosion currents, Service life.

The 750-kv d-c Pacific Northwest-Southwest Intertie line, to be completed early in 1970, has been of concern to corrosion engineers. Since 1963, when the power system was first considered, the Pacific Coast telephone companies have been conducting tests in Southern California to determine whether there will be serious corrosion effects on underground telephone cables from the hvdc system. Preliminary tests show that cables quite remote from the hvdc ground electrode as well as those in close proximity may be influenced by the system. The degree of influence may not be predictable because any change in apparent earth resistivity, other stray currents, or change in polarity of the hvdc electrodes could change the environment enough to change the severity. Data collected from many diversified locations during these low current tests indicate that 15- to 20-min intervals of high earth current between the hvdc electrodes will not cause any more generalized type corrosion than normal telluric currents. Cables close to electrodes and cables that connect with remote areas are candidates for surveillance. Existing cables and new cables placed within built-up areas would be expected to have a normal service life. (USBR)
W70-09015

INSULATION LEVELS OF DC FILTER REACTORS AND RESISTORS FOR HVDC POWER TRANSMISSION,
Bonneville Power Administration, Portland, Oreg.
Narain G. Hingorani, and Stig A. Annestrand.
Inst Elec Electron Eng Trans Power App Syst, Vol PAS-89, No 4, p 610-618, Apr 1970. 9 p, 18 fig, 3 ref, disc.

Descriptors: *Extra high voltage, *Direct current, *Filters, Costs, Converters (Electrical), *Lightning arresters, *Electric insulation, *Resistors, Transmission (Electrical), Capacitors, Inverters, Faults (Electrical), *Electric reactors, Bridges (Electric), Transients, Electric potential.
Identifiers: Protection (Electrical), Harmonics, Overvoltage, Spark gaps, Flashover, Switching surges.

Insulation of reactors and resistors in the harmonic filter circuits on the d-c side of an hvdc converter station is discussed. The cost of the reactors and resistors is dependent on insulation levels, and could be a substantial part of the total filter costs if insulation levels are comparable to the insulation level of the d-c bus bars. Providing separate arresters across the reactors and resistors is essential because the d-c line arrester does not provide adequate protection for the components. By diligent use of arresters, the insulation levels and costs of the components can be reduced. Arrester duties are small compared to the capabilities of standard a-c arresters. In fact, the arresters would suppress transients on the d-c bus and would reduce the number of d-c arrester operations and assist the d-c arrester in arc quenching. A method of determining appropriate protective levels is presented. (USBR)

PREDICTION OF RELIABILITY AND AVAILABILITY OF HVDC VALVE AND HVDC TERMINAL,
General Electric Co., Philadelphia, Pa.; and Power Technologies, Inc., Schenectady, N.Y.
Charles R. Heising, and Robert J. Ringlee.
Inst Elec Electron Eng Trans Power App Syst, Vol PAS-89, No 4, p 619-624, Apr 1970. 6 p, 3 fig, 1 tab, 10 ref, disc.

Descriptors: *Extra high voltage, *Direct current, *Converters (Electrical), *Transmission (Electrical), Rectifiers, Reliability, Costs, *Electronic equipment, Design, Failure (Power), Forecasting, Valves, Analysis, Field data.
Identifiers: *High voltage, *Terminal facilities (Elect), Outages, Electric utilities.

A high-voltage direct-current terminal using silicon-controlled rectifiers (SCR's) contains several thousand electronic components. An availability and reliability prediction was made for an hvdc terminal containing SCR's for use in cost-reliability tradeoff decisions in designing the terminal to assure that the hvdc terminal would be designed adequately. This prediction was made using published failure rates for the electronic equipment. Published failure rates and outage duration times were used to such a-c equipment as power transformers and power circuit breakers. Field failure rate data were used for the SCR's. Estimates were used for the time required to replace electronic equipment in order to restore service. The approach used in these analyses is described, and the weakest links are identified and discussed. Silicon controlled rectifiers can be used for hvdc transmission because the system is designed to be fail safe when one or more SCR's fail. (USBR)

TRANSIENT OVERVOLTAGE ON A BIPOLAR HVDC OVERHEAD LINE CAUSED BY DC LINE FAULTS,
Bonneville Power Administration, Portland, Oreg.
Narain G. Hingorani.
Inst Elec Electron Eng Trans Power App Syst, Vol PAS-89, No 4, p 592-610, Apr 1970. 19 p, 31 fig, 15 ref, disc.

Descriptors: *Direct current, *Faults (Electrical), Transients, Costs, Extra high voltage, Capacitors, Digital computers, *Transmission lines, Lightning, Lightning arresters, Bibliographies, Simulation, Filters, Converters (Electrical), Frequency, Resistance, Electrical coronas, Electric insulation.
Identifiers: *Overvoltage, High voltage, *Bipolar transmission lines, Protection (Electrical), Terminal facilities (Elect), Flashover.

Digital programs are used to investigate the overvoltages induced in one pole of a bipolar hvdc overhead line caused by a line-to-ground fault on the

other d-c pole. Various digital tests are performed, paying particular attention to the nature of d-c line termination at the converter stations, including filter circuits and a surge capacitor. The terminal that looks inductive to a wavefront coming from the d-c line is undesirable because it would cause high overvoltages at the terminal of the unfaulted pole. In order to reduce the risk of developing a double-pole outage from a single-pole fault eliminating the surge capacitor is desirable, if a suitable d-c lightning arrester can be designed. Tests are presented in stages to isolate the effects of fault resistance, grid control, and line resistance. Results indicate necessary restraints on the dv-dt line fault detection to avoid operation of this protection in the unfaulted pole. Has 15 references. (USBR)

SWITCHING-SURGE CONSIDERATIONS IN UHV TRANSMISSION LINE DESIGN,
Southern California Edison Co., Los Angeles; and General Electric Co. Pittsfield, Mass.
Fred R. Klumb, and James J. LaForest.
Amer Power Conf, (Paper) Chicago, Ill, Apr 1970. 11 p, 4 fig, 1 tab 12 ref.

Descriptors: *Transmission lines, Research and development, Electrical insulators, Test facilities, Design, Test procedures, Contamination, Electric insulation, Polarity, Bundled conductors, Transmission towers.
Identifiers: *Switching surges, *Ultra high voltage, Flashover, Air gaps, Test results, Lightning surges, Project UHV, *Switching.

Ultra-high-voltage (uhv) research at Project UHV has demonstrated that uhv transmission lines can be constructed to withstand expected switching surges for 1500-kv transmission. Switching-surge studies at Project UHV are the continuation of research undertaken by the industry over many years, now given new life because of 345- to 765-kv transmission systems. Field and transient network analyzer studies showed that airgap spacings required to withstand switching surges were governing because as voltages and spacings were increased, lighning and 60-hz requirements became less important to switching surges for tower air gaps. Recently the trend has been changed where research in the 60-hz strength of contaminated insulator string strength suggests significant nonlinear effects in the uhv range across porcelain supports. Facets of the Project UHV switching-surge research program are reviewed, available uhv results are given, several important findings relative to line design are detailed, and a view of what is needed in this area as the new decade begins is presented. FLOW OF ENTRAINED AIR IN CENTRIFUGAL PUMPS,
Nagoya Univ. (Japan); Toyoda Coll. of Technology (Japan); and Mitsui Ship Building Co., Okayama (Japan).
Hakaru Suehiro, Tsuyoshi Isaji, and Mitsukiyo Murakami.
13th Congr Int Assn. Hydraul Res, Proc Vol 2, p 71-79, Aug-Sept 1969. 9 p, 16 fig, 1 tab, 2 ref.

Descriptors: *Centrifugal pumps, *Air entrainment, Experimental data, Pump testing, *Performance, Impellers, Flow characteristics, Air, *Flow, Losses, Test procedures, Specific weight, Foreign research, *Pumps.
Identifiers: *Air admission, Air bubbles, Japan, Test results, Flow patterns.

Entrained air in centrifugal pumps and its effect on pump performance were investigated. Three types of centrifugal pumps were used during the experiment in which known volumes of air were admitted to the suction side of a pump, and pump performance measured. Results show that pump capacity was reduced as the volume of entrained air increased. When the volume of entrained air on the pump suction side exceeded 15% of the water volume, every pump lost its prime. Entrained air is broken by the pump impeller into nearly uniform diameter bubbles ranging in size from 0.2 to 0.4 mm. Bubble size decreases as pump speed increases; the point of entrance of air bubbles and bubble size have little effect on pump performance. Work necessary to discharge entrained air constitutes the main loss in the pump with air admission. Different-type pumps have nearly the same characteristics for air admission. (USBR)

RAPID REVERSAL OF SAN LUIS PUMPING-GENERATING UNITS,
Bureau of Reclamation, Los Banos, Calif.; and Bureau of Reclamation, Denver, Colo.
R. G. Stroh, B. G. Seitz, and L. W. Lloyd.
Trans (Paper 69 TP 807 - PWR), Inst Elec Electron Eng/Amer Soc Mech Eng Joint Power Generation Conf, Charlotte, N C, Sept 1969. 8 p, 9 fig, 2 tab, 5 ref.

Descriptors: Power system operations, Time, *Pump turbines, Pumping, Hydroelectric plants, Hydroelectric power, Pumping plants, California, Efficiencies, Failure (Power), Pumped storage.
Identifiers: *Rapid reversal, *San Luis Pumping-Generating, Reverse flow, *Reversible turbines, Power system stability, *Pump-generators.

A proposal to reverse the San Luis Pumping-Generating Units from pumping to generating in seconds rather than the design time of 20 min was first made when the plant was nearly operational. An evaluation of the electrical, mechanical, and hydraulic duties on the units and the associated equipment showed that no abnormal stress for the proposed rapid reversal existed. Extensive control modifications were made on one of the units, permitting a series of tests that have verified the feasibility of the rapid reversal mode. Reversals from pumping to generating take from 40 sec at low head to 27 sec near the maximum head. One major advantage of this rapid reversal will be system support in the case of decaying system frequency. Other operational advantages are also seen. The rapid reversal mode may be suitable in part for more conventional pump-storage installations. (USBR)

CALCULATION OF RADIO NOISE LEVEL FOR THE DESIGN OF AC POWER TRANSMISSION LINES,
Central Research Inst. of Electric Power Industry, Tokyo (Japan).
Y. Sawada.
Elec Eng Jap, Vol 89, No 9, p 86-96, 1969. 11 p, 14 fig, 5 tab, 20 ref, append.

Descriptors: *Radio interference, *Transmission lines, Design, Foreign research, Rain, Calculations, Electric fields, *Weather, Bibliographies, Atmospheric precipitation, Conductors, Extra high voltage, *Electrical coronas.
Identifiers: Japan, Electric conductors, Test transmission lines, Test results, Ultra high voltage, Shiobara Test Lines.

Based on experimental studies, and using results of studies relating to radio noise levels on in-service transmission lines to the levels on experimental lines, a method of calculating transmission line radio noise in clear and rainy weather has been developed. The method differs from methods proposed in the past, and is based on statistical analysis of radio noise characteristics. Formulas are presented for calculating the radio noise level caused by conductor corona on transmission lines during fair and rainy weather conditions. The relation between precipitation rate and radio noise level is based on results obtained on the 600-kv Shiobara Test Lines in Japan. The application is intended for design of transmission lines, especially for selection of the conductor size based on a given geometrical arrangement. Has 20 references. (USBR)

IMPULSE DISCHARGE ON CONTAMINATED SURFACE,
Nagasaki Univ. (Japan); Kagoshima Univ. (Japan); and Kyushu Inst. of Tech. (Japan).
H. Matsuo, Y. Yunoki, and T. Oshige.
Elec Eng Jap, Vol 89, No 9, p 26-34, 1969. 9 p, 22 fig, 3 tab, 10 ref.

Descriptors: *Electrical insulators, *Contamination, Foreign research, Electrolytes, Electrodes, Electric arcs, Experimental data, Electrical coronas, Electric potential, Electrical equipment, *Electric insulation, Electric currents.
Identifiers: *Flashover, *Electric discharges, *Suspension insulators, Air gaps, Waveforms, Japan.

Clarifying the flashover mechanism of the contaminated surface in connection with the insulation breakdown of an insulator is important. Discharge on a contaminated surface differs greatly from air-gap discharge; the flashover voltage minimum does not occur in a contaminated surface discharge. Experimental studies of the impulse discharge on the electrolytic surface with the point and plate electrode are presented. Flashover voltage was invariant independently of the wave front duration of the impulse voltage. By using a photomultiplier placed along the discharge path, the partial discharge grows at a faster rate near the needle tip, slows down midway, and speeds up again near the plate. The flashover voltage for the contaminated surface can be raised by placing the barrier electrode between the needle and plate. The barrier electrode blocks the passage of the partial discharge, resulting in an increase of the flashover voltage. Suspension insulators equipped with barrier electrodes exhibit excellent flashover characteristics. (USBR)

Identifiers: Wicket gates, Packings, Corps of Engineers, Snake River, McNary Dam, The Dallas Project, Chief Joseph Dam Proj, Wash.

Problems encountered during operation and maintenance of large hydro turbines at the Bonneville, The Dallas, McNary, and Chief Joseph Projects on the Columbia River and at the Ice Harbor Project on the Snake River are described. The problems included the turbine and associated equipment, and involved: (1) grease line failure to the wicket gate lower bearing; (2) failure of the wicket gate combination thrust and guide bearing; (3) replacement of head cover sump pumps; (4) maintenance of turbine runners; (5) turbine failure during rejection tests; (6) failure of blade sevomotor flange gasket; (7) trouble with wicket gate clearances; and (8) rerating generators and the effect on turbines. Each problem is discussed and methods used for solution are given. Turbine data are tabulated for all the plants. (USBR)

he Russians are developing a magetohydrodynamic power generating plant which ill operate on natural gas and develop 75 MW, 25 IW of which will be produced by the generator nd the remainder by a bottoming steam plant. In ie generator plant, known as U-25, power is emoved via 48 electrode pairs along the channel, nd there are 48 investers which can be interconected in a multitude of ways to provide operating exibility. The main advantage of this method of ower generation is its efficiency, some 15% above iat of the conventional coal-fired stations. The aparent shortcomings of the Russian plant are its low ombustion pressure and field strength. (Greenanderbilt)

eports the preliminary findings of a systems analyis of the usefulness of nuclear energy centers in or ear large cities and the application of energy cenrs to the development patterns and problems of merican cities. It is concluded that in 1980 the eat from a nuclear energy center could be used to eat and air-condition a large portion of a large city t a cost per unit of heat equivalent to that now inurred by district heating in downtown commercial nd high-rise apartment areas. The areas served ould be much larger and they could consume uch less heat per unit of area than those now erved in this country by district-heating systems. leat from back-pressure steam and turbine bleed ould be used rather than heat from prime steam; herfore the waste of heat from the plant generating lectricity would be significantly reduced. Such a ystem would reduce both chemical pollution of he air and thermal pollution of streams. Calculaions indicate that distribution piping systems could e extended to serve larger areas economically, nd that the use of medium or high temperature vater would be more economical than high-presure steam. Investigations of system reliability, time ariation in load, economics, geographical inluences, and accuracy of calculations are recomnended. (Poertner)

FOUNDATION SETTLEMENT AND GROUND REACTION CALCULATIONS USING A DIGITAL COMPUTER,
Taylor Woodrow Construction Ltd. southall (England).
K. F. Zbirohowski-Koscia, and D. A. Gunasekera.
Civ Eng Pub Works Rev, Vol 65, No763, p 152-157, Feb 1970. 5 p, 10 fig, 4 ref.

Descriptors: *Foundations, *Settlement (Structural), Stress, *Computer programs, Soil mechanics, Soils, Numerical analysis, Deformation, Stress distribution, Soil properties, Flexible foundations, Calculations, *Soil pressure, Rigid foundations, Footings, Load distribution.
Identifiers: *Computer-aided design, Computer applications, Boussinesq equation, Spread footings, Compressible foundation, Mat foundations.

Three computer programs for calculating settlements and ground reactions under foundations on nonhomogeneous ground are described. The programs are based on 2 simplifying assumptions: (1) ground stress is distributed in accordance with the Boussinesq formula, and (2) Young's modulus of the ground at each level varies linearly between boreholes. The first program calculates settlement at several chosen points. The load causing the settlements is represented by a system of point loads. The second program calculates ground reactions and settlements under one or more rafts. This calculation proceeds in 2 stages for 2 extreme cases. In the first stage, ground reaction is assumed planar and independent of the rigidity of the raft. The optional second stage assumes that the raft is infinitely rigid compared to the ground. Ground reactions are progressively redistributed so that the ground deformation approaches a plane. The procedure is iterative and must be repeated until adequate precision is obtained. Average deformation, bending moments, and shearing forces are calculated for both cases. The third program repeats the operations of the second program but for rafts of finite rigidities. (USBR)

A CRITICAL STUDY OF THE THEORIES CONCERNING UPLIFT IN HYDRAULIC STRUCTURES ON PERVIOUS FOUNDATIONS,
College of Engineering, Madras (India).
V. C. Kulandaiswamy, and T. N. Ramaswamy.
13th Congr Int Assn Hydraul Res, Proc Vol 4, p 311-320, Aug-Sept 1969. 10 p, 5 fig, 10 ref.

Descriptors: *Uplift pressure, *Hydraulic structures, Dams, Pore water pressures, Theory, Hydrostatic pressure, Pore pressure, Seepage, Weirs, Foundations, Pervious soils, Soil mechanics, Percolation, Underseepage, Electric analogs.
Identifiers: Hydraulic uplift, Comparative studies.

Development of various theories concerning uplift under hydraulic structures on pervious foundations is traced. Creep theory and potential theory are reviewed. Uplift pressures calculated for a few weir profiles using methods proposed by Bligh, Lane, Khosla, and Chugaev are compared to pressures obtained using the electrical analogy method. Relative merits of the methods are discussed. Khosla's and Chugaev's methods, based on potential theory, gave satisfactory results. Khosla's method is restricted to cases of very deep foundations; Chugaev's method reduces the problem to a few simple equations and can be applied to foundations of limited and unlimited depths. Chugaev's method is particularly suitable for field application. (USBR)

LATERAL PRESSURES ON RIGID PERMANENT STRUCTURES,
Mueser, Rutledge, Wentworth and Johnston, New York.
James P. Gould.
Amer Soc Civ Eng Spec Conf Lateral Stresses in Ground and Design Earth Retaining Struct, Cornell Univ, Ithaca, N Y, June 1970. 51 p, 16 fig, 1 tab, 39 ref.

Descriptors: *Lateral forces, *Earth pressure, Walls, Movement, Loads (Forces), Locks, *Retaining walls, Docks, Foundations, Anchors, Passive pressures, Horizontal loads, Slope stabilization, Anchored bulkheads, Soil mechanics, Active pressures, Structural analysis, Soil pressure, Strain, Deflection, Bibliographies, Overconsolidation.
Identifiers: *Rigid structures, Slurry trenches, Design practices, At rest pressure, Swelling pressures, Soil-structure interaction.

Factors influencing lateral earth pressures on rigid retaining structures are reviewed, and analysis of walls of 5 categories of deep permanent structures are discussed. The 5 categories are: (1) cantilever retaining walls, (2) walls of U-frame locks and docks, (3) foundation walls of structures, (4) slurry trench concrete walls for foundation construction, and (5) rigid structures for slope stabilzation. Each category is discussed from the standpoint of providing some information to assist designers in the difficult judgments necessary in analyzing walls subjected to lateral earth pressures. Specific conclusions are presented for each category. General conclusions are that as substructures become larger and more complicated, soil-structure interaction becomes more important than the esoteric properties that the soil may potentially possess; and with ordinary U S soil types lacking great sensitivity, lateral earth pressures can be rationalized from a knowledge of construction methods and structural characteristics, and no especially startling or unexpected loadings are likely. RHEOLOGICAL AND ULTIMATE STRENGTH PROPERTIES OF COHESIVE SOILS,
Kentucky Dept. of Highways, Lexington. Div. of Research.
Gordon D. Scott.
Available from NTIS as PB-191 368, $3.00 in paper copy, $0.65 in microfiche. Kentucky Highway Dept. Interim Research Report KYHPR 65-38, HPR 1 (4), Part II, Feb 69. 96 p.

Descriptors: *Soil strength, Soil density, *Soil tests, Soil stability, *Roadbanks.
Identifiers: Viscoelasticity.

Results of a laboratory study on strength properties of undisturbed and remolded soils is reported. The purpose of the study was to demonstrate that an accurate failure envelope could be developed by testing a single specimen. Thirty-one undisturbed samples were tested in unconfined compression, consolidation, triaxial, and stress relaxation. Eighty remolded specimens (sixty were kaolin) were tested similarly and, in addition, were subjected to a special series of relaxation-triaxial tests. Stress relaxa-

tion was measured for one hour after straining the 4 in. long specimen 0.01-inch. Triaxial specimens were tested by applying an axial load at the rate of 2 percent per hour. (BPR)

ON GEOLOGICAL AND TECHNOLOGICAL ASPECTS OF ORIENTED N-SIZE CORE DIAMOND DRILLING,
Newcastle Univ. (Australia); and Broken Hill Proprietary Co. Ltd., Shortland (Australia).
K. H. R. Moelle, and J. D. Young.
Eng Geol, Vol 4, No 1, p 65-72, Jan 1970. 8 p, 1 fig, 11 ref.

Descriptors: Drill holes, *Drilling, *Drilling equipment, Boreholes, Mining, *Core drilling, *Cores, Orientation, Petrofabrics, Coal mines, Mining engineering, Petrographic investigations, Engineering geology, Rock mechanics, Subsurface investigations, Geologic investigations.
Identifiers: *Diamond drilling, *Core recovery, Australia, Foreign products, *Oriented cores.

A device has been developed to obtain oriented N-size diamond drill cores from relatively deep slim holes. The device fits into a standard N-size vertical hole (3-in. dia) and may be operated using standard diamond drilling equipment. The equipment consists of a preset mechanical timer, compass unit with a paper chart recorder, diamond scribers for marking the core, and a core lifter. The procedure for obtaining oriented cores is described. Improvements in design have overcome the problem of straining the core, which has made some cores unfit for petrofabric analysis. Experiences using the device in Australian coal mining and applications to mining geology are discussed. (USBR)

CROSSING THE SIERRA MADRE FAULT ZONE IN THE GLENDORA TUNNEL, SAN GABRIEL MOUNTAINS, CALIFORNIA,
Southern California Metropolitan Water District, Los Angeles.
R. J. Proctor, C. Marshall Payne, and D. C. Kalin.
Eng Geol, Vol 4, No 1, p 5-8, 57-63, Jan 1970. 13 p, 6 fig, 1 tab, 9 ref.

Descriptors: *Tunnels, *Engineering geology, Geologic investigations, *Faults (Geology), Subsurface investigations, Geologic mapping, Field investigations, Earthquakes, Exploration, Alinements, Landslides, Rock properties.
Identifiers: Glendora Tunnel, Calif, Geologic maps, Geologic profiles.

An excellent opportunity to observe and study a major fault zone was provided in 1966 during construction of the 6.2-mi Glendora Tunnel in California. The Sierra Madre fault zone extends for 55 mi along the steep front of the San Gabriel Mountains. As mapped in the tunnel, the fault zone has an apparent thickness of 520 ft. Within the fault zone are oil-stained brecciated Puente shale, and slivers of Precambrian gneiss and Cretaceous granite that have been thrust at least 700 ft over quaternary terrace deposits. A puzzling situation was encountered in the east portal area where drill holes showed terrace gravels 370 ft beneath apparent basement rocks. This feature was attributed to a thrust fault. Geologic investigations proved that a longer tunnel route would cost several million dollars less to build because of poor rock conditions along a shorter route. Tunnel construction was not adversely affected by the fault materials encountered, but was affected by bentonite shale adjacent to the fault zone. (USBR)

CONTROL AND REPAIR OF CRACKS IN CONCRETE DAMS,
Bureau of Reclamation, Denver, Colo.
B. P. Bellport.
Int. Comm. on Large Dams, 9th Congress (Paper) Q.39-R.12 Montreal, Can, p 199-217, June 1970. 19 p, 1 fig.

Descriptors: *Cracking, *Cracks, *Repairing, Concrete control, Mixes, Concrete mixes, *Concrete dams, Concrete placing, Control, Contraction joints, Construction joints, Expansion joints, Mass concrete, Curing, Precooling, *Temperature control, Shrinkage, Expansion, Grouting, Cement grouting, Heat of hydration, Chemical grouting, Concrete technology.
Identifiers: *Crack control, Control joints, *Construction control, Cooling systems, Volume change, Cement hydration, Epoxy mortar.

Causes of cracking in concrete dams, control methods used by the Bureau of Reclamation to control and minimize cracking, and measures used to repair cracks are discussed. Most cracking in mass concrete occurs because of stresses caused by restraint against volumetric changes including temperature change, drying shrinkage, and autogenous shrinkage. Primary control methods are mix design, temperature control, and use of contraction, expansion, and construction joints. Because of the heat generated by hydration of the cement, the concrete mix selected one should provide the required strength and durability with the lowest cement content. Expansion and contraction joints are used to accommodate volumetric changes. Construction joints are used to facilitate construction and to reduce cracking tendencies. Temperature control measures used are precooling concrete ingredients, postcooling by means of embedded pipe systems, and restricting the time or season of concrete placement. Pressure injection of portland cement grout is the most economical method of repairing cracks. Epoxy grouts stop leaks and can restore the structural strength of concrete, but cracks must be dry for effective bonding. Chemical grouts have been used to seal small cracks. (USBR)

A REVIEW OF STRESS-STRAIN RELATIONSHIPS FOR CONCRETE,
Northern Arizona Univ., Flagstaff.
Sandor Popovics.
J Amer Concr Inst, Proc Vol 67, No 3, p 243-248, Mar 1970. 6 p, 2 fig, 2 tab, 35 ref, append.

Descriptors: *Concretes, *Concrete technology, Concrete testing, Axial loads, Axial stress, Compressive strength, *Deformation, Strain, Stress, Flexural strength, Elasticity modulus, Reviews, Bibliographies, *Stress-strain curves, Reinforced concrete, Strength of materials, Cracking.
Identifiers: *Concrete properties, Compressive stress, Formulas, Crack propagation.

A state-of-the-art survey is presented to provide an organized summary, analysis, and evaluation of knowledge on the instantaneous axial deformation of concrete under load. The shape of the stress-strain curve and the numerical approximation of the stress-strain diagram are discussed. The instantaneous deformation of concrete under load is influenced by testing conditions and composition of the concrete. The deformation mechanism is explained qualitatively by the theory of internal crack propagation; under short-time loading, the stress-strain curve deviates from the straight line mainly because of progressive internal cracking. The theory of internal cracking can only provide a qualitative description, and empirical formulas are used for numerical approximations. The limits of validity and degree of approximation for empirical formulas are given. Empirical formulas are also available for estimating unit strain and secant modulus of elasticity at the ultimate compressive strength. Has 35 references. (USBR)

CONSERVATION OF CRAFT SKILLS IN DESIGN,
Bureau of Reclamation, Denver, Colo.
C. F. Palmetier.
Annu Meet Amer Concr Inst, Chicago, Ill, Mar-Apr 1969. 12 p, 4 fig.

Descriptors: Construction, *Crafts, Concretes, *Labor, *Construction costs, Concrete placing, *Concrete construction, Concrete mixes, Steel, *Designers, Concrete plants, Formwork (Construction), Reinforcing steel, Costs, Cleaning, Optimum use, Optimization, *Structural design, Systems analysis, Architecture, *Architects.
Identifiers: *Building design, Design improvements, Spacing, Ready-mix concrete, Form removal, Systems engineering.

For several years the construction industry has experienced change in basic concepts. This change is the substitution of machine power for human power whenever possible. The principal reason for the change is that today's highly skilled workmen are used most economically when their skills and not their muscles are exploited. While the use of available skills is basically the construction contractor's problem, the design engineer has the responsibility to give the contractor the opportunity for optimum use of the skills and power of his craftsmen. For example, with construction contractors proposing unit prices for concrete of $200 and more, the designer must recognize that the cheapest components of structural concrete are cement and aggregate. Costs arise from wasteful use of highly skilled workmen in fabricating and setting intricate forms and unnecessary requirements for placing concrete in confined and congested forms. Perhaps the highly publicized systems approach to design should be expanded or complemented by a designer's systems approach to the efficient use of on-site labor. (USBR)

DETAILING BY COMPUTER,
Zinn (W.V.) and Association (Great Britain).
W. V. Zinn, and L. Rosten.
Civ Eng Pub Works Rev, Vol 65, No 763, p 142-145, Feb 1970. 4 p, 6 fig, 2 ref, 2 append.

Descriptors: *Continuous beams, *Concrete structures, Plates, Computer programs, Beams (Structural), Reinforced concrete, Computers, Structural design, *Reinforcing steel, *Structural members, Calculations, Design tools, Slabs.
Identifiers: *Computer-aided design, *Design practices, Computer applications, Concrete slabs.

A method using a computer to design and detail reinforced concrete continuous beams, plates, and slabs is described. The output is in tabular form to be used directly on site in conjunction with standardized fixing diagrams. The system has been designed to limit office drawing effort to the production of outlines of the structural concrete and to allocate to the computer the task of providing a full set of calculations and detailing instructions that will replace traditional reinforcement detail drawings. This system and further developments will form eventually the basis of a universal detailing process in which the productivity of the office drawing staff and site labor will be increased greatly. The work described is in the pioneer stage, but sufficient experience has been gained to show that the system is practicable and will become more valuable when a greater degree of rationalization is developed in architectural planning. 8G. Materials

FLY ASH UTILIZATION CLIMBING STEADILY.

Environ Sci Technol, Vol 4, No 3, p 187-189, Mar 1970. 3 p, 3 fig.

Descriptors: *Fly ash, Coals, Thermal powerplants, *Byproducts, *Solid wastes, Lightweight aggregates, Pozzolans, *Waste disposal, Research and development, Cements, Bricks, Concrete technology, Concretes, Masonry.
Identifiers: Concrete blocks, Pollution control, Reuse.

Most pollution control programs eventually evolve into an ultimate disposal program--getting rid of waste material having little or no economic value. For the electric utility industry, the ultimate disposal problem involves mountains of ash residue that accumulate at coal burning power stations. Fortunately, 17% of the fly ash is recovered for byproduct reuse, and the rate of utilization is rising. Present uses include: pozzolan in concrete, raw material for sintered lightweight aggregate, filler for asphalt, soil stabilization, and hydrated lime-fly ash compounds as base courses for roads. Promising new applications are raw material for cement manufacture, and manufacture of face brick. Fly ash brick is fully competitive with conventional clay brick in strength, performance, appearance, and price, and is 15% lighter. A fly ash processing plant is being built at Hamilton, Ontario, to process the entire 450-tpd fly ash output from Ontario Hydro's Lakeview coal burning power station. The processing plant will produce a uniform, graded product of consistent specifications. About 60% of the ash will be used for sintered aggregate, 15% will be used for pozzolan, and the remainder will be an iron-rich concentrate for steel and other industrial uses. (USBR)

8H. Rapid Excavation

COMPLEX EQUIPMENT FOR SINKING AND DRILLING OF VERTICAL SHAFTS,
National Science Foundation, Washington, D.C. Special Foreign Currency Science Information Program.
N. A. Malevich.
Available from NTIS as TT-68-50609, $3.00 in paper copy, $0.65 in microfiche. Trans. of Kompleksy Oborvdovaniya Dlya Prokhodki i Bureniya Vertikal'nikh Stvolov. Clearinghouse Translation TT68-50609, 1969. 383 p. NSF-C466.

Descriptors: *Core drilling, *Drilling equipment, *Shafts (Excavation).
Identifiers: Vertical shafts, Shaft boring.

The designs, bases underlying the theory and calculation, results of experimental studies of Soviet and foreign complex assemblies of equipment and machines meant for sinking and boring shafts have been examined in the book. The book also discusses the technological schemes and technoeconomic indices of mechanized sinking of shafts, generalizes the experience gained by application and results of field trials of complex assemblies of sinking and boring equipment, indicates the future course of development of complex mechanization of work on installation of vertical shafts.

9A. Education (Extramural)

RESEARCH ON WATER QUALITY,
California Univ., Davis.
Ray Coppock.
California University Water Resources Center Report No 19, July 1970. 36 p.

Descriptors: *Water quality, *Research facilities, *Projects, *Universities, *California, Education, Laboratories, Model studies, Water Resources Research Act.
Identifiers: University of California.

A brief summary is given, as of mid-1970, of University of California research involving water quality. Preliminary or final results, or at least progress reports, are available for all UC research projects on water quality that have continued for more than a few months. They may be found in technical or semi-technical journals, in University publications, in reports of research units such as the Water Resources Center and the Sanitary Engineering Research Laboratory, or in reports to funding agencies. Scientific projects are described under five headings: measuring and monitoring water quality; biostimulation and other ecological aspects; water quality control and management; sewage and wastewater treatment; and drainage and groundwater quality. CHAPTER 3: EDUCATION AND THE ENVIRONMENT.
National Academy of Sciences-National Academy of Engineering, Washington, D.C. Environmental Studies Board.

In: Institutions for Effective Management of the Environment, Washington, D.C. National Academy of Sciences - National Academy of Engineering, January 1970, p 29-36.

Descriptors: *Environment, *Education, Social needs, Universities, Colleges, Management, Planning.
Identifiers: *Environmental coalition, Multidisciplinary programs, Public information.

Successful efforts to conserve our national resources and manage the environment more effectively will depend in large measure on our ability to train people to understand and to cope with the related complex technical and social problems, as well as to develop and implement programs for the distribution of information on a broad scale. Several suggestions are forwarded. First, it recommended that the National Science Foundation undertake to develop and sponsor a Junior Environmental Education Program at secondary school level designed to involve teenage youngsters with the whole range of environmental problems. Second, to facilitate environmental science in the universities, two approaches are suggested: (1) Creation of multidisciplinary programs of environmental affairs within existing universities, to be funded in part by federal grants; and (2) Establishment of an experimental problem-oriented graduate school to be supported in part by a proposed Environmental Coalition. Third, methods are suggested which can aid in the general education of the public. Finally, the establishment of an Environmental Coalition is suggested. This organization would coordinate and achieve support for all relevant publicly instigated programs and activities. (See also W70-08929) (Davis-Chicago)

9C. Research Facilities

REPORT OF WATER RESOURCES RESEARCH, JULY 1, 1968 - JUNE 30, 1969.
Geological Survey, Washington, D.C. Water Resources Div.
U S Geological Survey 7th Annual Report on Water Resources Research, January 1970. 387 p, 16 fig.

Descriptors: *Projects, *Water resources development, Research and development, Research facilities, International Hydrological Decade, Federal government, Tracers, Hydrology, Tracking techniques, Streamflow, Groundwater movement, Estuaries, Water quality, Hydrologic cycle, Planning, Water management (Applied), Data collections.
Identifiers: *U S Geological Survey, *Water resources research.

This, the seventh annual report on water resources research conducted by the Water Division, U. S. Geological Survey, presents information on the status of the 'core' research program of the Division. Much of the program is basic research aimed at developing an understanding of the workings of particular parts of the hydrologic cycle. Another large part of the activity is in water quality management and protection, in which much of the research deals with movement of radioactive material in the water cycle. The third important field is in new methods of collecting, analyzing, and interpreting hydrologic data. Some project activities are associated with the International Hydrological Decade program (IHD). This report is intended primarily for use by the Geological Survey and is distributed only to members of the Survey staff, advisory committees, and others with special interest in development of water resources research. FLOOD DAMAGE PREVENTION.
Tennessee Valley Authority, Knoxville.

Tennessee Valley Authority Indexed Bibliography, 6th Edition, July 1969. 43 p, 1 fig, 407 ref, index.

Descriptors: *Bibliographies, *Flood protection, *Non-structural alternatives, *Flood plain zoning, Flood plain insurance, Flood control, Warning systems, Water law, Regulation, Legislation, Zoning.
Identifiers: Flood damage prevention (Bibliography).

A bibliography and index are presented of recent literature on both structural and nonstructural methods of flood damage prevention and control. The majority of the entries emphasize flood damage prevention and flood plain regulation, with only a few items on flood control. Most of the publications cited are available on inter-library loan from the TVA Technical Library, Knoxville, Tenn. (Knapp-USGS)

THE EFFECT OF BIOLOGICAL LIFE ON THE DISSOLVED OXYGEN CONCENTRATION IN THE DELAWARE RIVER,
W70-09189 05C

BICLOGICAL TREATMENT
EFFECTIVE PHOSPHORUS REMOVAL BY THE ADDITION OF ALUM TO THE ACTIVATED SLUDGE PROCESS,
W70-09186 05D

REDUCING WASTE ACTIVATED SLUDGE VOLUME BY ANEROBIOSIS,
W70-09187 05D

BAFFLED BIOLOGICAL BASIS FOR TREATING POULTRY PLANT WASTES,
W70-09320 05D

THE SEASONAL PERFORMANCE AND THE PATTERNS OF CHEMICAL AND BIOLOGICAL EVENTS IN SEWAGE LAGOONS,
W70-09333 05D

THERMAL ENERGY CONSERVATION AND SEQUENTIAL BIOLOGICAL PROCESSING APPLIED TO SEWAGE LAGOON DESIGN,
W70-09334 05D

EFFECT OF TOXIC WASTES ON TREATMENT PROCESSES AND WATERCOURSES,
W70-09341 05D

MICROBIOLOGY OF A WASTE STABILIZATION POND,
W70-09508 05D

BIPOLAR TRANSMISSION LINES
TRANSIENT OVERVOLTAGE ON A BIPOLAR HVDC OVERHEAD LINE CAUSED BY DC LINE FAULTS,
W70-09018 08C

BIRDS
WATER ECONOMY OF THE GREEN-TAILED TOWHEE (CHLORURA CHLORURA),
W70-09149 02I

BLIGHTS
THE EFFECT OF SOIL MOISTURE LEVEL OF THE INCIDENCE OF EARLY BLIGHT ON POTATO AND TOMATO PLANTS,
W70-09137 02I

BOARD OF ENVIRONMENTAL AFFAIRS
CHAPTER 6 FEDERAL ORGANIZATION FOR MANAGING THE ENVIRONMENT.
W70-09444 06E

BODY FLUIDS
HEART RATE AND CHANGES IN BODY FLUIDS IN AESTIVATING TOADS FROM XERIC HABITATS,
W70-09148 02I

BORDER IRRIGATION
ON USING A TIME VARIABLE INFILTRATION WITH THE ISRAELSON BORDER IRRIGATION EQUATION,
W70-09141 03F

BOREHOLE GEOPHYSICS
BOREHOLE GEOPHYSICS AS APPLIED TO GROUNDWATER,
W70-09400 07B

BOTTOM SEDIMENTS
ISOPACHOUS MAPPING OF THE LOWER PATUXENT ESTUARY SEDIMENTS BY CONTINUOUS SEISMIC PROFILING TECHNIQUES,
W70-09390 02L

BOULDER CANYON PROJECT ACT
ARIZONA V CALIFORNIA (RELATIVE RIGHTS IN COLORADO RIVER WATER).
W70-09066 06E

BOUNDARIES(PROPERTY)
HONEBEIN V MONTICELLO (DEED TO LAKE FRONTAGE AS NOT EXTENDING OWNERSHIP TO LAKE BED).
W70-09054 06E

SANDERS V ROSE (PROPERTY BOUNDARY AS AFFECTED BY CHANGE IN COURSE OF STREAM).
W70-09059 06E

KUHN V CHESAPEAKE AND O RY (EFFECT OF CHANGE OF NATURAL WATERCOURSE ON PROPERTY BOUNDARIES).
W70-09076 06E

CARTER OIL CO V WATSON (BOUNDARY DISPUTE WHERE LAND CONVEYED BORDERED ON A STREAM).
W70-09077 06E

THOMAS E BISHOP CO V SANTA BARBARA COUNTY (MEANDER LINES AS BOUNDARIES).
W70-09082 06E

CITY OF NEW YORK V WILSON AND CO (EJECTMENT ACTION BY CITY SEEKING POSSESSION OF FILLED LANDS ORIGINALLY BELOW THE HIGH WATER MARK OF RIVER).
W70-09142 06E

LUPAS V BILZRY (POSSESSORY RIGHTS IN WATERFRONT PROPERTY).
W70-09323 06F

BOUNDARY DISPUTES
SANDERS V ROSE (PROPERTY BOUNDARY AS AFFECTED BY CHANGE IN COURSE OF STREAM).
W70-09059 06E

DICKSON V SANDEFUR (DISPUTED OWNERSHIP OF LAND APPEARING AFTER SUDDEN SHIFT IN RIVER'S COURSE).
W70-09060 06E

KUHN V CHESAPEAKE AND O RY (EFFECT OF CHANGE OF NATURAL WATERCOURSE ON PROPERTY BOUNDARIES).
W70-09076 06E

CARTER OIL CO V WATSON (BOUNDARY DISPUTE WHERE LAND CONVEYED BORDERED ON A STREAM).
W70-09077 06E

BLASK V SOWL (OWNERSHIP OF ISLANDS IN NAVIGABLE WATERS).
W70-09175 06E

BLISS V KINSEY (EXTENSION OF BOUNDARY LINES FROM MEANDER LINE TO SHORE LINE).
W70-09343 06E

BRANT LAKE SHORES, INC V BARTON (ADVERSE POSSESSION OF LAND BELOW THE HIGH WATER MARK).
W70-09355 06E

UNITED STATES V OTLEY (OWNERSHIP OF LAKE BEDS).
W70-09467 06E

BOUNDARY LAYERS
TURBULENT DIFFUSION IN A STABLY STRATIFIED SHEAR LAYER,
W70-09173 08B

BOVINE WASTE
A STUDY OF FARM WASTE, FARM ANIMAL WASTE CHARACTERIZATION, HANDLING, UTILIZATION,
W70-09426 05B

BOX CULVERTS
ELECTRONIC COMPUTER PROGRAM FOR HYDRAULIC ANALYSIS OF BOX CULVERTS (BPR PROGRAM HY-3),
W70-09445 08A

BP 1002
TOXICITY STUDIES WITH AN OIL-SPILL EMULSIFIER AND THE GREEN ALGA PRASINOCLADUS MARINUS,
W70-09429 05C

BREAKWATERS
WAVE ACTION AND BREAKWATER LOCATION, VERMILION HARBOR, OHIO HYDRAULIC MODEL INVESTIGATION,
W70-09178 08B

BRIDGES
PIKE RAPIDS POWER CO V MINNEAPOLIS ST P AND S S M RY (RELATIVE RIGHTS TO RIVER BED AS BETWEEN BRIDGE OWNER AND DAM OWNER).
W70-09081 06E

ANDERSON V HOBBS TIE AND TIMBER CO (TITLE TO BRIDGE RESTING UPON RIVER BED).
W70-09159 06E

UNITED STATES V WAUNA TOLL BRIDGE CO (OBSTRUCTION OF NAVIGABLE RIVERS).
W70-09466 04A

BRINE DISPOSAL
DISPOSAL OF BRINE BY SOLAR EVAPORATION FIELD EXPERIMENTS,
W70-09150 02D

BUBBLES
DETERMINATION OF PORE SIZE BY THE AIR BUBBLING PRESSURE METHOD,
W70-09297 07B

BUILDING DESIGN
CONSERVATION OF CRAFT SKILLS IN DESIGN,
W70-09033 08F

BULINUS TRUNCATUS
COMPARATIVE STUDIES OF THE MOLLUSCICIDAL EFFECT OF CUPROUS CHLORIDE AND COPPER SULFATE IN IRAN,
W70-09432 05C

BULKHEADS
CITY OF PHILADELPHIA V STANDARD OIL CO (USE OF PUBLIC BULKHEAD BY RIPARIAN OWNER).
W70-09483 04A

BULKING
INVESTIGATION ON THE CONTROL OF FILAMENTOUS BULKING,
W70-09509 05D

BUOYANCY
BUOYANT PLUMES AND THERMALS,
W70-09168 05B

BURIED CABLES
1969 HVDC STRAY CURRENT TESTS ON UNDERGROUND TELEPHONE CABLES,
W70-09015 08C

BURROWS
THE TERRESTRIAL ECOLOGY OF THE SPADEFOOT TOAD SCAPHIOPUS HAMMONDII,
W70-09146 02G

BYPRODUCTS
FLY ASH UTILIZATION CLIMBING STEADILY.

W70-09040 08G

ADMIUM
RELATION BETWEEN THE 'ITAI-ITAI' DISEASE AND THE POLLUTION OF RIVER WATER BY CADMIUM FROM A MINE,
W70-09427 05C

AIRATIONS
COMPARATIVE STUDY OF THE WATER BALANCE IN THE AERATED ZONES WITH RADIO-ACTIVITE METHODS AND WEIGHABLE LYSIMETER,
W70-09263 02G

MEASURING SOIL MOISTURE IN THE BRENIG CATCHMENT PROBLEMS OF USING NEUTRON SCATTER EQUIPMENT IN SOIL WITH PEATY LAYERS,
W70-09264 02G

AN INSTRUMENT FOR MEASURING SOIL MOISTURE BY NEUTRON SCATTERING,
W70-09265 07B

CHANGES IN THE MOISTURE CONTENT OF THE TOPSOIL AS MEASURED WITH A NEUTRON MOISTURE GAUGE,
W70-09266 02G

THE DETERMINATION OF SOIL MOISTURE WITH THE NEUTRON SCATTERING METHOD IN FINLAND,
W70-09267 07B

NEUTRON MOISTURE METER FOR SALINE SOILS,
W70-09268 07B

POLISH ISOTOPE APPARATUS FOR RESEARCH ON SOIL MOISTURE,
W70-09271 07B

A STUDY ON PRESSURE MEMBRANE PROPERTIES IN RELATION TO CAPILLARY CONDUCTIVITY MEASUREMENTS,
W70-09279 02G

ALIFORNIA
ARIZONA V CALIFORNIA (RELATIVE RIGHTS IN COLORADO RIVER WATER).
W70-09066 06E

THOMAS E BISHOP CO V SANTA BARBARA COUNTY (MEANDER LINES AS BOUNDARIES).
W70-09082 06E

SUMMARY OF GROUNDWATER OCCURRENCE IN CALIFORNIA,
W70-09214 02F

SOME EFFECTS OF FRESH-WATER INFLOW ON THE FLUSHING OF SOUTH SAN FRANCISCO BAY A PRELIMINARY REPORT,
W70-09215 05G

MOVEMENT OF SEABED DRIFTERS IN THE SAN FRANCISCO BAY ESTUARY AND THE ADJACENT PACIFIC OCEAN A PRELIMINARY REPORT,
W70-09216 02L

FLOOD PLAIN INFORMATION, SANTA CLARA RIVER, VENTURA COUNTY, CALIFORNIA.
W70-09221 04A

A SUMMARY OF PRELIMINARY STUDIES OF SEDIMENTATION AND HYDROLOGY IN BOLINAS LAGOON, MARIN COUNTY, CALIFORNIA,
W70-09235 02L

AGE OF QUATERNARY SEDIMENTS AND SOILS IN THE SACRAMENTO AREA, CALIFORNIA BY URANIUM AND ACTINIUM SERIES DATING OF VERTEBRATE FOSSILS,
W70-09239 02J

RESEARCH ON WATER QUALITY,
W70-09348 09A

FLOOD PLAIN INFORMATION, COYOTE CREEK, SAN FRANCISCO BAY TO ANDERSON RESERVOIR, SANTA CLARA COUNTY, CALIFORNIA.
W70-09365 04A

AMAL SEEPAGE
REDUCTION OF SEEPAGE LOSSES FROM IRRIGATION CANALS AS A RESULT OF SILTING,
W70-09043 03F

ANNERIES
ECONOMICS OF CANNERY WASTE TREATMENT,
W70-09338 05D

ANNERIES(PEACH)
REQUIREMENTS AND COSTS OF ALTERNATIVE SYSTEMS FOR TREATING PEACH CANNERY WASTES.
W70-09183 06C

APILLARY ACTION
MOISTURE CONTENT AND HYDROPHILITY AS RELATED TO THE WATER CAPILLARY RISE IN SOILS,
W70-09296 02G

APILLARY CONDUCTIVITY
CAPILLARY CONDUCTIVITY DATA ESTIMATED BY A SIMPLE METHOD,
W70-09277 07B

A STUDY ON PRESSURE MEMBRANE PROPERTIES IN RELATION TO CAPILLARY CONDUCTIVITY MEASUREMENTS,
W70-09279 02G

AN INFILTRATION METHOD FOR THE DETERMINATION OF THE CAPILLARY CONDUCTIVITY OF UNDISTURBED SOIL CORES,
W70-09281 07B

DETERMINATION OF CAPILLARY CONDUCTIVITY AND DIFFUSIVITY OF SOIL IN SITU,
W70-09282 02G

VERIFICATION OF THE GENERALIZED DARCY'S LAW AND DETERMINATION OF CAPILLARY CONDUCTIVITY AT THE BEGINNING OF HORIZONAL INFILTRATION (FRENCH),
W70-09286 02G

THE MICROHYDROLOGICAL CHARACTERIZATION OF SOILS,
W70-09289 02G

MOISTURE CONTENT AND HYDROPHILITY AS RELATED TO THE WATER CAPILLARY RISE IN SOILS,
W70-09296 02G

CAPILLARY WATER
THE NATURE OF THE MINIMAL WATER RETENTIVE CAPACITY,
W70-09302 02G

CAPITAL COSTS
CONTINUOUS COUNTERCURRENT ION EXCHANGE.
W70-09037 05F

CARBOHYDRATE BIODEGRADATION
SELF-PURIFICATION OF NATURAL WATERS FROM CARBOHYDRATES,
W70-09100 05B

CARBOHYDRATES
CONTROL MECHANISMS OPERATIVE IN A NATURAL MICROBIAL POPULATION SELECTED FOR ITS ABILITY TO DEGRADE L-LYSINE, II. EFFECTS OF FRUCTOSE AND RIBOSE IN BATCH SYSTEMS,
W70-09336 05D

CONTROL MECHANISMS OPERATIVE IN A NATURAL MICROBIAL POPULATION SELECTED FOR ITS ABILITY TO DEGRADE L-LYSINE, III. EFFECTS OF CARBOHYDRATES IN CONTINUOUS-FLOW SYSTEMS UNDER SHOCK LOAD CONDITIONS,
W70-09337 05D

CARBONATES
A STUDY OF THE HYDROCHEMICAL FACIES OF THE WILCOX AQUIFERS IN MISSISSIPPI,
W70-09095 02K

CARCINOGENIC COMPOUND
ALGAL CANCER AND CAUSAL SUBSTANCES IN WASTES FROM THE COAL CHEMICAL INDUSTRY,
W70-09437 05C

CARRIERS
MINERAL METABOLISM OF HALOPHYTES,
W70-09147 02I

CATHODIC PROTECTION
CATHODIC PROTECTION OF THE BONNEVILLE POWER ADMINISTRATION'S 34.5 KV SAN JUAN ISLANDS CABLE,
W70-09013 08C

INTERNAL CATHODIC PROTECTION OF WATER COOLED PLANT,
W70-09014 08C

CATTLE SKIN WASTE
CATTLE SKIN TANNERY WASTES TREATMENT IN A COMPLETELY MIXED ACTIVATED SLUDGE PILOT PLANT,
W70-09324 05D

CELL SAP
EFFECT OF VARIATIONS IN SUBSTRATE SALINITY ON THE WATER BALANCE AND IONIC COMPOSITION OF BEAN LEAVES,
W70-09144 02I

CELLULOSE
DEVELOPMENT OF REVERSE OSMOSIS MEMBRANES,
W70-09362 03A

CENTRAL CHERNOZEM REGION
WATER BALANCE AND SILTING OF SMALL RESERVOIRS IN THE CENTRAL CHERNOZEM OF THE RUSSIAN SOVIET FEDERAL SOCIALIST REPUBLIC.
W70-09312 02J

CENTRAL HEATING AND COOLING
SPACE HEATING IN URBAN ENVIRONMENTS,
W70-09192 08C

USES OF WASTE HEAT,
W70-09193 03C

CENTRIFUGAL PUMPS
FLOW OF ENTRAINED AIR IN CENTRIFUGAL PUMPS,
